

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

### Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

### About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at <http://books.google.com/>

## PREFACE

The contents of the present volume of the **NEW INTERNATIONAL YEAR BOOK**, the eleventh in the new series which began with the volume for 1907, are modified in many important respects by the entry of the United States into the war. Besides the account of that event which will be found in the articles **WAR OF THE NATIONS** and **UNITED STATES AND THE WAR** there are comprehensive accounts of the effect of the war in all fields of industrial, agricultural, educational, and economic activity. The article on **WAR OF THE NATIONS** is carried on along the lines that were laid down by Professor Carlton Hayes in preceding issues, containing as before a brief prefatory summary of events down to the beginning of the year. In the articles **AGRICULTURE**, **AGRICULTURAL LEGISLATION**, **FOOD CONTROL**, **FOOD AND NUTRITION** the various problems and developments in food production and distribution are discussed in detail. The effect of the war on industry is recounted in such articles as **CHEMISTRY (INDUSTRIAL)**, **SHIPPING**, **SHIPBUILDING**, **RAILWAYS**, and other titles that will readily occur to the reader; and the financial, economic, and social effects are treated in **FINANCIAL REVIEW**, **TAXATION**, **TARIFF**, **LABOR**, **LABOR LEGISLATION**, **TRADE UNIONS**, **STRIKES**, **INSURANCE**, **UNEMPLOYMENT**, etc. Matters of specifically military and naval interest are discussed as before under such headings as **MILITARY PROGRESS**, **NAVAL PROGRESS**, **BATTLESHIPS**, **SUBMARINES**, **AËRONAUTICS**, etc. Other articles that may be mentioned as dealing with striking features of the year are **RUSSIA**, which contains an account of the **RUSSIAN REVOLUTION**, the articles on each of the countries at war, the articles **INTERNATIONAL ARBITRATION AND PEACE**, **MILITARY SURGERY**, **HALIFAX DISASTER**, **UKRAINE**, **SUBMARINE OPERATIONS**, and **LIQUOR REGULATION**. Aside from the necessary changes in proportion resulting from this crisis in our history the present volume retains all the essential features of preceding issues; that is to say, being designed as an encyclopædia of the year it includes many classes of information not to be found in other annual volumes. For example among the departments not included or less fully treated in other such works are **BIOGRAPHY**, **AGRICULTURE**, **POLITICAL HISTORY** at home and abroad, **SOCIETIES**, and **RELIGIOUS BODIES**. Its large size and the exclusion of matters not pertaining to the year or not derived from the latest available information makes this possible.

FRANK MOORE COLBY.

LIST OF CONTRIBUTORS

**AGRICULTURE, BOTANY, FOOD, FORESTRY, HORTICULTURE, IRRIGATION, ETC.**

EDWIN WEST ALLEN, PH.D.,  
UNITED STATES DEPARTMENT OF AGRICULTURE;  
ASSISTED BY EXPERTS IN THE DEPARTMENT OF AGRICULTURE,  
AND  
ALFRED CHARLES TRUE, PH.D.,  
UNITED STATES DEPARTMENT OF AGRICULTURE.

**ANTHROPOLOGY (WITH ETHNOLOGY)**

ROBERT T. LOWIE, PH.D.,  
AMERICAN MUSEUM OF NATURAL HISTORY,  
AND  
CLARK WISSLER, PH.D.,  
AMERICAN MUSEUM OF NATURAL HISTORY.

**ARCHÆOLOGY**

OLIVER SAMUEL TONKS, PH.D.,  
PROFESSOR OF ART, VASSAR COLLEGE.

**ARCHITECTURE**

C. MATLACK PRICE,  
FORMERLY EDITOR OF THE *Architectural Record*.

**ASTRONOMY; METEOROLOGY**

T. W. EDMONDSON, PH.D.,  
PROFESSOR OF MATHEMATICS, NEW YORK UNIVERSITY.

**CHEMISTRY (GENERAL)**

G. C. SPENCER, PH.D.,  
BUREAU OF SOILS, DEPARTMENT OF AGRICULTURE.

**CHEMISTRY (INDUSTRIAL); EXPOSITIONS**

MARCUS BENJAMIN, PH.D., SC.D., LL.D.,  
EDITOR FOR THE UNITED STATES NATIONAL MUSEUM.

**CIVIL ENGINEERING AND MANUFACTURING SUBJECTS; AERONAUTICS, ETC.**

HERBERT TREADWELL WADE.

**DRAMA (AMERICAN AND ENGLISH)**

CLAYTON HAMILTON, M.A.,  
DRAMATIC CRITIC OF THE *Bookman*.

**ECONOMIC, SOCIAL, AND POLITICAL SCIENCE SUBJECTS**

FRANK HAMILTON HANKINS, PH.D.,  
PROFESSOR OF POLITICAL AND SOCIAL SCIENCE,  
CLARK COLLEGE, AND PROFESSOR OF SOCIOLOGY,  
CLARK UNIVERSITY.

**EDUCATION IN THE UNITED STATES; UNIVERSITIES AND COLLEGES**

MILO B. HILLEGAS, PH.D.,  
COMMISSIONER OF EDUCATION OF VERMONT.

**ELECTRICAL ENGINEERING SUBJECTS**

REGINALD GORDON,  
ASSOCIATE EDITOR OF *Industrial Management*.

**EXPLORATION; POLAR RESEARCH; ALASKA**

A. W. GREELY, PH.D.,  
MAJOR GENERAL, UNITED STATES ARMY; COMMANDER GREELY POLAR EXPEDITION.

**FOREIGN GAZETTEER**

EDWARD LATHROP ENGLE,  
AND  
ALLAN EVA ENGLE.

**FRENCH LITERATURE**

ALBERT SCHINZ, PH.D.,  
PROFESSOR OF FRENCH LITERATURE, SMITH COLLEGE.

**GEOLOGY; MINERALOGY**

DAVID HALE NEWLAND, A.B.,  
ASSISTANT STATE GEOLOGIST OF NEW YORK.

**GERMAN LITERATURE**

AMELIA VON ENDE.

**INTERNATIONAL PEACE AND ARBITRATION**

CLINTON ROGERS WOODRUFF, LL.B.,  
SECRETARY OF THE NATIONAL MUNICIPAL LEAGUE AND MEMBER OF THE MOHONK CONFERENCE; PRESIDENT OF THE BOARD OF PERSONAL REGISTRATION, PHILADELPHIA.

**ITALIAN LITERATURE**

ALBERT ARTHUR LIVINGSTON, PH.D.,  
PROFESSOR OF ROMANCE LANGUAGES, WESTERN UNIVERSITY, LONDON, CANADA.

**JEWES AND JUDAISM**

MEYER WAXMAN, PH.D.,  
RABBI, ALBANY, N. Y.

**LIBRARY PROGRESS**

WILLIAM W. BISHOP, A.M.,  
LIBRARIAN, UNIVERSITY OF MICHIGAN.

**LITERATURE, ENGLISH AND AMERICAN**

DAVID LAMBUTH, A.M.,  
ASSISTANT PROFESSOR OF ENGLISH, DARTMOUTH COLLEGE.

**LITERATURE (CONTINENTAL):** SEE  
**FRENCH LITERATURE; GERMAN LIT-  
ERATURE; ETC.**

**MEDICAL SUBJECTS**

ALBERT WARREN FERRIS, A.M., M.D.,  
CONSULTING PHYSICIAN OF THE ITALIAN HOS-  
PITAL, NEW YORK, AND OF THE BINGHAMTON  
STATE HOSPITAL; FORMERLY PRESIDENT OF THE  
NEW YORK STATE COMMISSION IN LUNACY AND  
MEDICAL EXPERT TO THE STATE RESERVATION  
COMMISSION AT SARATOGA SPRINGS.

**MILITARY PROGRESS**

RICHARD T. COINER, LIEUTENANT COLONEL,  
CORPS OF ENGINEERS, UNITED STATES ARMY;  
ASSISTANT PROFESSOR OF CIVIL AND MILITARY  
ENGINEERING, UNITED STATES MILITARY ACADEMY.

**MUSIC**

ALFRED REMY, M.A.,  
EXTENSION LECTURER, COLUMBIA UNIVERSITY,  
AND FORMERLY PROFESSOR OF HARMONY AND  
COUNTERPOINT, INTERNATIONAL CONSERVATORY,  
NEW YORK; EDITOR OF BAKER'S *Biographical  
Dictionary of Musicians*.

**NAVAL PROGRESS AND RELATED SUB-  
JECTS**

LEWIS SAYRE VAN DUZER,  
CAPTAIN, U. S. N., RETIRED; WRITER ON NAVAL  
AND NAUTICAL SUBJECTS.

**PAINTING AND SCULPTURE**

GEORGE KRIEHN, PH.D.,  
EXTENSION LECTURER IN THE HISTORY OF ART,  
COLUMBIA UNIVERSITY; LECTURER, WOMAN'S  
ART SCHOOL, COOPER UNION.

**PHILOLOGY (CLASSICAL)**

CHARLES KNAPP, PH.D.,  
PROFESSOR OF CLASSICAL PHILOLOGY, BARNARD  
COLLEGE, COLUMBIA UNIVERSITY.

**PHILOLOGY (MODERN)**

JOHN LAWRENCE GERIG, PH.D.,  
ASSOCIATE PROFESSOR OF CELTIC, COLUMBIA  
UNIVERSITY.

**PHILOSOPHY**

HERBERT W. SCHNEIDER,  
DEPARTMENT OF PHILOSOPHY, COLUMBIA UNI-  
VERSITY.

**PHYSICS**

HENRY D. HUBBARD,  
SECRETARY, UNITED STATES BUREAU OF STAND-  
ARDS.

**PSYCHOLOGY; PSYCHICAL RESEARCH**

EDWARD BRADFORD TITCHENER, D.Sc.,  
PH.D., LL.D., AND LITT.D.,  
SAGE PROFESSOR OF PSYCHOLOGY, GRADUATE  
SCHOOL OF CORNELL UNIVERSITY,  
AND  
HARRY PORTER WELD, PH.D.,  
ASSISTANT PROFESSOR OF PSYCHOLOGY, COR-  
NELL UNIVERSITY.

**RAILWAYS**

WILLIAM E. HOOPER,  
ASSOCIATE EDITOR, *Railway Age Gazette*.

**RELIGIOUS DENOMINATIONS**

JOHN W. RUSSELL, M.A., \*  
IRWIN S. GUERNSEY

**SANITARY ENGINEERING AND MUNICI-  
PAL SUBJECTS**

MOSES NELSON BAKER, PH.B., C.E.,  
EDITOR OF THE *Engineering News-Record*.

**SCANDINAVIAN LITERATURE**

HARRY V. E. PALMBLAD, A.M.,  
PROFESSOR OF MODERN LANGUAGES, CARTHAGE  
(ILL.) COLLEGE.

**SPANISH LITERATURE**

JOHN DRISCOLL FITZ-GERALD, PH.D.,  
MEMBER OF THE HISPANIC SOCIETY OF AMERI-  
CA; CORRESPONDING MEMBER OF THE SPANISH  
ROYAL ACADEMY AND OF THE ROYAL ACADEMY  
OF HISTORY OF MADRID; PROFESSOR OF SPANISH,  
UNIVERSITY OF ILLINOIS.

**SPORTS**

CHARLES A. TAYLOR,  
MEMBER OF THE STAFF OF THE *New York Tri-  
bune*.

**UKRAINE**

FELIX VEXLER, A.M.,  
LIBRARIAN, SCHOOL OF PHILOSOPHY, COLUMBIA  
UNIVERSITY.

**UNIVERSITIES AND COLLEGES (SEPA-  
RATE ARTICLES)**

LEVERING TYSON, M.A.,  
EXECUTIVE SECRETARY, ALUMNI FEDERATION,  
COLUMBIA UNIVERSITY.

**WAR OF THE NATIONS**

NELSON P. MEAD, PH.D.,  
ASSOCIATE PROFESSOR OF HISTORY, CITY COLLEGE  
OF NEW YORK,  
IRWIN S. GUERNSEY.

**ZOOLOGY; FISH AND FISHERIES**

AARON L. TREADWELL, PH.D.,  
PROFESSOR OF BIOLOGY, VASSAR COLLEGE.

\* Deceased.

WAR OF THE NATIONS: American Commission to the Allied War Conference at Paris . . . . .	768
WAR OF THE NATIONS: Hangars of an Important Aëronautic Station at the West Front; Observation ("Sausage") Balloon with Observer About to Ascend . . . . .	772

NOTE: Cross references in SMALL CAPITALS indicate that the allusion is to a separate article; cross references in *italics* denote that the reference is to a subdivision of a main article. A cross reference in *italics*, standing alone in an article, carries the reference to another subdivision of the same article. The letters q. v. (*quod vide*=Latin "which see") in parentheses following a word, indicate that the subject is treated under its own name elsewhere in the volume.

NOTE: In certain tables in this work it will be found, by addition, that the totals do not correspond to the sum of the items. This is the result of the omission or inclusion of certain small items which are not mentioned in the table, but are included in the totals. This is a usage frequently employed in the compilation of government statistics, from which sources the greater number of the tables in the YEAR BOOK are taken.

# THE NEW INTERNATIONAL YEAR BOOK

**ABRAMOVITZ, JACOB SHOLOM.** A Jewish author, often called the grandfather of Yiddish Literature, died December 14, 1917, at Odessa, Russia. He was born in the Government of Minsk, Lithuania, Russia, December 28, 1835, and was educated principally by his father. At an early age he attained a remarkable knowledge of the Talmud and the Bible. His first literary effort, *The Proper Verdict*, was a criticism of the Jewish literature of his day, and was published in 1860. His object was to show that his co-religionists did not live up to their privileges and were lacking in aggressiveness. He traveled extensively about his native country, keenly studying Jewish life, with which his novels largely dealt. He also wrote much on politics and history, and his outspoken criticism of public men and their work made him feared in high places. But his main object was to instill courage and initiative into the Jews. Among his numerous works, besides *The Proper Verdict*, were: *The Travels of Benjamin the Third*, a study of the non-progressive spirit of the Jew; *The Horse*, an attack on the Russian government; *The Book of Revivals*; *Solomon*; and *The Son of Herman*. With the death of Abramovitz there passed the last of the great Russian Jewish writers of the older school.

**ABYSSINIA.** A country of northern Africa, occupying a highland region southwest of the Red Sea. The country is made up of a number of states, the chief of which are Tigré in the north, Amhara in the west and centre, and Shoa in the south.

The total area of Abyssinia and its dependencies may be reckoned at 350,000 square miles, with a population variously estimated (8,000,000 according to some authorities). The boundaries of the empire are defined on the west, north, and northeast, where they touch, in order: the Sudan; the Italian colony of Massaua (Eritrea); the French Somali Coast; and the British Somaliland Protectorate. Northwards the boundary is about 15° 30' N. lat., falling just south of Kassala. By the treaty between the United Kingdom and Ethiopia of May 15, 1902, the frontier between Ethiopia and the Sudan was fixed at a line drawn from Khor Um Hagar on the river Setit to Gallabat, thence to the Blue Nile, Baro, Pibor, and Akobo rivers to Melile, and onwards to the intersection of the 6° N. lat. with 35° E. long. The southern frontier, bordering the British East Africa and Uganda protectorates, was defined by treaty

of December 6, 1907, and the frontier bordering the Italian colony of Benadir, by convention of May 16, 1908.

On July 6, 1906, an agreement between Great Britain, France, and Italy, as to their interests in Abyssinia, was concluded, and signed on December 13, 1906. It provided for the maintenance of the political and territorial status quo and of the open door. The three Powers agreed to join, in case of necessity, in safeguarding the interests of Great Britain and Egypt in the basin of the Nile, of Italy in Eritrea, Somaliland, and Benadir, and of France in the Somali Protectorate and hinterland and the zone necessary for the construction and working of the railway from Jibuti to Addis Abeba. They also agreed that a French company, approved by the French government, should construct the second section of the railway from Diré Dawa to Addis Abeba (continuing the existing French line from Jibuti to Diré Dawa) with a branch line to Harrar; but it was provided that the subjects of the three Powers should enjoy equal treatment regarding trade and traffic on the railway and at the port of Jibuti. Railways west of Addis Abeba were to be constructed by Great Britain, which had the right to construct a line from British Somaliland across Abyssinia to the Sudan. Italy might connect Benadir by railway with Eritrea.

The Abyssinians are Christians and their kings claim descent from Menelek, the son of Solomon by the Queen of Sheba. The principal occupations of the people are agriculture, cattle breeding, and hunting; the chief exports are coffee, honey, civet, wax, gums, spices, hides, rubber, ivory, and gold. The currency is the Maria Theresa (Austrian) dollar, but Indian rupees also find some circulation in Harrar, and a Menelek dollar is in circulation. Abyssinian trade passes principally through the port of Jibuti in French Somaliland; and in part through Massaua in Eritrea, Zaila in British Somaliland, and Gambela on the Sudan frontier. Manufactures are limited to coarse cotton and woolen cloths, leather, pottery, and some iron, steel, and other metal articles.

Menelek II proclaimed his grandson, Lidj Yasu (or Jeassu), heir to the throne, and upon the death of Menelek in 1913, Lidj Yasu succeeded. September 27, 1916, Lidj Yasu was deposed and was succeeded on the throne by his aunt, Ouizero-Zeoditu, a daughter of Menelek (born 1876). She was crowned at Addis Abeba February 11, 1917. In an edict issued at the time she exempted all taxpayers who were in arrears

and all criminals who were still at large. March 17, 1917, after an uprising, Raiswaldi Georgis, a cousin of the late Menelek, was crowned king of Wallou, Goudar, and Bekember. Meanwhile the deposed emperor, Lidj Yasu, was in the fortified town of Magdala with government troops. It was further reported that fighting had taken place at Wallou and also at Rousi and that Georgis was advancing to the former place and General Balchi, to the latter. According to press despatches of August 27, Lidj Yasu and his followers had escaped from Magdala and later there were rumors of a battle in which the government was victorious. According to some reports (September 1) Lidj Yasu was captured; according to others (September 2) he was killed.

**ACADEMY, FRENCH (ACADÉMIE FRANÇAISE).** A body of distinguished men of letters founded by Cardinal Richelieu in 1635. It is the oldest and the most celebrated of the five academies constituting the Institute of France. The other four are the Academy of Inscriptions and Belles-lettres, the Academy of Sciences, the Academy of Fine Arts, and the Academy of Moral and Political Science. The French Academy was reorganized in 1816; it is the final court of appeal in disputed literary questions, and its members are known as the Forty Immortals. The annual public session was held on December 20, 1917. During the year Joseph J. C. Joffre, Marshal of France, and John H. Cahill were elected members of the Academy; the latter in recognition of his munificence toward widows of French soldiers who had died in the war. The secretary of the Academy, who holds his position for life, is Etienne Lamy. The members in the order of their election are as follows: Othenin P. de Cléron, Comte d'Haussonville, Charles Louis de Saulces de Freycinet, Louis Marie Julien Viaud (Pierre Loti), Ernest Lavisse, Paul Bourget, Jacques Anatole Thibault (Anatole France), Gabriel Hanotaux, Henri Léon Emile Lavedan, Paul Deschanel, Edmond Rostand, Frédéric Masson, René Bazin, Etienne Lamy, Alexandre F. J. Ribot, Maurice Barrès, Maurice Donnay, Jean Richepin, Raymond Poincaré, Eugène Brieux, Jean Aicard, René Doumic, Marcel Prévost, Monseigneur Louis Marie Duchesne, Henri de Rénier, Denys Cochin, General Hubert Lyautey, Emile Boutroux, Alfred Capus, Pierre de la Gorce, Henri Bergson.

**ACADEMY OF ARTS AND LETTERS, AMERICAN.** A body of distinguished men, limited to fifty in number, chosen from among themselves by the 250 members of the National Institute of Arts and Letters. The National Institute was organized at a meeting of the American Social Science Association in 1898. The Academy was founded in 1904, with William Dean Howells as president, which position he still held in 1917. The Academy is to a large extent modeled on the French Academy, and, with the National Institute, it holds an annual meeting; but the plans of the Academy are held in abeyance until the close of the war. In 1917 the membership list was as follows: William Dean Howells, Henry Adams, Theodore Roosevelt, John Singer Sargent, Daniel Chester French, John Burroughs, James Ford Rhodes, Horatio William Parker, William Milligan Sloane, Robert Underwood Johnson, George Washington Cable,

Andrew Dickson White, Henry van Dyke, William Crary Brownell, Basil Lanneau Gildersleeve, Woodrow Wilson, Arthur Twining Hadley, Henry Cabot Lodge, Edwin Howland Blashfield, Thomas Hastings, Hamilton Wright Mabie, Brander Matthews, Thomas Nelson Page, Elihu Vedder, George Edward Woodberry, Kenyon Cox, George Whitefield Chadwick, Abbott Handerson Thayer, Henry Mills Alden, George de Forest Brush, William Rutherford Mead, Bliss Perry, Abbott Lawrence Lowell, Nicholas Murray Butler, Paul Wayland Bartlett, Owen Wister, Herbert Adams, Augustus Thomas, Timothy Cole, Cass Gilbert, William Roscoe Thayer, Robert Grant, Frederick MacMonnies, Julian Alden Weir, William Gillette, Paul Elmer More, George Lockhart Rives, Barrett Wendell, and Gare Melchers. The secretary is Robert Underwood Johnson.

**ACADEMY OF SCIENCES, NATIONAL.** A body of distinguished American scientists, incorporated in 1863, with the object "whenever called upon by any department of the government, to investigate, examine, experiment, and report upon any subject of science or art." At the end of 1916 there were, according to the latest statistics available, 147 members and forty foreign associates. The officers were as follows: President, William H. Welch; vice-president, Charles D. Walcott; foreign secretary, George E. Hale; home secretary, Arthur L. Day; treasurer, Whitman Cross. The autumn meeting in 1917 was held on November 20-21 at Philadelphia in the Engineering Building of the University of Pennsylvania. Among the topics discussed were: "The Wheat Problem of the United States," by Irwin F. Smith; "The Atmosphere and Terrestrial Radiation," by Charles G. Abbot; "The Modern Systematist," by L. H. Bailey; "The Chemical Mechanism of Regeneration," by Jacques Loeb, of the Rockefeller Institute; "A Duty of the International Association of Academies," by William M. Davis; and "The Work of the National Research Council," by George E. Hale.

**ACCIDENT INSURANCE.** See SOCIAL INSURANCE.

**ACCIDENTS.** See RAILWAY ACCIDENTS.

**ACIDOSIS.** See CHEMISTRY.

**ACTIVATED SLUDGE.** See SEWERAGE AND SEWAGE TREATMENT.

**ADAMSON LAW.** See ARBITRATION and CONCILIATION, INDUSTRIAL.

**ADEN.** A British possession in southwestern Arabia, forming a part of the Bombay Presidency of British India. It consists of a peninsula and a small strip of coast. Area, 75 square miles, or with the Island of Perim 80 square miles. Population in 1911, 46,165, as compared with 43,974 in 1901. A territory extending inland from Aden, about 9000 square miles in area, is under British protection; estimated population, about 100,000. The town of Aden is strongly fortified and constitutes an important coaling and transshipment station. Except the small quantities of exports and imports to and from Arabia, the trade is almost wholly transit. In 1915-16 imports of private merchandise by sea were valued at £3,500,039; by land, £107,621; imports of treasure, £268,663. Private exports by sea in that year, £3,044,131; by land, £46,303; exports of treasure, £393,442. The leading imports by sea are cot-

ton goods, grain, hides and skins, and tobacco. The exports by sea include these articles, together with coffee, gums, civet, and wax. The total value of the exports from Aden to the United States during the third quarter of 1917 amounted to only \$85,482. This amount was made up of civet valued at \$4367 and skins valued at \$81,115. During the corresponding quarter of the previous year the total exports from Aden to the United States were valued at \$541,895, and were made up of civet, with a value of \$3006; coffee, \$34,812; gums, \$1145; hides, \$3740; senna leaves, \$1614; and skins, \$497,578. The remarkable falling off in exports mainly was due to the lack of shipping space. One probable result of the shipping condition would be direct shipments to the United States from Red Sea ports which normally send their American shipments through Aden. Owing to the restrictions governing shipments on British steamers from Aden to foreign countries, with transshipment in England, a large share of Aden exports to America during 1917 went by Italian steamers on a through bill of lading with transshipment in Italy. American importers normally take a larger share of Aden exports than those of any other nationality, and the inability to make the usual shipments to the United States was having a depressing effect upon the local export business. Aden is subject to the government of Bombay and is administered by a resident, who is also commander of the troops in the garrison. Administratively attached to Aden, besides Perim, are Socotra and the Kuria Muria Islands.

**ADVANCEMENT OF SCIENCE, AMERICAN ASSOCIATION FOR THE.** The seventieth meeting of the American Association was held in Pittsburgh, Pa., on December 28, 1917, to January 3, 1918. Twenty-four affiliated societies met with the Association at the same time. At the permanent secretary's office the total registration was 692. Of these, 194 were from Pittsburgh and other parts of Pennsylvania. Several distinguished foreigners attended, and these, who were made honorary associates for the meeting, included Lieut. Georgia Abbeti, of the Italian Military Commission; Capt. De Guiche, of the French Military Commission; Dr. Shigetarō Kawasaki, Chief Geologist of Korea; and Lieut. G. P. Thompson, of the Royal Flying Corps of Great Britain. War topics dominated the meeting—the ways and means necessary to carry through the war on a basis of scientific efficiency to a victorious conclusion. The opening general session took place on the evening of Friday, December 28, in the lecture hall of the Carnegie Institution, and in the absence of Prof. Theodore W. Richards, the senior vice-president, Dr. George H. Perkins, of the University of Vermont, presided. An address of welcome on behalf of the Mayor of Pittsburgh was given by Mr. H. M. Irons, city attorney of Pittsburgh. After amendments to the constitution had been passed, including one making secretaries eligible for reelection, Dr. C. R. Van Hise, retiring president of the Association, gave a notable address on "Some Economic Aspects of the World War," after which a reception was held by members of the local committee and their wives.

Hon. John Barrett read a paper on "The War and the New Pan-America"; Howard E. Coffin, president of the Aircraft Board at Washington,

gave an address on "General Standardization"; Dr. Vernon L. Kellogg, now associated with Mr. Hoover's work at Washington and formerly of the Belgian Relief Commission, spoke on "The Biological Aspects of the War"; and Lieut. George Loewy, of the French Army, gave an address on "The Treatment of War Wounds by the Carrel Method."

Among other topics on which papers were read and discussions held in the various sections were: "Education in Chemical Engineering"; "Factors Concerned in an Increased Agricultural Production"; "Relationship of Physics to the War"; "War Problems in Botany"; "Contributions of Zoölogy to Human Welfare"; "Medical Problems of the War"; "The Organization of War Gardens"; "Insects and Camp Sanitation"; "How the Entomologist Can Assist in Increasing Food Production," and "Phytopathology in Relation to War Service." Among the acts of the Council of the Association were these: C. H. Fernald, R. H. Richards, Marshall Calkins, and T. J. W. Burgess were made life members emeritus under the terms of the Jane M. Smith Fund; the movement for the revision of the constitution of the Association was held in abeyance; and it was decided that until the next annual meeting all business of the Association be referred to the Committee on Policy with power to act.

It was decided to hold the next meeting of the Association in Boston, Mass., beginning on Friday, December 27, 1918, but the decision was subject to the power of the Committee on Policy to cancel the meeting or change the date. It was recommended that St. Louis be chosen as the place for the next meeting after that held in Boston. The following officers were elected: president, John M. Coulter, of the University of Chicago; vice-presidents, George D. Burkhoff, Gordon T. Hull, Alexander Smith, Ira N. Hollis, David White, William Patten, A. F. Blakeslee, John Barrett, Frederick S. Lee, S. A. Courtis, H. P. Armsby; general secretary, O. E. Jennings.

**ADVANCEMENT OF SCIENCE, BRITISH ASSOCIATION FOR THE.** On account of conditions due to the war, the meeting of the Association for 1917 was postponed.

**ADVENT CHRISTIANS.** See ADVENTISTS.

**ADVENTISTS.** The Seventh Day Adventists, the largest branch of this denomination, had on December 31, 1916, a total church membership of 141,488, a net gain over 1915 of 4609. The total number of churches on December 31, 1916, was 3987; ordained ministers, 991; licensed ministers, 687; Sabbath schools, 5390; Sabbath school membership, excluding teachers, 153,781. The value of the church property on December 31, 1916, was \$2,461,779. The number of Young People's Societies was 1342; their total membership, 25,836; mission fields, 113; number of languages in which publications were issued, 90; the total contributions for all lines of evangelistic work in 1916 were \$3,950,491, which is \$27.92 per capita. The total contributions for both evangelistic and institutional work for 1916 amounted to \$6,043,082, or \$42.71 for each member. At the close of 1916 there were 40 publishing houses and branches, with investments of \$2,167,177, and employing 740 persons in the production of denominational literature. There are seven educational institutions carrying college courses: Clinton Semi-

nary; Emmanuel Missionary College; Loma Linda, Pacific Union, Washington Missionary, and Walla Walla colleges. Other branches of Adventists are: Advent Christians, about 26,000 communicants, 550 churches, 528 ministers; the Church of God, about 600 communicants, 20 churches, 32 ministers; the Life and Advent Union, 509 communicants, 12 churches, and 12 ministers in 1914, the latest available statistics; and the Church of God in Jesus Christ, 2224 communicants, 68 churches, and 61 ministers in 1914.

**AËRONAUTICS.** The progress made in aeronautics during 1917, and in fact the great developments that had resulted during the three and a half years of the war, more than anything else demonstrated the future commercial value of aviation at the termination of hostilities. This was seen especially in the development of large machines for bombing with their powerful and reliable engines, which naturally indicated such commercial applications as the transport with speed and economy of express, mail, and passengers. Aside from such suggestions for the future there were important developments in 1917 of direct military importance. The speed, maneuvering ability, and armament of the fighting machines were steadily improved, so that for the scouts and the smaller fighting planes the rate of speed attained in some cases reached almost 150 miles an hour. Likewise the development of the armament of all types of aëroplanes made marked progress, so that by 1917 the aëroplane had to be reckoned not as an important aid for scouting and observing but as an offensive weapon of direct value, and one that promised greater use in the future. The machines of large capacity used for bombing were exemplified in the Gotha biplane used by the Germans in attacking England, the Handley-Page biplanes of the British which could carry a crew of four men with three guns and a ton and a half of explosive bombs, and the Caproni triplane of the Italians which carried three tons of bombs. See **MILITARY PROGRESS.**

A most significant event was the entrance of the United States into the great European war. In previous years the United States had contributed a large number of machines to the Allies, yet there had not been actually developed a policy commensurate to the part the United States was destined to play in the great war. Accordingly the work done in the United States in 1917 after the declaration of war, was necessarily preparatory, although large numbers of student aviators were sent abroad for training, and complete training was begun in the United States. It was realized that whatever was to be done in the way of preparation must be done on a scale entirely unprecedented, and accordingly the manufacturing resources of the country were mobilized as regards their facilities for turning out aëroplanes. Naturally in a record of the activity of the year, much is unavailable for publication for military reasons, and more remains that involved merely wholesale organization and production. It was decided however by the responsible officials of the United States and their foreign allies that the greatest assistance could be rendered by turning out at once a large number of standard machines rather than by carrying on experiments to develop a more

perfect or more efficient construction that might involve radical departures from existing practice. In fulfillment of such a policy it was stated at the end of the year that a fleet of 22,000 aëroplanes was under construction in the United States, and that a force of 10,000 aviators was being trained, while the total personnel of the flying corps under the new organization was to amount to 100,000.

In addition to the work of organizing factories and stations for aëroplanes in the United States, a force of mechanics was enlisted to proceed to France and construct and establish repair stations behind the lines for the American aviation service. Arrangements were made for training these men in England during the winter of 1917-18, and they were to be sent abroad with the various units as required.

The aeronautical appropriation bill, signed by President Wilson on July 24, involved the sum of \$640,000,000, and this measure at once gave an impetus to the manufacture of aëroplanes and the training of aviators. The leading aëroplane manufacturers of the United States agreed to pool their patent interests for the good of the nation, and a new organization known as the Manufacturers' Aircraft Association, Inc., was formed. By agreement, the various patents owned by individual members were to be taken over and licensed so that their use might be made universal to all in the industry. The control of the new association was placed in the hands of three voting trustees, consisting of Judge W. Benton Crisp, patent attorney, Professor Joseph S. Ames of Johns Hopkins University, and Albert H. Flint, a well-known aëroplane manufacturer. Of these three, one represented the Manufacturers' Aircraft Association, Inc., one the Curtiss-Wrights' interest, and the third was a neutral elected by the other two.

To take the place of the Aircraft Production Board, a new Aircraft Board was established, and on November 10, it was announced that Howard E. Coffin, chairman of the former board, had been appointed chairman of the new board, of which R. F. Howe of the International Harvester Company was appointed as civilian member, Maj. Gen. George O. Squier, Chief Signal Officer, Col. E. A. Deeds and Col. R. E. Montgomery were the army members, and Rear Admiral Taylor, Capt. M. E. Irwin, and Lieut. Com. A. K. Atkins were the Navy members.

During the year the International Aircraft Standard Board of the Advisory Commission of the Council of National Defense formulated specifications for aircraft construction and materials. These specifications covered general inspection and testing instructions, raw materials, fabricated materials, fabricated parts, etc. The various series named above were further subdivided and for each separate material specifications were prepared in detail. It was anticipated that these or other specifications would figure in some form of international specifications which international committees of the various nations were contemplating.

**COMMERCIAL AËRIAL NAVIGATION.** In America as in Europe increasing interest was manifested during the year in civil aërial transport, and in plans to utilize after the war the large number of military aëroplanes and aviators. The National Advisory Committee for Aëronautics accordingly appointed a committee of civil aërial

transport, consisting of chairman, Dr. W. F. Durand; Dr. S. W. Stratton, director of the United States Bureau of Standards; Professor Charles F. Marvin, chief of the United States Weather Bureau; Lieut. Col. V. E. Clark, Signal Corps; and Lieut. Com. J. H. Towers, U. S. N.

Seven definite routes for airways across America and up and down the Atlantic and Pacific coasts were proposed during the year which were to be discussed at an aeronautical congress to be held in New York in February, 1918. These airways were laid out with due regard to suitable stopping places and for the transportation of mails.

In this connection much attention was being paid in Europe to the development of various air routes and their regulations. Colonel Lord Montagu of Beaulieu discussed this subject in a lecture on June 21, 1917, and stated that once the war was over, there must be national and international laws for the regulation of flying. The discussion included the definition of overseas and over-continent routes and plans to utilize to the greatest advantage the winds of the world. Lord Montagu proposed that above 10,000 feet, the air should be free to all; above 8000 feet, it should be restricted to official planes; between 4000 and 6000 feet it should be available for general air traffic and commercial planes; between 2000 and 4000 feet, would be a general commercial level where a maximum speed of 80 miles per hour would be maintained for planes fitted with silencers. Up to 2000 feet the air would be free for private traffic and restricted from aerial nuisances.

In the British House of Commons, a special aerial transport committee was announced on May 23, to study the possibilities of the application of aircraft to commercial purposes. This committee included representatives of the British Air Board, the Royal Aero Club, the Government of India, the Royal Flying Corps, the Royal Naval Air Service, the Colonial Office, the Foreign Office, the Post Office, the Treasury and Board of Customs, and the Meteorological Office. The purpose of this committee as stated in the House of Commons by its deputy chairman was as follows:

"To consider and report to the Air Board with regard to: (1) The steps which should be taken with a view to the development and regulation, after the war, of aviation for civil and commercial purposes, from a domestic and Imperial and an international standpoint. (2) The extent to which it will be possible to utilize for the above purposes the trained personnel and the aircraft that the conclusion of peace may leave over and above the requirements of the naval and military air services of the United Kingdom and the overseas dominions."

In France also the question of civil aeronautics was discussed during the year, and on January 6, 1917, a Commission of Civil Aeronautics was created by ministerial decree to study the possibilities of using aircraft for transportation of mail and other commercial purposes. This commission included representatives of the Cabinet of Deputies, the Bureau of Post Offices and Telegraphs, the Aero-Club de France, the Chambre Syndicale des Industries Aéronautiques, and the Aerial League of France.

**THE BRITISH AIR MINISTRY.** The various attempts made to secure a British Air Minister as a member of the Cabinet, resulted in the appointment of Baron Rothermere, chief proprietor of the *Daily Record and Mail*, of Glas-

gow, and the Leeds *Mercury* as Air Minister. This post previously had been refused by Lord Northcliffe on account of his dissatisfaction with the policies of the Prime Minister, Lloyd George.

**MILITARY AÉRONAUTICS.** The record of military aeronautics during 1917 was one of increasing activity in all departments. Numerous attacks were made on the British Isles by German aeroplanes and Zeppelins but generally without conspicuous success, while in response a general attempt at reprisal raids was undertaken by British and French on the German fortifications and cities. An interesting development of the aerial fighting was the attack in force on various aerodromes and supply stations according to preconceived plans and careful arrangements. This naturally led to corresponding measures of defense, so that aerial battles were being fought as independent actions in quite as definite a manner as in the case of the artillery on the surface of the ground. Dock and harbor works, such as those at Ostend, Zeebrugge, and Bruges, munitions dumps, and in December the city of Mannheim itself were the objects of attack, and a measure of success was attained. While exact details were not available at the end of the year for either the specific actions or the results in the aggregate it was certain that the Allies carried on bombing to a greater extent and more profitably than ever previously during the war.

Perhaps the most significant and spectacular action so far in the war was the attempt made on Friday, October 19, 1917, by a score of Zeppelin airships to bomb England. This event was compared at the time to the defeat of the Spanish Armada in 1588 by Drake's fleet. The German Zeppelins which officially were said to have numbered at least ten apparently were lost in the fog, and were scattered over France, by a strong wind. Four were brought down in France and two were sunk in the waters of the Mediterranean. It was stated in Parliament by Sir George Care, Home Secretary, that five of the Zeppelins reaching England failed to attain their purpose. One drifted over London dropping three bombs. The British aeroplanes went up, but were unable to bring the raiders into action, due largely to atmospheric conditions, and the total number of casualties amounted to 34 killed and 56 injured.

Of the airships taking part in this raid the L-45 was compelled to land in the village of Laragne and the captain and crew were captured, while the L-49 which came down near Bourbonne-les-Bains was captured intact by the French. See **MILITARY PROGRESS; NAVAL PROGRESS.**

A summary of the extent to which aeronautics was employed by the British Army was shown in a statement on October 24 by Major-General Frederick B. Maurice, chief director of military operations, in which he said:

"During September our bombing machines made 226 raids, dropping on the Germans 7886 bombs, representing 135 tons of explosives. In the same period the Germans dropped almost exactly 1000 bombs on the British. Now bombing is only a part of our air operations. By far the most important work is the direction of the artillery."

"During September we made 7962 'shoots' at enemy batteries under aerial observations and silenced them in 1813 instances. During the same period the Germans succeeded in ranging on only 748 of our guns."

"During September we engaged and brought down 274 enemy planes, and this figure errs on the side

of conservatism, for our headquarters never allows credit for a victory unless the fall of an enemy is corroborated from either an observer on the ground or another airman in the vicinity.

"It is no discredit to the British airmen that they did not bring down a single Zeppelin, while the French airmen brought down five, in the course of the Zeppelin visit a few days ago. No French airman would think of comparing the task which they had of attacking the Zeppelins in daylight, when the airships were at the end of a long flight and partially crippled, with that of the British in finding and attacking them in the night.

"Incidentally it may be said the British air service since the beginning of the war has brought down sixteen Zeppelins under conditions far more difficult than those under which the French were so successful the other day."

**NOTABLE AÉROPLANES OF 1917.** One of the most efficient war planes of 1917 was the British Handley-Page machine which has figured conspicuously in official reports where bombing operations against German bases have been involved. During 1917 these machines were being manufactured extensively and towards the end of the year were going into service almost daily. The Handley-Page machine had two 12-cylinder Rolls-Royce motors of 280 horsepower each, while the top wing was 98 feet wide, the length of the machine 65 feet and its height 20 feet. It had mountings for three Lewis guns. This machine held the world's record in 1917 for large number of passengers carried, having borne 21 passengers in one flight to a height of 7180 feet.

Among the German aéroplanes, the Gotha biplane was used with considerable effect and was said to exhibit a marked resemblance in certain particulars to one of the best known large aéroplanes of the British service. These Gotha planes were about 40 feet in length and of the "pusher" type. The wings set at a very slight dihedral angle were equal in span (about 77 feet) with projecting ailerons. There were two guns where operators both front and rear could fire downwards and upwards, as well as on their own level, or right and left. The bottom of the fuselage was open for a great portion of its length, enabling the gunner to fire at a pursuer through the tunnel so formed.

In the United States, the Curtiss works developed the triplane which had a wing span of 146 feet and was provided with a boat hull. It was thought by many aéronautical engineers that if the heavy hull was supplanted by wheels it would be able to carry several tons of explosive over distances as great as a thousand miles. Another American machine developed during the year was the Galandet biplane, which was available either for bomb dropping or torpedo launching.

**AÉROPLANE ENGINES.** The development of the power plant of the modern aéroplane typified mechanical progress generally in the elimination of various extreme and special types and the approximation to well-defined standards. By 1917 two main types of motor had survived, the rotating-cylinder engine such as the Gnome, LeRhône, and Clerget patterns, and various forms of vertical-cylinder or V-cylinder motors. The German practice during 1917 was to use a vertical-cylinder engine of the Benz or the Mercedes type and seldom more than six cylinders were employed in a single unit, but, with the Allies the most usual type had the eight or twelve cylinder V-form. Single motors were being built up to 300 or 400 horsepower and

some of the larger machines had four power plants installed with an aggregate output of from 1200 to 1500 horsepower. There was a general tendency manifested in 1917 to give greater power to all of the aéroplanes and where once an 80-horsepower engine was provided for a small high-speed scouting or fighting plane, this was being increased to 150 or 200 horsepower. As illustrating the high quality of design and construction it might be said that the increase in power was not attained at the expense of weight as some of the air-cooled revolving-cylinder motors did not weigh more than three pounds per actual horsepower, while powerful watercooled engines were built which did not weigh more than four pounds per horsepower. The American Liberty Motor was said to have surpassed European achievements and weighed only two pounds per horsepower.

Another compelling reason for increasing the horsepower, was the increased altitude and higher speeds which many of the scouting planes were required to attain. In some cases, an altitude of over 20,000 feet and a speed of from 125 to 140 miles per hour were required, and accordingly it was necessary to provide for an extraordinary condition developed at the higher altitudes. Inasmuch as the atmospheric pressure decreases from about 14.7 pounds per square inch to about 10 pounds per square inch at an altitude of 10,000 feet, an ordinary engine would develop at the higher altitude only about  $\frac{2}{3}$  of the power produced at sea level. Furthermore, as the altitude increases, the temperature of the air diminishes, and this too had its effect on the operation of the engine. In many engines designed for flight at high altitudes, the normal operation was arranged for the higher levels, and the full power was not utilized at low altitudes.

Late in the year, there was assembled in Great Britain an exhibition of captured German aéroplanes and engines for the benefit of designers and manufacturers of aéro-engines. It was here made plain that German practice had settled down to a straight-forward racing car engine design in which reliability, durability, and ease of manufacture with ordinary labor and shop equipment, were the chief essentials rather than extraordinary lightness for the power developed. A nine-cylinder rotary air-cooled 100 horsepower Oberursel engine which had been used on a Fokker fighting monoplane marked the departure from the more usual vertical engines and resembled the class of the Gnome rotary engines.

The various styles shown were typical of German equipment. There was the Mercedes 160-horsepower and 280-horsepower; Benz, 160-horsepower and 260-horsepower; and Argus, 120-horsepower and 200-horsepower. In some cases the German engines were found equipped with English carbureters and English magnetoes, for the Germans were stripping captured British machines and fitting their auxiliary equipment to their own motors.

**THE LIBERTY MOTOR.** In the United States a significant event of the year was the development of the so-called Liberty Motor, or a standard design for the wholesale production of aircraft which was being commenced in the United States. This motor represented the joint efforts of the Aircraft Production Board, of the Signal Corps, Messrs. Jesse G. Vincent and

Hall, and many engineers and other American and European experts who united to produce a new standard power plant that would be available for the aerial forces of the United States as well as of the Allies.

The motor designed had eight cylinders and was expected to develop over 250 horsepower, while with four additional cylinders, it was expected that 400 horsepower at 1625 revolutions per minute would be developed. In the development of this engine all of the patents, ideas, and resources of the leading aeronautical engineers and motor manufacturers of the United States were made available, and on July 3, 28 days after the drawings were started, an experimental motor engine was set up. On July 4 a test of the motor was made and deliveries began soon afterward. On September 14, a machine fitted with a Liberty Motor piloted by H. W. Blakley made a flight of three-quarters of an hour with Colonel Theodore Roosevelt as a passenger.

The new engine represented the best approved and accepted practice not only of the United States, but of England, France, and Italy, the plans being conservative in that no novelties were introduced or ideas that had not been tested in actual practice. It had a weight of about two pounds per horsepower developed. Thirty days after the first engine was assembled and underwent preliminary test, the government formally accepted the design, the experts considering it the best all-around aircraft engine produced in any country, and one that had every element of success. In addition to experiments in the vacuum chamber of the U. S. Bureau of Standards, a test conducted at Pike's Peak showed the new aviation engine could perform satisfactorily at the high altitude, while in a flight test an airplane thus equipped broke the American altitude record. Owing to the policy of standardization adopted, the construction, repairs, and maintenance were greatly facilitated and spare parts were always to be available.

The engine was designed so that it could be constructed in four models, ranging from four to twelve cylinders, with all of the parts interchangeable, so that a new engine could be assembled from the parts of a wrecked machine. The standardization, however, was not carried to such an extent that no changes or improvements could be made during the war.

**BRITISH MOTORS.** During the year the Sunbeam Motor Car Company brought out aircraft engines of high output which were distinguished by the fact that they had no fly-wheel and the crank case and nose piece were cast in one so as to gain increased rigidity and accessibility. The 6-cylinder narrow type engine arranged with vertical cylinders had an output of 170 B. H. P.; the 12-cylinder engine of the V-type had an output of 350 B. H. P.; while in a 475 B. H. P., a broad arrow-type engine, there were three rows each with 6 cylinders set on a common crank case. The engines were water cooled and were notable for their low consumption of gasoline and oil. These high capacity motors were typical of the tendency towards using more powerful machines on the military aircraft during 1917.

**AÉROPLANE ARMAMENT.** The first airplanes carried simply rifles or automatic pistols, and from this it was a simple step to install quick-

firing guns but with somewhat crude mountings. Early machines thus armed had considerable dead angle in which the guns could not be used and accordingly they were susceptible to surprise attacks. In the early machines of the French, the dead angle was in the rear and sides, while in the German machines, the dead angle was in the front. At first there was little precision in firing due to various causes, but this soon was removed, and both in France and in German and Austrian services standard arrangements soon were adopted. There were fixed quick-firing guns for firing in front, above or through the propellers of a single seated machine; and later a second gun mounted on a turret was supplied in two-seater machines for firing astern. A quick-firing gun for front firing was mounted on a turret, a similar gun was arranged for firing astern, while a gun was provided for firing below the fuselage by the pivot mounting in the case of a three-seater machine.

Garros, the French aviator, in his machine was the first to fire a fixed quick-firing gun through the propeller, losing of course a certain percentage of his balls which struck the sleeves of the propeller blades, and this plan was adopted by the Germans, except that they sought to synchronize the operation of the quick-firing gun with the working of the engine.

In the large Gotha three-seater aeroplanes, where two propellers and two engines are used, and this is true for other German powerful machines also, the armament consisted of a quick-firing gun on a turret forward and a small one aft, with a third gun arranged for firing downward below the fuselage. The Germans employed during 1917, a series of bullets classed as ordinary, perforating, incendiary, and explosive, whose functions are sufficiently indicated by their names. The operation of the various guns in the German service was well-known to the aviators of the Allies during 1917, and a description of the same was published during the year in *La Nature*. In the case of the Allies, similar arrangements were used or were in course of development, and the use of quick-firing and rapidly-firing guns was being developed not only for aerial battles but also for attacking troops on the surface of the earth.

**DIRIGIBLE BALLOON.** While the experience of 1917 indicated that the Zeppelin airship was of diminishing importance, there was no reason for assuming that the dirigible had been discarded for many forms of service. In connection with the submarine patrol work, the Allies were using this form of airship to an increasing degree and the Italians had developed the Forlanini type to a degree where it could achieve considerable altitude and was stable on long distance flights. In the United States, in May, 1917, the first of sixteen non-rigid dirigible balloons ordered by the Navy Department was completed and tested, making a trial trip from Chicago to Akron, Ohio, more than 400 miles. This American airship was said to be very much after the pattern of the British "blimps." It was also reported that the remainder were completed and put into service along the Atlantic coast during the year, to assist the submarine chasers and other coast defenses.

The German Zeppelin, L-49, which came down in France after the October raid on England,

was an airship 650 feet in length and carried four cars, two of which were at the sides, and the other two were placed on the main axis of the aeroplane. In the forward car were the quarters of the captain. The propellers were driven directly from six engines of the Maybach type, each developing 240 horsepower, enabling a speed of 70 miles to be obtained. The hydrogen gas was distributed in 20 small balloons. In the latter part of the year, it was reported from Switzerland that the latest Zeppelins were 760 feet in length and 78 feet in diameter, and were supplied with eight engines developing an aggregate of 2000 horsepower. They were able to remain in the air 50 hours.

In a statement issued towards the end of the year in behalf of the Allies it was explained that some 43 Zeppelin airships could be accounted for:

Destroyed in Germany, 5; destroyed in neutral countries near the front, 5; destroyed in England by the British or on their way home from raids in England, 15; out of use, 5; used at training schools, 4; in use especially in the North Sea, 9; total, 43.

**CONTROL BY TORPEDO BOATS FROM AN AEROPLANE.** The aeroplanes were used in connection with electrically controlled sea-raiders employed by the Germans off the coast of Belgium. These electrically controlled boats carried a charge of high explosives from three hundred to five hundred tons in weight and were driven by twin-screw gasoline motors. On a drum was wound some thirty to fifty miles of insulated single core cable through which the boat could be controlled electrically. After the engine was started, the crew left the vessel and then a seaplane, protected by a strong fighting patrol, accompanied the vessel at a distance, and signalled to the shore operator the direction to be steered.

**NOTABLE FLIGHTS.** A new world's long distance flying record was made on August 29 by Capt. Giulio Laureami of Italy, who flew without stopping from Turin to Naples and return, a distance of about 920 miles. A new S. I. A. machine with a Fiat motor was employed. This record for non-stop flight supplants that previously held by Lieut. Antoine Marchal, a French aviator, who in June, 1916, flew about 807 miles from Nancy to Chelm, Russian Poland, in the course of which he dropped bombs on Berlin. Lieut. Marchal was captured by the Austrians at Chelm, and was interned at Salzerbach. Another notable non-stop flight from Italy to England was made on September 23, 1917, by Capt. Laureami, who accomplished the 656 mile journey in 7 hours, 22 minutes, 30 seconds. He flew in an Aila machine carrying a mechanic as passenger and two machine guns.

The British Admiralty announced on November 22 that an air attack in the vicinity of Constantinople had been successfully made by a large bombing aeroplane which enjoyed the unique distinction of having flown from England to Constantinople, a distance of almost 2000 miles. This was stated at the time as a world's record of a cross-country journey in view of the weight carried, and also was remarkable on account of the strong winds and heavy rain storms experienced, with a stretch of 200 miles over a mountainous country where a landing would have been impossible. The

attack on Constantinople was made from a British base in the Mediterranean, which was the last of a series of eight stops, among which were Lyons and Rome. The total time in the air for the machine was 31 hours.

A unique flight was made on November 1, when Lieut. Hanson McCann, U. S. N., left the Norfolk Navy Yard in Virginia at 5.30 o'clock in the afternoon, and with one stop to obtain a fresh supply of fuel flew to Duquoin, Ill., a distance of 1023 miles in order to enable a seaman who was carried as passenger to reach the bedside of his dying mother. At Norfolk, Va., Captain Razanti, one of the seven Italian aviators to spend the autumn in America, took 21 passengers 17,000 feet into the air. On this trip he was 58 minutes in flight and during that time flew 82 miles. This flight broke the world's record for altitude for machines carrying more than 5 passengers.

**ITALIAN AVIATORS IN AMERICA.** A notable flight of the year was made on November 13, when Captain Silvio Resnati of the Royal Flying Corps, a member of the Italian aerial delegation, flew from Mineola, L. I., to Langley Field, Norfolk, Va., in a huge Caproni machine. This flight was 322 miles in extent and the Caproni biplane carried 10 passengers, including, in addition to the pilot, Captain Resnati: Capt. H. H. Salmon, Jr., U. S. A., assistant pilot; Capt. Davis and Willetts; Lieuts. Simonin, Haggarty, and Watson; Privates Blackman and Neiardt of the U. S. A.; and one mechanic. The Caproni biplane, which arrived in the United States on October 22, attracted much interest among United States army aviators and aircraft engineers, on account of its size and capacity. It made a number of notable flights in which various officials, officers, and experts were carried as passengers.

Another Italian aeroplane, the Pomilio biplane, made a number of record flights after its arrival in the United States. The Pomilio biplane, piloted by Attilio Valdioli, with Capt. L. B. Lent, U. S. A., as passenger, made the trip from Langley Field, Norfolk, Va., to Mineola, L. I., a distance of 322 miles, in 2 hours and 50 minutes. At the same time the Caproni made another record flight. With eight passengers, it flew from the Langley Field to Mineola, while the S. I. A. machine, piloted by Lieut. Ballerini with a passenger, made the trip in 3 hours and 25 minutes.

**DEATH OF CAPTAIN GUYNEMER.** One of the casualties of the great war was the death of Capt. George Guynemer, the most famous French aviator, which occurred on September 11, in the course of a reconnaissance flight over Flanders. Capt. Guynemer was reported to have engaged five machines of the Albatross type D-3, when he was overwhelmed by the large number of enemy machines soaring at a great height falling upon him. There were 40 enemy machines in the air at one time, including Count Von Richthofen, the celebrated German aviator. An attempt was made by some Belgian machines to come to the aid of Capt. Guynemer, but they were too late. A comrade reported that he saw Guynemer's machine drop gently towards the earth, but not on fire. In the official French announcement, the 50 aeroplane victories of Capt. Guynemer were commented on, and it was unofficially announced in the course of his flying career that he had ac-

counted for 52 enemy machines. Guynemer was one who operated his aeroplane alone, serving as both pilot and gunner.

**DISTINGUISHED AMERICAN AVIATORS.** In the distribution of French military honors for aircraft distinction, the Americans decorated were Lieut. Raoul Lufbery, seventh on the list of French aces, and Sergts. Robert Rockwell, Robert Soulbain, and David McKay Peterson. The records of these men were duly published in official citations.

**ADVERTISING THE LIBERTY LOAN.** In connection with the campaign for the Liberty Loan American and foreign aviators in this country played an important part and aroused considerable interest showering paper bonds and bond posters over many of the main American cities.

**THEORETICAL CONSIDERATIONS.** Among the theoretical discussions connected with the development of aeroplanes was the question how far the size and weight of flying machines could be carried. It was believed that in view of the condition of the art of design and construction of both planes and motors, and reasoning along analogous lines in the experience of the motor car industry, there would be no very extraordinary increase over the dimensions of the largest machines seen in 1917. At a meeting of the Aeronautical Society of Great Britain, Lieutenant A. R. Law presented a paper with a theoretical curve representing the attempt to fix the limits of capacity and power on the basis of present scientific knowledge. While this curve was based on data which he had collected before the war, yet it was interesting to note that there had been no better performance than the ideals therein indicated. Lieut. Law had assumed an ideal machine embodying every element with a co-efficient of performance attained with any one of these elements, and his data were obtained in large part from the army trials held a year or two prior to the war. No machine constructed by 1917 had exceeded in efficiency the theoretical composite thus evolved, and the curve indicated the various useful ranges of altitude which could be attained with various machines.

Thus a machine that could function satisfactorily at sea-level with a total weight of  $12\frac{1}{2}$  tons would have to be reduced considerably in weight to attain a height of 10,000 feet, while for a height of 25,000 feet the total and useful weight would be correspondingly diminished. Expressed mathematically the limit of weight varies nearly as the cube of the density of the air (which of course is reduced with increase in altitude), and the heights attainable could be plotted as ordinates against the ratio  $\frac{\rho_0}{\rho}$  as abscissae where  $\rho_0$  is the density of the air at sea-level and  $\rho$  is the density at any other level.

**MEASURING AIRCRAFT PERFORMANCES.** In Great Britain, the testing squadron of the Royal Flying Corps developed methods for the accurate testing of aeroplanes which by 1917 had become standardized and remarkably efficient both on a theoretical and practical basis. The general principles of the scientific testing were first laid down at the Royal Aircraft Factory, and with the increase of construction became standardized and developed in coöperation with the researches of various physicists and

meteorologists. A paper on this subject was presented by Captain H. T. Tizard, R. F. C., before the Aeronautical Society of Great Britain during the year, and was reprinted in the various aeronautical papers, as well as comprehensively abstracted in *Engineering* for August 24, 1917.

The methods of testing employed dealt with speed, rate of climb, stability, ease of operation, and other phenomena, mechanical efficiency and technical standards being considered as well as military availability.

**U. S. NATIONAL INSIGNIA FOR AIRCRAFT.** The War and Navy Department decided during the year on an insignia for the United States aircraft. It consists of a five-pointed white star inside of a blue circumscribed field, with the centre of the star red. One of each of these insignia was to be placed on the upper surface of each upper wing and also one of each on the lower surface of each lower wing. It was further provided that the rudder was to be painted in three bands of red, white, and blue, the blue band being nearest the rudder post, the white band in the centre, and the red band at the tail of the rudder. The national aircraft insignia was also to be placed on the gas bag of dirigible balloons, and the rudders were similarly to be marked. See **AVIATION FIELDS.**

**AÉROPLANE.** See **AÉRONAUTICS.**

**AFGHANISTAN.** A monarchy of central Asia lying between Persia on the west and tribal areas within the jurisdiction of the Government of India on the east. To the north are Russian territory and Bokhara; to the south, Baluchistan (British). Capital, Kabul. An estimate of area is 225,000 square miles; another estimate is 250,000 square miles. The population comprises various tribes, the most important of which include the Durrani, the Ghilzai, the Tajik, the Hazara, the Aimak, and the Uzbek. An estimate of their aggregate number is 5,000,000; another estimate, 6,000,000. Kabul is said to have about 180,000 inhabitants; Kandahar, 40,000 (some estimates are higher, one being 80,000); Herat, 20,000. The people, as well as the ruler, or ameer, are Sunnite Mohammedans, and justice is administered on the basis of the Koran. The principal occupations are grazing and agriculture. Mining has made little progress; manufactures include silks, felts, carpets, sheepskin coats, and articles of camels' hair and goats' hair. The chief exports are timber, fruit, cereals, pulse, ghi, wool, hides, cattle, spices, asafoetida and other drugs, and the manufactures mentioned above. The leading imports are cotton goods, tobacco, dyeing materials, sugar, and tea. The foreign trade, which is not reported by the government, is carried on chiefly with India and Bokhara. According to Indian returns, exports of merchandise to Afghanistan in 1914-15 were valued at £909,000, and imports of merchandise from Afghanistan at £806,000; in 1915-16, £1,021,000 and £1,116,000. The value of imports from Bokhara to Afghanistan is estimated at about 4,000,000 rubles, and that of exports to Bokhara about the same. Taxes are levied on production in amounts varying from one-tenth to one-third and their collection is often attended with oppression and extortion. The government is loosely organized. The power of the ameer, an hereditary prince, varies with his own character, ability, and fortune. His

army, including local levies, numbers upwards of 50,000 men, of whom about 16,000 are cavalry. The ameer's annual revenue probably exceeds 13,000,000 rupees; from the Government of India he receives an annual subsidy of 1,800,000 rupees. The Afghan government has by treaty no foreign relations except with the Government of India. The ameer in 1917 was Habib Ullah Khan, who was born July 3, 1872, and succeeded his father, Abd-ur-Rahman Khan, October 3, 1901.

**AFRICA.** After Asia the largest continent of the globe. Almost all of Africa's extent consists of colonial possessions of Great Britain, France, Portugal, Belgium, Germany, Italy, and Spain. Abyssinia and Liberia are independent, while Morocco is under Spanish and, especially, French protection. See the articles on the various African countries; also ANTHROPOLOGY.

**AFRICAN METHODIST EPISCOPAL CHURCH.** See METHODISTS, COLORED.

**AGELARINE.** See HORTICULTURE.

**AGRICULTURAL BANKS.** See AGRICULTURAL CREDIT.

**AGRICULTURAL CREDIT.** Among the most important constructive acts of the Wilson administration was the law establishing a system of Farm Loan Banks approved by the President in July, 1916. This law divided the country into twelve Federal Land Bank Districts with one land bank for each district. These banks are situated respectively at Springfield, Mass.; Baltimore, Md.; Columbia, S. C.; Louisville, Ky.; New Orleans, La.; St. Louis, Mo.; St. Paul, Minn.; Omaha, Nebr.; Wichita, Kan.; Houston, Tex.; Berkeley, Cal.; and Spokane, Wash.

The entire system is supervised by the Federal Farm Loan Board of five members with the Secretary of the Treasury as ex-officio chairman. Each of these banks started with 150,000 shares of \$5 each. Any stock not taken by individuals or firms was taken by the United States or State governments. The banks purchase first mortgages which do not exceed in amount 50 per cent of the appraised value of the land plus 20 per cent of the insurable value of the permanent improvements by which they are secured. They may not bear more than 6 per cent interest. These mortgages are issued on an amortization or partial-payment plan which provides that the semi-annual payments shall cover not only interest but a portion of the principal, so that the entire loan is extinguished by uniform payment over a definite period of years. They may range in value from \$100 to \$10,000. To secure funds the banks issue farm loan bonds in amounts of \$25, \$100, \$500, and \$1000 bearing not over 5 per cent and free from all forms of Federal, State, or local taxation. Thus the bonds secure additional funds which are used in purchasing additional mortgages, the interest from which pays the interest on the bonds as well as the administrative expenses. Loans are made only through farm loan associations composed of ten or more farmers desiring loans aggregating at least \$20,000; or in the absence of such associations, through special agents. The associations must subscribe 5 per cent of their loan toward the capital stock of the land bank of their district, such subscriptions being used to retire the original stock. Thus the banks will in the course of time become distinctly coöperative

institutions controlled by associations of the farmers who profit by the bank's credit facilities.

Applications from farm loan associations up to August 1, aggregated \$100,000,000, though the loans actually completed at that time amounted to only \$3,940,400. Thereafter loans were made at an accelerating rate. The slowness attending the inauguration of the system was due to the lack of experienced men and a great variety of technical difficulties connected with farm titles. The Farm Loan Board advocated a uniform system of title registration. In July it was announced by this board that arrangements had been made with the banking houses of Alexander Brown and Sons of Baltimore, Brown Brothers and Company of Philadelphia, Harris, Forbes and Company of New York, and Lee, Higginson and Company of Boston, as a syndicate with branches and agents in every land bank district to market at least \$30,000,000 of farm loan bonds. These bonds bearing 4½ per cent interest found a ready market at 101½ plus accrued interest. It was estimated that by the end of the first year at least \$100,000,000 of these bonds would have been issued. Those issued in 1917 run for 20 years and are redeemable at par plus interest on any interest date after five years. They are in all denominations permitted from \$25 to \$1000; they are coupon bonds exchangeable for registered bonds which are in turn convertible into coupon bonds again. Interest is payable semi-annually, May 1 and November 1, at any land bank, but bonds are redeemable only at the bank of issue. Mortgages on which these bonds were based bore 5 per cent interest and were to be amortized over a period of 36 years by semi-annual payments equal to 6 per cent of the original principal. More than three-fourths of the States were represented in loans approved by July 1, while the largest loans had been made in Texas, Oklahoma, California, Kansas, Colorado, Washington, New Mexico, Montana and South Carolina. At least 2000 incorporated farm loan associations were formed in 1917.

The demand for the farm loan bonds exceeded the supply. This was shown by the sale in this country of large amounts of the holdings of British and Scotch mortgage investment companies. The situation was due in part to the prosperity of American farmers who were paying off mortgages and demanding a smaller amount of new loans at the time when investors were most eager to extend loans, and in part to the fact that the interest rates demanded in some sections by the farm loan banks were deemed high. This latter situation raised the question whether, apart from the urgent necessities of war time, Federal credit aids would prove more efficient than the farm loan departments of banks, trust companies and farm loan companies. It was observed that enterprising bankers in various communities had adopted the policy of getting into close personal touch with farmers, and by assisting in the purchase of feed, fertilizer, blooded stock and implements had developed a considerable business in the way of personal and commercial loans.

While the farmers had not shown the eagerness for the credit facilities extended by the land banks which many had anticipated, it was pointed out that in well developed farm sections loans could already be secured for 5½ to 6 per

cent and that the slight saving in interest rate would be largely offset by the difficulties of forming loan associations. On the other hand the system had brought the farmers immense advantages by way of more liberal treatment by private agencies. It was pointed out by critics that the act made no provision for financing the tenant, the landless man, or the farmers temporarily insolvent. Moreover the business of the land banks was distinctly that of furnishing farmers long-time credit for permanent improvements and consequently the personal and seasonal credits demanded by progressive farmers would still require the service of commercial banks. In discussing the effect of the land banks on savings banks, Mr. L. G. Robinson, head of the Springfield (Mass.) Federal Land Bank, showed that the plan of financing farmers by means of very long-time loans with the amortization feature prevented savings banks from entering this field in competition. The farm loan bonds, however, offered an attractive investment for savings bank funds. More than twenty States in 1917 made these bonds legal investments for savings bank, public, and trust funds.

That these banks mark a new era in American farming and will assist in raising it to the plane of trade and manufacturing is shown by the vast amount of mortgage business which these banks will ultimately control. Their loans are expected to displace \$4,000,000,000 of existing farm mortgages and to reduce the interest rate from the average 7.4 per cent to 5 per cent, thus effecting an annual interest-saving of nearly \$100,000,000. It has been pointed out that the total agricultural credits of the country are about \$5,500,000,000 based on land valued at \$40,000,000,000 and annual crops of at least \$10,000,000,000. This credit has been extended by over 200 insurance companies, by over 18,000 banks, and by numerous private investors, estates, and institutions.

CANADA. Coincident with the inauguration of Federal agricultural credit in the United States the Province of British Columbia in May, 1916, authorized the formation of an Agricultural Credit Board. This had at its disposal \$1,000,000 provided by the government at an original cost of 5½ per cent, to be loaned to farmers and secured by farm mortgages. After several hundred thousand dollars had been loaned at 6½ per cent, it was discovered that the cost, including interest and administrative expenses, amounted to 9½ per cent. Thereupon loans were stopped. Manitoba raised money for a similar purpose by the sale of 5 per cent "food bonds" and loaned the proceeds at 6 per cent on farm products on an amortization basis. Much doubt was expressed as to whether this plan was self-sustaining. Saskatchewan put into operation a similar plan. It sold 5 per cent 10-year bonds at par with provision for repayment at any time on three months' notice and loaned the proceeds to farmers at 6½ per cent. Another Canadian development was the inauguration of a more liberal credit policy for established farmers by the banks. This plan included the granting of specified amounts of credit to individual farmers, interest to be paid only on the amount used; repayment was allowable at any time but not enforceable without twelve months' notice.

REFERENCES. Aside from various digests of

the original Farm Loan Act made by banking houses and agricultural associations, and articles in the periodical press, the following books were published in 1917: L. G. Robinson, *Financing the Insolvent Farmer*, published by the National Agricultural Organization Society; and H. W. Wolff, *Coöperative Credit for the United States*.

AGRICULTURAL COLLEGES. See AGRICULTURAL EDUCATION.

AGRICULTURAL EDUCATION. AMERICAN AGRICULTURAL COLLEGES. The value of a national system of agricultural education in the country's welfare was demonstrated most strikingly during the year 1917 by the immediate response of the American agricultural colleges to the nation's call for help in mobilizing agriculture. Upon the declaration of war, there was put into operation immediately the greatest organization for food production and conservation that the world has ever known. The machinery for the purpose had been developed gradually during the past half century, beginning with the passage by Congress in 1862 of the land-grant act. The colleges through their divisions of extension and research and through direct coöperation with the Federal government constitute one large efficient machine. See AGRICULTURAL EXTENSION WORK and AGRICULTURAL EXPERIMENT STATIONS.

For the year 1916-17, according to the United States Bureau of Education, 27,803 students were enrolled in agricultural courses in the land-grant colleges (exclusive of those for the colored race). Of this number, 982, or nearly 4 per cent of the total, were engaged in graduate work; 16,189, or 58 per cent, were regular undergraduates; 836, or over 3 per cent, were special or unclassified college students; and 9796, or 35 per cent, were registered for courses of less than four years, but more than ten days in duration.

The enrollment for the year 1917-18 was smaller than that of the preceding year. The reduction was most conspicuous among upper classmen and graduate students, with a slight falling off in the entering class. The decrease was due to students entering military service or accepting positions in the interests of food production and conservation, and in no way indicated a declining interest in agricultural education. On the contrary, a growing interest was shown by the constantly increasing appropriations for maintenances and for buildings and equipment. Colorado during the year provided for a mill-tax levy for the erection of new buildings for a period of ten years, and increased appropriations for maintenance for its agricultural college.

Among other conspicuous appropriations for new buildings may be mentioned: Connecticut Agricultural College, \$120,000; Delaware College, \$514,000; Purdue University, \$100,000; Iowa State College of Agriculture, \$161,081; Maryland College of Agriculture, \$515,000; Michigan Agricultural College, \$200,000; Montana State College of Agriculture, \$100,000; University of Nevada, \$80,000; New York State College of Agriculture, \$225,142; Oregon State Agricultural College, \$115,000; Rhode Island State College, \$80,000; University of West Virginia, \$315,000. The State of Tennessee provided a million dollar bond issue for new buildings at the University.

Progress of the agricultural colleges is shown also in the gradual increase in the requirements for admission. Two in 1917 increased their entrance requirements so that now 47 out of 50 require a four-year high school course, or a minimum of fourteen units, for regular admission. Thirty-eight accepted at least four units for work on vocational subjects for entrance, and 17 insisted upon farm experience as a requirement for graduation, to be satisfied either before or after entering college.

**Administrative relationships.** Unlike other institutions of higher learning, the agricultural colleges were called upon to administer three lines of service approximately equal in importance—resident instruction, agricultural extension, and agricultural research. More or less confusion resulted from attempts to administer these three kinds of service through the traditional form of organization. As a result of the necessity for promoting agriculture along these three lines, large groups of specialists were engaged to work on each of the recognized agricultural subjects. In the process of development, the department, rather than the individual, had become the unit of organization. This condition has resulted in the development of large departments, which sometimes have been administered more or less autocratically; also, in some cases, in administrative conflict between the department head and the director in charge of the kind of service concerned.

With a view to obtaining a better understanding of administrative relationships, the Committee on College Organization and Policy of the Association of American Agricultural Colleges and Experiment Stations through the U. S. Bureau of Education, made a study of the subject. A complete report embodying fourteen recommendations was given in the association proceedings for 1917. These in brief were:

1. That the colleges should be organized on the basis of function rather than subject matter.
2. That the individual specialist capable of working independently should be regarded as the administrative unit and that all specialists engaged in each kind of service be administratively responsible to the director of the kind of service concerned.
3. That the group of specialists engaged in the work of a common subject, regardless of the kind of service, be regarded as a department.
4. That one specialist in each group should be selected as chairman, and that the members of the group be given a voice in such selection.
5. That the department organization be concerned only with subject matter.

Such a form of organization insures (a) unity in planning and prosecuting programmes, whether of resident instruction, extension instruction, or research; (b) the minimum conflict in teachings or recommendations concerning any subject; (c) a clear understanding of administrative relationships; and (d) the maximum of initiative and esprit de corps on the part of the individual workers.

**FEDERAL AID FOR SECONDARY AGRICULTURAL EDUCATION.** The most conspicuous advance in the progress of agricultural education during the year was the passage by Congress of the Smith-Hughes Bill (approved February 23,

1917), which provided for coöperation with the several States and appropriated money for the promotion of vocational education in agriculture, trades and industries, and home economics. In its relation to agriculture the bill provided for coöperation in paying the salaries of teachers, supervisors, and directors of agricultural subjects, and for this purpose appropriates \$500,000 for the year ending June 30, 1918, and gradually increasing amounts each year until 1926, when the mature annual appropriation of \$3,000,000 becomes available. The money was allotted among the States in proportion to their rural population.

Provision was made also for coöperation with the States in preparing teachers of vocational subjects including agriculture. For this purpose the initial appropriation was \$500,000, which was to increase yearly until 1921, when \$1,000,000 annually would become available. These sums were allotted to the States in proportion to their population.

The allotments in both cases were conditioned upon the expenditures of an equal amount by the State. Each State must also provide a State board, which is required to submit to a Federal Board for Vocational Education an acceptable programme for the promotion of vocational education, including the preparation of teachers. The administration of the act was vested in this Federal board, consisting of seven members, including the Secretaries of Agriculture, Commerce, and Labor, and the U. S. Commissioner of Education, as ex-officio members, and three others appointed by the President and confirmed by the Senate. The appointed member representing manufacturing and commerce was Mr. James P. Munroe, of Boston, a graduate of the Massachusetts Institute of Technology, a manufacturer, and a former president of the National Society for the Promotion of Industrial Education; representing agriculture is Mr. Charles A. Great-house, a farmer of Posey County, Indiana, and a former State Superintendent of Schools; and representing labor, Mr. Arthur E. Holder of Iowa, formerly legislative representative of the American Federation of Labor. The chairman of the board was David F. Houston, Secretary of Agriculture, and the secretary was P. P. Claxton, U. S. Commissioner of Education. The executive staff consisted of C. A. Prosser, director; L. S. Hawkins, assistant director for agriculture; L. H. Carris, assistant director for industrial education; Miss Josephine T. Berry, assistant director for home economics; C. H. Winslow, assistant director for research.

For purposes of administration and inspection the country was divided into five sections, each with a representative of the Federal board. The regional headquarters and the respective representatives for agricultural education were as follows: North Atlantic—New York City, R. W. Heim; Southern—Atlanta, C. H. Lane; North Central—Indianapolis, J. A. Linke; West Central—Kansas City, W. F. Cramer; Pacific—San Francisco, W. G. Hummel. Forty-seven States had accepted the provisions of the act by the close of the year.

**TEACHER TRAINING COURSES IN AGRICULTURE.** The progress in the development of teacher training courses in agriculture during the year was shown in Bulletin 38 (1917) of the United States Bureau of Education which indicates

that 40 out of 48 of the agricultural colleges offer courses for this purpose, and that the remaining institutions are now planning courses in response to the financial assistance offered by the vocational education act. The bulletin showed also that 841 men and 18 women were registered for teacher training courses in agriculture during the year 1916-17. From 35 institutions reporting, 513 students were graduated with special training in agricultural education in 1916. Of this number, 229 were known to be engaged in either teaching or directing agricultural work in the schools.

**AGRICULTURE IN THE HIGH SCHOOLS.** The progress in secondary agricultural education was indicated by Bulletin 34 (1917) of the U. S. Bureau of Education. It listed 3772 public and private schools of strictly secondary grade giving instruction and a total of 74,154 pupils studying agriculture.

**AGRICULTURAL EDUCATION FOR NEGROES.** A comprehensive report was just issued on negro education in the United States, a result of several years' investigation on the part of the Bureau of Education in cooperation with the Phelps-Stokes fund. It described the facilities for agricultural education among the colored people. Eighty-five schools of all grades, and including the land-grant institutions, offered instruction in agriculture. The total income of these schools was \$2,013,155; they owned 23,940 acres of land, of which only 10,929 acres were under cultivation. The total value of the school plants, including land, was \$1,766,557. The combined teaching force numbered 1828, of which 115 were teachers of agriculture.

The report stated that "the present equipment and teaching force provide little more than a beginning in rural education," and made recommendations for extending the instruction and training teachers.

**AGRICULTURAL EXPERIMENT STATIONS.** Entrance into the war had the effect of putting the experiment stations of the United States in 1917 in quite large measure upon a war basis. Like other departments of the land-grant colleges, they responded promptly, taking positions of responsibility and leadership, and adapting their work to the needs of the emergency. To a very large degree it was their work and teachings in the past which enabled the nation-wide campaign to be set in motion for stimulating and assisting farmers to greater production, providing protection from insects and disease pests, and the more effective utilization of products. In several cases the directors assumed prominent positions on the State councils of defense, in the local food administration, and on commissions for adjusting agricultural difficulties; and in general they early placed themselves in close cooperation with the agencies dealing with food production and supply. How important a resource these institutions constituted was pointed out by the Secretary of Agriculture in his report for the year. Generations ago the American people had wisely laid the foundations of these agricultural institutions and had given them increasingly liberal support. It was this which made possible the prompt and effective handling of the situation.

The forces of the experiment stations, like those of other institutions, suffered heavy loss

by enlistment in the army and for other war service. Relatively few exemptions from military service were granted to station employees. The losses from draft and resignation seriously crippled the stations and great difficulty was experienced in recruiting their forces.

A new experiment station was authorized for Alaska, which was located in the Matanuska Valley, one of the most promising agricultural tracts in the Territory that was being opened up by the new government railroad. Provision was made for a new high altitude substation in Idaho, to be located in a region of 6000 feet or higher. Massachusetts provided for the maintenance of a market garden substation, located at Lexington, the purchase of land for which had been previously authorized. The system of test farms in North Carolina, conducted under the State Department of Agriculture, was developed into substations of the main station at Raleigh, thus extending to important regions the opportunity for experimenting in such subjects as muck land farming, truck farming, grain and orchard crops, etc. A new experiment station for middle Tennessee was authorized, the State granting up to \$100,000 for buildings and the county in which the station was located bonding itself for \$100,000 to purchase a suitable farm. The new station will receive \$10,000 a year from the State, as will the central station and the one in west Tennessee. In Texas, the State appropriated over \$400,000 for the next biennium for the maintenance and development of the main station and the system of branch stations covering the State. A new administration building for the station was being erected at a cost of upwards of \$85,000.

One of the largest and most complete dairy buildings, to serve the needs of both the college and the station, was dedicated in Nebraska early in the spring. New agricultural buildings were completed or in process of erection in Delaware and West Virginia, and in the latter State the station received a gift of an estate of over 900 acres, well equipped with buildings and a large herd of pure-bred Ayrshires, the total value being about \$120,000.

In an attempt to determine the areas in Canada suitable for flax and hemp, field experiments were conducted at various points and an experimental flax mill was erected at the experimental farm at Ottawa. Research laboratories for special studies of grain rust were established at important points. A new experimental farm was established at Morden in south Manitoba, to be devoted to work in horticulture on a larger scale than heretofore at any of the prairie stations.

In the Philippines a permanent tobacco experiment station was established in the Upper Cagayan Valley. A law recently enacted in Colombia provides for a series of stations for the benefit of agriculture; and in Venezuela a presidential decree established an experiment station for agriculture and forestry, with an acclimatization garden, to be located at Caracas. The agricultural institute of Alnarps, Sweden, was reported to have provided buildings and land for extending the studies in plant heredity under H. Nilsson-Ehle. Such studies were regarded as of the greatest importance at the present time in the interest of more efficient food plants. Italy was to provide a national institute to investigate the relations between

malaria and agriculture, the direct and indirect causes of unhealthiness of malarial districts, and the organization of campaigns against these causes.

#### AGRICULTURAL EXTENSION WORK

The coöperative extension work in agriculture and home economics carried on in the United States under the Smith-Lever Act of May 8, 1914, and other Federal and State legislation in all the States, was greatly expanded during 1917. This was partly due to the annual increase of the Smith-Lever funds by \$1,000,000 and of other State and county contributions, but also to the large amount of additional Federal funds provided in the Food Production Act of August 10, 1917.

Early in the year the evident need of increased food production and conservation led to unusual efforts in these directions by the extension forces throughout the country. Largely through the early campaigns which they conducted the farmers were instructed regarding the necessity for increasing the acreage and yield of staple crops and both rural and city people were stimulated and aided in the making of home gardens. As soon as war was declared the Secretary of Agriculture held at St. Louis a conference of Department and Agricultural College representatives, with other agricultural experts, at which it was agreed that one of the most effective means for promoting the agricultural interests of the United States and its allies would be through the coöperative extension system expanded to reach every agricultural county.

Congress adopted this suggestion and incorporated it in the Food Production Act, which contains the following item: "For increasing food production and eliminating waste and promoting conservation of food by educational and demonstrational methods through county, district and urban agents and others, \$4,348,400." The Secretary of Agriculture allotted this fund to the States Relations Service with instructions to enter into agreements with the State agricultural colleges to expend it, in conjunction with other extension funds, on the work of the three classes of agents for whose support it was understood Congress had made the appropriation, namely (1) county agricultural agents (men), (2) county and city home demonstration agents (women), and (3) leaders of boys' and girls' clubs.

Other bureaus of the Department of Agriculture received funds under this Act for coöperative extension work. In the Bureau of Animal Industry, the Animal Husbandry Division, coöperating with the Bureau of Markets, was to aid in live stock production, including poultry. The Veterinary Division was to provide extension agents to give instruction on animal diseases, especially hog cholera. The Dairy Division undertook to stimulate the production and use of soft cheeses and the utilization of creamery by-products. The Bureau of Plant Industry made arrangements to aid in the control of plant diseases, particularly those of wheat, oats, barley, rye, potatoes, beans, and truck crops. There were also funds for work in sweet and Irish potatoes and peanuts and on the canning, drying, and evaporating of vegetables and fruits. Seed supplies were to be safeguarded by a fund for the purchase, storing, and sale of seeds. The Bureau of

Entomology attempted to meet emergencies regarding insect pests in different parts of the country. The Department was also enabled to do a large amount of emergency publication work, the results of which were available to the extension forces.

The States, counties, and local communities joined cordially with the Department of Agriculture in putting into effect the Food Production Act and made substantial money contributions. The last four months of 1917 witnessed great activity in enlarging and more thoroughly organizing the extension forces throughout the country, and getting them ready for rendering a broader and more effective service relating to food production and conservation during 1918. The force of men agents permanently located in counties on July 1, 1917, was about 1400. At the end of 1917 about 2000 regular and emergency agents were at work in single counties or in larger districts.

During the year over 2500 community organizations of farmers, with a membership of 78,600, had been directly organized by the county agents in the 15 Southern States. In addition, granges, farmers' unions, and church and civic organizations, with about 125,000 members, assisted these agents. About 120,000 farmers conducted demonstrations under the supervision of the agents, on over 2,000,000 acres. Through the influence of the agents 220,000 acres were drained, 460,000 acres were terraced, and 81,000 pieces of improved farm machinery were purchased. Over 4000 silos were constructed and manure was saved on 45,000 farms. Over 100,000 pure-bred or high-grade animals were purchased and 2,500,000 animals were tested for various diseases. The agents made over 800,000 visits to farmers and held 12,000 field meetings. Special efforts were made to hold the acreage of cotton planting within reasonable limits and increase the planting of food and feed crops, with the result that the South obtained unusually large crops of corn, soy beans, velvet beans, cowpeas, peanuts, sweet and Irish potatoes, etc. The corn crop in the 15 Southern States was over 960,000,000 bushels, or more than a fourth of the whole crop of the United States.

In the Northern and Western States over 100,000 farmers were enrolled in the county organizations, commonly called farm bureaus. Many thousands of field demonstrations were made with corn, wheat, oats, legumes, and potatoes, and in the spraying and other care of orchards, treatment of live stock for hog cholera, black-leg, and tuberculosis. The purchase of registered breeding stock, the testing and better feeding of dairy stock, installation of drainage and irrigation systems, home-mixing of fertilizers, and increased use of lime were among the things extensively promoted by the agents. Over 400 marketing and purchasing organizations were formed. As war emergency measures, surveys of supply of seeds, fertilizers, and labor were made, with resulting arrangements for obtaining needed seeds, labor, and tractors. Greatly increased acreage of spring wheat, corn, potatoes, buckwheat, soy beans, and the grain sorghums was brought about.

The women county agents, commonly called home demonstration agents, were actively at work in all the States. On July 1, 1917, there

were about 535 such agents, principally in the Southern States. At the end of the year their number had increased to about 1200. In addition, about 100 agents were employed in the larger cities. Under the impulse of the war emergency there was an enormous expansion of the interest of rural and city women in home gardening, rearrangement of diets, economy in purchases and household management, and conservation of food by canning, drying, pickling, brining, and sanitary storage. The home demonstration agents gave assistance extensively along all these lines. On July 1, 1917, in the Southern States alone over 1,800,000 women and girls were enrolled for demonstration work in food production and conservation. Much attention was also given to home sanitation, use of labor-saving devices, combating of insect pests, care of children, and beautification of the home.

In the Northern States there was great activity in forming organizations through which the agents could work and in assisting existing organizations of women in their voluntary efforts to promote food conservation. It was hoped that the extension of this service into the cities would do much toward bringing country and city women into more sympathetic and mutually helpful relations.

The demonstration work for negroes in the Southern States was materially increased during 1917. On June 30, 1917, there were 66 men agents and 7 women agents carrying on work in thickly settled negro communities along practically the same lines as that among white people. Over 75,000 negro boys and girls were enrolled in clubs. In most States the negro agricultural colleges cooperated in this work.

In the boys' and girls' clubs over 500,000 regular members were enrolled in rural communities in 1917, and over 400,000 more in the cities were engaged in special war-emergency projects. Special emphasis was laid on home gardening, canning, and drying, but there were also numerous clubs engaged in growing corn, potatoes, peanuts, cotton, or other farm crops, raising pigs, poultry, or calves, making bread or other viands, sewing, making various articles used on the farm or in the home, etc. Several thousand club members attended short courses at the State agricultural colleges, many of whom were sent at the expense of the people in their communities because of the excellence of their club work. Much of the club work was done in close cooperation with the schools. The short courses in various branches of agriculture and home economics, often called movable or extension schools, were held throughout the country in increased numbers and were supplemented by numerous meetings of farm men and women.

The large force of extension specialists, with headquarters at the agricultural colleges, representing many branches of agriculture and home economics, were unusually busy, chiefly with matters relating to the war emergencies on food supply and conservation. These officers supplemented the work of the county agents, furnished them advice and assistance, gave instruction in the movable schools and meetings, prepared publications and answered inquiries. Specialists were also sent out by the Department of Agriculture and their number was greatly increased under the Food Production Act. Their work included such things as con-

servation of perishable products, control of plant and animal diseases and insect pests, purchase and distribution of seeds, promotion of pig and poultry clubs, stimulation of production of beef and dairy cattle and sheep, marketing of farm products, improvement and larger utilization of the farm woodlot. Farm-management demonstrations were conducted in twenty-seven States.

The general interests of the cooperative extension work throughout the country were promoted by two extension offices in the States Relations Service of the Department of Agriculture. The work in each State was administered by an extension director, with headquarters at the agricultural college, who was a joint representative of the Department and the college. The work within the State was supervised by State and district leaders of county agricultural agents, home demonstration agents, and boys' and girls' club work. The Federal, State, county, and city extension workers of all classes numbered about 5000.

For the fiscal year beginning July 1, 1917, the total fund available for regular extension work was about \$7,620,000. Of this about \$1,200,000 was derived from direct appropriations to the Department of Agriculture and \$2,080,000 from the Smith-Lever Act, making the total Federal contribution \$3,280,000. This was met by approximately \$4,340,000 from sources within the States, including \$1,800,000 to offset the equivalent allotment of Federal Smith-Lever funds, \$530,000 from additional State appropriations, \$200,000 from college funds, \$1,544,000 from counties, and \$444,000 from local organizations and miscellaneous agencies. About \$3,834,000 was to be used for the demonstrations and other activities of the county agents. Much of their work bore directly on farm-home problems but \$1,040,000 was allotted to distinctive work in home economics. More than \$500,000 was to be used for work among boys and girls. Nearly \$1,500,000 was devoted to the tasks of the specialists. In addition the funds for emergency extension work under the Food Production Act, with additional contributions within the States, aggregated about \$5,000,000, making a grand total of \$12,500,000 available for extension work in 1917.

Farmers' Institutes were held in 1917 under the management of the States departments of agriculture in eighteen States. The number of such institutes was 2951 (with 7338 sessions), with a total attendance of 982,377. In thirty States the institutes were managed by the agricultural colleges and were as a rule made a part of their extension work in agriculture. See AGRICULTURE; AGRICULTURAL EDUCATION.

**AGRICULTURAL LEGISLATION.** LEGISLATION IN THE UNITED STATES. The serious and ever-increasing strain put on the world's food supply by the prolongation of the war led to many important and far-reaching measures designed to stimulate the production of farm products. In the United States the Federal emergency legislation was comprised chiefly in two measures, both enacted on August 10, 1917. One of these was the Food Production Act described elsewhere (see AGRICULTURE). The second was the Food Control Act, under which the United States Food Administration was maintained. This act was designed to assure an adequate supply and equitable distribution

of foods and fuel, and was very comprehensive in scope as regards the handling of products after leaving the farm (see **FOOD AND NUTRITION**). Farmers were particularly interested in the provisions regulating fertilizers, machinery, and feed stuffs, as well as that dealing with wheat prices. This section established for the crop of 1918 a minimum guaranteed price of \$2 per bushel for No. 1 northern spring wheat or its equivalent at the principal interior markets until May 1, 1919, and authorized the President to fix a minimum guaranteed price at other times when deemed necessary. Another section appropriated \$10,000,000 for purchases of nitrate of soda for sale at cost to increase agricultural production during 1917 and 1918. See **FERTILIZERS**.

The Selective Service Law specifically included agriculture among the industries for which persons found necessary to the "maintenance of the National interest during the emergency" might be exempted from military service. Exclusion of farmers or farm laborers as a class was not undertaken in the administration of the law, though many exemptions were made of individuals in the first levy, and a plan of deferred service for men actively engaged in farming was embodied in the questionnaire for the classification of registrants which was sent out in December. Several measures suspending or modifying some of the requirements of the homestead laws during the emergency were enacted. One of these allowed settlers under certain restrictions to leave their claims for farm labor elsewhere and to include this item as constructive residence on their own holdings.

Many States also enacted war legislation affecting agriculture. New York, Porto Rico, and Florida adopted food control laws, that of Porto Rico even authorizing the food commission to grow farm products. In Massachusetts municipalities were empowered to cultivate private lands, and restrictions on Sunday gardening were suspended. Penalties against theft or damage to farm crops and gardens were increased in New Hampshire and Pennsylvania, and trespass laws made more severe in Connecticut. School credit to students absent on farm work was allowed under certain conditions in Connecticut and New York.

The Federal Farm Loan Act of 1916 (see 1916 **YEAR BOOK**, article **AGRICULTURE**) was amended by a bill passing the Senate December 18, 1917, providing for the purchase by the United States Treasury of \$100,000,000 worth of farm land bank bonds at par and accrued interest. A similar measure was the unfinished business before the House of Representatives before its adjournment for the Christmas holidays. Montana and South Dakota provided for State loans on farm lands and a previous law went into effect in Oregon. County loans to farmers to buy seed were authorized in Minnesota. Dealers advancing supplies "on time" during the crop season in North Carolina were forbidden to charge over 10 per cent above their cash prices.

The Federal Stock Raising Homestead Act provided for entries of tracts as large as 640 acres on certain public lands chiefly valuable for grazing and raising forage crops. Prospecting for potash on the public lands was encouraged by Federal action, and a measure dealing with

phosphate lands was under consideration at the close of the year. Oregon authorized the leasing of the kelp fields along its coast for potash production.

In Vermont a Commissioner of Agriculture replaced the Board of Agriculture and Forestry. North Dakota, South Dakota, and Utah adopted the Torrens system of land registration.

The so-called Smith-Hughes Bill, or Federal Vocational Education Aid Act, became law February 23, 1917. It authorized Federal appropriations rising from about \$500,000 to a maximum of \$3,000,000 per annum for coöperation with the States in paying the salaries of teachers, supervisors, and directors in agricultural instruction of subcollegiate grade, as well as like amounts for instruction in industrial subjects including home economics, and from \$500,000 to \$1,000,000 per annum for the preparation of teachers and supervisors along these lines. See **AGRICULTURAL EDUCATION**.

**CANADIAN LEGISLATION.** The principal Canadian legislation of the year was the Soldiers' Settlement Act, designed to assist returned soldiers to settle on the land. This was supplemented by legislation in Ontario, Prince Edward Island, and British Columbia, under which lands will be reserved and put in shape and advances made if necessary for the purchase of land, tools, stock, etc.

Rural credits acts were adopted in Manitoba, Ontario, Saskatchewan, and Alberta providing for long-term loans on farm real estate, and in Manitoba, Alberta, and Nova Scotia for short-term loans for purchases of live stock, seed, grain, or farm machinery. The Dominion Live Stock and Live Stock Products Act regulated stockyards charges and practices.

**EUROPEAN LEGISLATION.** Great Britain enacted a comprehensive measure known as the Corn Production Act, designed to foster agricultural production during the war. This act established an Agricultural Wages Board to fix minimum wages for farm labor. Another provision was for a system of arbitration to adjust disputes over the raising of agricultural rents. Many drastic regulations were also put into effect under the Defense of the Realm Act. Maximum prices were established for the 1917 crop of wheat, rye, oats, and barley, as well as meats and dairy products, and a minimum price guaranteed for wheat, oats, and potatoes. The use of feeding stuffs was carefully regulated and seed grain supplies conserved. The cultivation of unoccupied or common lands, or in certain cases of neglected occupied lands, was empowered. See **AGRICULTURE**.

Under a French law uncultivated lands may be requisitioned and cultivated by the local authorities. An appropriation of \$80,000,000 was made for the agricultural restitution of the region recovered from the German invasion, this being available for tools, live stock, seeds, fertilizers, etc. In Holland the increasing scarcity of food led to a compulsory reduction in the acreage devoted to the less essential farm products. Tobacco growing was prohibited entirely.

**OTHER COUNTRIES.** A comprehensive series of inspection laws was enacted in South Africa. Peru adopted a rural credits law based on personal property. Many other countries adopted laws and regulations as to prices of farm products, as noted under **FOOD AND NUTRITION**.

**AGRICULTURE.** The progress of the war in Europe, the increasing gravity of the submarine menace, and the entrance of the United States into the war all tended to give increasing prominence to agriculture during the year 1917. Food supply and victory were more confidently and understandingly linked together than ever before. Food was classed as being as important as munitions, and a new understanding of the basic position of agriculture and the many factors involved in a sudden increase in production under the handicaps of the war became apparent. This was evidenced in the memorable speech of Lloyd George in February, who also declared that "whatever befalls, it will never again be neglected by any government."

When the United States entered the war, the world's food reserve was very low, distribution difficult, and most of the countries involved were largely dependent on outside supplies. President Wilson made an earnest appeal to the farming people to do their utmost, declaring that "upon the farmers of the country in large measure rests the fate of the war and the fate of the Nations."

**BRITISH AGRICULTURAL POLICY.** The dependence of the United Kingdom on imported food, amounting to four-fifths of its wheat and two-thirds of its food stuffs as a whole, resulted in increasing the cost of the war, complicated the problem of foreign exchange, and made heavy demands on the tonnage of the merchant marine when its services were greatly needed otherwise. This, with the increasing menace of the submarines, aroused Great Britain to a live agricultural policy which was developed and put into effect early in the year. This embodied a comprehensive scheme for increased agricultural production throughout the kingdom, including an enlarged and better use of land, through appeal and compulsory measures, supported by guarantee of minimum prices to the farmers for certain staples and assistance of various forms to the industry. The Lloyd George Government gave the country a new Minister of Agriculture, Mr. R. E. Prothero, a man of agricultural affairs; and a Food Production Department was organized in the Board of Agriculture and Fisheries with Sir Arthur Lee as director-general, and a food controller appointed.

An order relative to the cultivation of land conferred upon the board authority to take possession of any land not being so cultivated as to afford the largest practicable food production, and conduct it to that end, utilizing any buildings, machinery and implements, stock, etc., on the land, alter contracts of tenancy, etc. In turn, the board conferred upon all ruling councils—town, city, urban, and district—powers to take over and cultivate all commons and waste lands, of which there are said to be 20,000,000 acres in Great Britain, to direct grass land to be broken up or cultivated land to be used by the occupier in accordance with the county war agricultural committees, failure to comply constituting an offense under the Defense of the Realm Act. These committees were authorized to plow and apply fertilizers, when an occupier was not able, allowing reasonable time for repayment. Surveys were made of cultivated and uncultivated land, as a basis for action of the committees.

As a part of its policy, the Government guar-

anteed the following minimum prices for wheat, covering a period of six years; for 1917, 60s. per quarter (\$1.74 per bushel); for 1918 and 1919, 55s. (\$1.60 per bushel); and for 1920, 1921, and 1922, 45s. (\$1.30 per bushel). A minimum wage for agricultural laborers of 25s. (\$6.00) per week was announced.

**Production Campaigns.** In the prosecution of the campaign for increased food production there was greater organized and systematic effort than in any previous year of the war. In Great Britain the war agricultural committees were strengthened and extended, and were very active in seeing that land was properly employed for food crops, in many cases taking possession of improperly handled tracts or arranging for new tenants. In some sections of the country, for example, bulb growers were required to take up 25 per cent of their bulbs and substitute wheat, and also to plant 25 per cent of the land left in bulbs with wheat or oats between the rows; and growers of hops were required to reduce the area during the war to one-half that of 1914. These committees were authorized to purchase tractors, and arrangements were made through the war office for manning them, keeping them in repair, and supplying the necessary fuel and lubricants. Four schools were set up for training men in their operation. By the close of the year some 2000 tractors had been placed at the disposal of farmers in England and Wales, with the demand still increasing.

The formation of food production societies was also projected in every village and urban district, especially to promote intensive gardening and acquire land for the purpose. Food production by school children was also stimulated.

British farmers and land owners had been very loath to plow up their pastures and grass lands, and it took both argument and compulsion to bring this about. The director of the Rothamsted Experiment Station gave some striking illustrations of the greatly increased production of food from tilled land as compared with pasture. For example, land in potatoes produces nearly forty times as much food as medium grass land, while wheat land produces nearly eighteen times as much. An acre of these crops yields 15 cwt. of flour or 6 tons of potatoes, as compared with 1 cwt. of meat from an acre of grass. The Board of Agriculture showed that the grass land of the country was feeding about 20 persons per 100 acres whereas the same area of cultivated land feeds about 84 persons. Under the governmental policy adopted it was shown that land would give a greater return to the farmer under cultivation than in grass.

The British food controller fixed the maximum prices for the 1916 crop of wheat at the equivalent of \$2.37 a bushel, of barley at \$1.90, and of oats at \$1.37. The minimum price fixed for the 1917 crop of wheat was \$1.74 a bushel, and for oats \$.88, while the minimum prices for potatoes ranged from \$.85 to \$.95 a bushel, according to time of delivery.

To further encourage the breaking up of permanent pasture and the growth of oats, the British Army Council offered a bonus of about 10 cts. a bushel over the food controller's fixed price, provided the growers would apply fertilizers at the rate of 25s. per acre.

As a result of these various measures, it was estimated that during the season an extra million acres of land had been put under the plow in Great Britain. To relieve the labor situation, the British Army Council extended the period of calling out men employed in agriculture, first set for January 1, 1917, until a complete review of the labor situation could be made on the basis of the agricultural census. Later it was announced that no man who prior or subsequent to June 1 was employed for his whole time in farm work of national importance should be called to the colors except with the approval of the county agricultural executive committee. Special provision was made during the summer to supply soldier labor, and draft horses and mules with drivers, for assistance in preparing land for fall crops. The temporary services of men in the home defense force were made available, selecting those of proper knowledge and fitness, and certain classes of the army reserve who, barring unexpected military exigencies, may remain in agriculture to the end of the war. These measures made available some 20,000 men.

**IRELAND.** In Ireland, the scheme for increased production was in charge of the Department of Agriculture and Technical Instruction, and even more drastic measures were employed. Every farmer was required to till in 1917 an additional 10 per cent of his tillable land, failing which he was subject to a fine of £100 or imprisonment, or the Government might take over the land and re-let it to another tenant. The campaign was organized through the county committees of agriculture, of which there is one in each county in Ireland with a permanent paid staff, including a secretary, one or more agricultural instructors, horticultural instructors, in most cases instructors in poultry and buttermaking, and in some counties special tillage demonstrators.

Prices for wheat, oats, and potatoes were guaranteed, provision made for securing the necessary supplies of seeds, fertilizers, implements and labor, and loans made for necessary purchases. In some districts where large areas of grass land were to be plowed up, tractors were necessary, and to secure these the Department made arrangements to control the distribution of new machines, requiring purchasers to hire them out if not needed all the time. Provision was made for furnishing advice on tractor operations, securing a supply of fuel, providing operators, and for keeping the tractors in repair. In addition, a certain number of tractors were retained under the Department's control which were hired out with drivers and plowmen.

As a result of these voluntary and compulsory measures large additional areas were plowed and cultivated in Ireland, estimated at an increase of 25 per cent, or about 700,000 acres.

**FRANCE.** The French organization for maintaining its agricultural efficiency was described as unusually complete and effective, working from the Minister of Agriculture through the directors of agricultural service in each department of the country, to the committee of agricultural action in each community. Under a law passed in the fall of 1916 the communes were authorized to requisition cultivable lands whose owners neglect to cultivate them, to be

carried on under direction of the committees of agricultural action. The French Government had subsidized the purchase of expensive labor-saving machinery by coöperative societies or communes for collective use, to the extent of one-third of the cost, thus providing tractors for plowing and similar work, which were operated by war cripples. The railroads often gave reduced rates on such tractors, and sent them and their operators free of cost for demonstrations. The French government in 1917 offered a bounty on wheat growing equivalent to 16 cents a bushel, and an additional bounty of \$1.60 per acre for areas in excess of 1916. A minimum price was fixed of \$1.36 a bushel for barley and \$1.32 for rye.

**ARGENTINA.** Working in the interest of the international food production campaign, the agricultural department of Argentina distributed over two million bushels of seed wheat to more than 22,500 colonists in that country who were unable to obtain seed.

**AGRICULTURE IN THE UNITED STATES.** When the United States entered the war, on April 6, 1917, the country was facing an unsatisfactory situation in respect to its supply of food and feed stuffs. The reserve stocks of wheat were lower than at any previous time at that season, and the world's reserves were very low. Under competitive purchasing of all food products by foreign agencies on a large scale, manipulation and speculation were rife and prices were mounting rapidly. The immense drain upon American products was shown by the fact that while the United States had been exporting to Europe less than 100,000,000 bushels of wheat a year before the outbreak of the war, it jumped to 332,000,000 bu. in 1915, was 234,000,000 bu. in 1916, and in the fiscal year ended June 30, 1917, when the crop was abnormally small, it amounted to 203,578,609 bu. (including flour), the imports for that year being only about 25,000,000 bu.

The short food supply of the Allies and neutrals in Europe, and the fact that the wheat reserves of India, Australia, and Argentina were held back for lack of tonnage, made it evident that special reliance would be placed on the United States, and that every possible effort was necessary to meet the needs of the country and of Europe. Nation-wide agitation was set on foot for enlarged production of food materials, especially the bread grains, for extensive gardening to supply local needs, and for conservation of food of all kinds in every possible way.

Early in April a conference was called by the Secretary of Agriculture at St. Louis, at which the agricultural colleges and departments of agriculture of thirty-two States were represented. The entire agricultural situation presented by the emergency was discussed and a comprehensive programme of action was adopted. This programme provided for a central agricultural body in each State, to mobilize its agricultural resources and coöperate with the Federal Department of Agriculture in prosecuting and assisting a vigorous production campaign. It also contemplated a survey of the food, labor, and other resources of the country, the fixing of prices of certain products in order to furnish assurance to farmers, and certain necessary Federal legislation.

The latter was embodied in two separate

acts, known as the Food Production Act and the Food Control Act, which became effective August 10. The Production Act appropriated a total of \$11,364,400, and extended the functions of the government in many ways, enabling an enlargement of the agricultural extension work (see AGRICULTURAL EXTENSION WORK), providing for food surveys, assistance in marketing and distribution, the supply of seeds, combating insect pests and plant diseases, stimulating the production of live stock, meat supplies, etc. The Food Control Act conferred very broad powers, authorized the fixing of prices to stimulate production and prevent extortion, and the general regulation of food and its distribution. See AGRICULTURAL LEGISLATION and FOOD AND NUTRITION.

Under authority granted in the Food Control Act, a Federal Grain Corporation was organized which took over the purchasing of wheat for export and controlled the margin of profit among trading, milling, baking, and distributing factors. To finance this enterprise, Congress made an appropriation of \$150,000,000. The stock of the corporation is all owned by the government. All flour mills producing 100 barrels a day or more were required to be licensed and to purchase their wheat through this corporation or under its regulations. No other agency was authorized to export wheat.

Under the stimulation of purchases by the allied governments, May wheat had gone to \$3.18 on the Chicago Board of Trade, when the directors discontinued trading. The Food Administration determined upon a price of \$2.20 a bushel for the 1917 wheat crop, based on No. 1 northern spring wheat or its equivalent in the principal interior markets, with a system of differentials between zones and between different grades and classes, and on this basis the Federal Grain Corporation began September 4 to buy and distribute the wheat crop of the United States. The effect has been to stabilize prices, to reduce the cost of wheat and flour, and to give farmers assurance of what could be expected. The price fixed by the Food Control Act for the 1918 crop, continuing until May, 1919, is \$2 per bushel.

THE 1917 HARVEST. Probably never in modern times was there such widespread consideration of the prospective food supply of the world as in 1917. This was intensified by the announcement early in the year that the prospect for the world's food crops was insufficient and the situation alarming. This was largely borne out by the final returns. Such returns as were available near the end of the year are shown in the accompanying table. No data then had been published for the countries of the Central Powers.

In most of the countries at war the production of cereals fell off materially, in spite of efforts to keep up the area and yield. It was evident that under the pressure of war, Europe was fast declining in productive power. The International Institute of Agriculture reported that the production of wheat, rye, and barley was below the average, wheat in the countries exclusive of the Central Powers being estimated at 15 per cent below the five-year average. The crops of corn, oats, potatoes, and rice, however, were considerably above the five-year average, and except in the case of rice were from 15 to 35 per cent larger than in 1916. The

wheat crop of India was estimated at about 5 per cent above the average and 19 per cent above 1916.

Great Britain had the largest crop of potatoes ever produced, estimated at a million and a half tons more than the average for the previous ten years. Canada succeeded in materially increasing its area under wheat, despite the wholesale withdrawals of labor for the army. While definite data were lacking for Russia, the indications were that all cereals were below the average, amounting for wheat to 20 per cent. The enforced leasing of land to peasants, which was formerly worked by the landowners, resulted in lack of skilled methods and good seed being employed, the effects of which were reflected in a decreased yield. Press reports gave an estimated decrease in the yield of wheat in the Central Powers of 40 per cent, and of 45 per cent for rye, oats, and barley.

The United States produced record crops of corn, oats, rye, potatoes, and tobacco; the rice crop was the second largest produced in this country, and the barley crop has only twice been exceeded. Although the wheat crop was disappointingly light, the aggregate returns for all cereals represented an increase of approximately one billion bushels over the five-year average. The bean crop was nearly 50 per cent greater than in 1916. There was the largest production of perishables on record. The area of rye was increased about 50 per cent over the five-year average and of barley about 10 per cent. The area in corn was increased about 14 per cent. See also individual crops such as WHEAT, POTATOES, etc.

CONSERVATION AND CONTROL MEASURES. Food control measures in various countries are described in the articles FOOD AND NUTRITION and FOOD CONTROL. In further regulation, the use of barley or other cereals or food materials for the production of liquors was prohibited in the United States, Canada, and Great Britain (see LIQUORS). The United States Internal Revenue figures show that in the fiscal year 1916 no less than 107,781,415 bu. of grain were used in the manufacture of fermented and distilled liquors. The cultivation of hops was restricted in Great Britain and buying or selling was made subject to permit by the food controller.

Various measures were enforced to provide suitable supplies of seed. An order issued in August in England and Wales prohibited the use for other than seed purposes of any of the 1917 crop of winter oats up to November 1, of winter beans up to December 1, or of rye up to January 1, 1918, except upon authority of the food controller. The use of seed potatoes for any other purpose than seed, and the sale or purchase of seed potatoes except through authorized purchasers was prohibited in Great Britain.

Flax growers in Ireland were required to save seed from one-eighth of the total crop, the seed to be sold only to persons authorized by the Department of Agriculture complying strictly with its regulations. The British Government took possession of all flax for aeronautical supplies, fixing the price for different grades and forbidding sale or purchase except through the Government. In July, the British food controller forbade the purchase or sale without a permit of any wheat, barley, rye, or oats of the 1917 crop, or any potatoes except

ESTIMATED PRODUCTION IN 1916 AND 1917 OF WHEAT, RYE, OATS, BARLEY, AND MAIZE IN BUSHELS

a Not including invaded territory.

the first and second earlies. All contracts previously made were declared annulled. Australia took over the whole wheat production under government control.

Canada removed its tariff on wheat and wheat products in April, which had the effect of automatically removing the United States duty on imports of Canadian wheat, thus permitting the free movement of wheat from that country. In Great Britain, the former requirement of a yield of 76 per cent of flour from wheat was increased by at least 5 per cent, to be accomplished either by closer milling or by the addition of flour from barley, maize, rice, or oats. A further addition of 5 per cent was permitted, thus giving a return of 86 per cent of flour for the wheat milled. Italy promulgated a milling requirement of 85 per cent of flour, and prohibited the taking from wheat of any other substance than bran.

A director of feeding stuffs was appointed in Great Britain to organize the supply and distribution of oil cakes and other cattle feeds, and regulations were issued as to feeds which might and might not be fed to stock. A horse-rationing order was issued in September, restricting the amounts and kinds of feed to be fed to horses except those of the army and those used exclusively for agricultural purposes; and in England and Wales the sale of horses used or suitable for the cultivation of land was prohibited except under license.

The feeding of game birds on grain or other materials suitable for human food was forbidden, and the Board of Agriculture was authorized to kill and dispose of game birds and extend the time for taking pheasants, wild ducks, and other migratory birds.

The German Agricultural Council published during the year lists for farmers of prohibited and allowed feeds for stock. The lists excluded nearly everything which might possibly be used for human food except barley, oats and root crops, in restricted amounts.

**PRODUCTION PROGRAMME FOR 1918.** While food production viewed from a world standpoint gave evidence of an adequate supply from the 1917 crop, the lack of tonnage and the increased risk in bringing such staples as wheat from the distant fields of India and Australia emphasized the necessity for extraordinary effort in other countries. The United States and England especially made unusual preparations for the harvest of 1918. For the first time in its history, the United States adopted a definite agricultural programme, made with reference to meeting in even larger measure the needs of its European allies. This programme was drawn up after a thorough study of the situation by its officers and experts, in consultation with specialists from the various States. It called for the fall planting of about 47,337,000 acres of winter wheat and 5,131,000 acres of rye. The aim in the case of wheat was the production of a billion bushels in 1918, and the tentative figures for seeding spring wheat were left until the condition of the winter crop could be determined.

The area contemplated would require an increase of about 15 per cent for all wheat and over 50 per cent for rye. The increased acreage was apportioned among the States, and campaigns were conducted through the extension forces and other agencies to secure the seed-

ing of these areas. The fall of 1917 was unfavorable to carrying out the Department's programme for wheat and rye to the full extent. It was estimated, however, that over 42,000,000 acres had been seeded to wheat, the largest ever sown. The area of rye seed is over 6,000,000 acres, nearly 37 per cent more than in 1916. The programme adopted for other crops involved an increase of about 5 per cent in oats and decreases of 6 per cent in barley and 8 per cent in corn (maize). Programmes for spring seeding of cereals and other crops are to be issued.

In Great Britain the Prime Minister announced in June the official programme for bringing about 3,000,000 acres more land under cultivation in England and Wales than was employed in 1916, showing that that country is thoroughly aroused to the danger of food shortage. This programme involved an increase of nearly 50 per cent in the area in cereals, beans, and peas, of 40 per cent in potatoes, and large increases in roots and other fodder crops. It involved the plowing up of about 2,400,000 acres of permanent and temporary grass, or an increase of nearly 30 per cent, and approximately one-eighth of the grass land. The amount was prorated among the counties, under the direction of the county agricultural executive committees, who were given power to enforce the requirement. The programme looks beyond 1918, and aims "to increase to the maximum the productions of food at the harvests of 1918, 1919, and 1920." For Ireland, the Government requirement was the bringing of 5 per cent more land under plow in 1918 than in 1917.

The cultivation of flax having become a military necessity, the Department of Agriculture in Ireland made a strong appeal to farmers to maintain the usual area, and to insure seed an order of the Army Council made it obligatory on Irish farmers to save the seed from one-eighth of the 1917 flax crop. This could not be sold except to persons licensed by the Department of Agriculture, which prescribes its handling, classification, and price.

In New Zealand, the purchase by the government of the wheat crop of 1917-18 was authorized, the price being fixed at \$1.41 a bushel. Traffic in wheat was forbidden except under permission of the Board of Trade.

**FARM LABOR.** The war accentuated the already serious shortage of labor on farms in the United States, the military service and manufacturing industries making large inroads on the supply. The government declined to exempt farmers and farm laborers as a class from the operations of the draft, but the new classification made at the close of the year apparently placed them in a somewhat more favorable position.

The Departments of Agriculture and Labor early in the year entered into coöperation, the former conducting a survey of the farm labor needed and the supply in rural districts, and assisting State agencies in organizing it; and the Department of Labor devoting its employment service to procuring and distributing workers not of the regular farm labor class. Many of the agricultural and other colleges closed early or released students to engage in agricultural work. In some of the agricultural colleges as high as 90 per cent of the undergraduate body had gone out into either military or agricultural service by the first of May.

Thousands of students took part in the wheat harvest. Foreign women were employed in market gardens and tobacco fields, and a movement was on foot to induce American-born women to offer themselves for farm work.

At the close of 1916 provision was made in England for employing civilian prisoners of war on farms not in prohibited areas. During the year large numbers of these prisoners were employed, the reports being generally very satisfactory. Lists of certified agricultural occupations were prepared by the Board of Agriculture, with a view to exemption from military service under certain conditions.

The work of women on the land became an increasingly important factor in England. Women workers were recruited through women's farm labor committees and a women's land army was formed on the initiative of the women's war agricultural committees. There were reported to be some 250,000 women engaged in agricultural work. The Board of Agriculture gave considerable attention to securing suitable conditions of service, with a view to attracting non-resident and town-bred women, the aim being to recruit as many as 40,000 from these sources. An appeal for women tractor drivers for plowing was issued late in the fall by the food production department, the need growing out of the unusually large amount of grass land which was being broken up. Considerable interest was developed in competitive tests of women land workers, representing a large number of counties. The women performed all kinds of agricultural operations, even to plowing, mowing, milking by hand and machinery, and the operation of motor tractors. Farmers expressed both pleasure and surprise at the work done.

High tribute has been paid to the women of France, who by common testimony have made a splendid showing of service "in the trench which is the furrow."

**LITERATURE.** The significant feature of the agricultural literature of the year, as a result of entrance into the war, was the tremendous output of popular emergency material of a new sort—exhortation and precept cast into pictorial, mimeographed, or printed form in bulletins, posters, circular letters, etc. National and State institutions and private organizations contributed to this endless variety of advice and appeal, the U. S. Department of Agriculture and the State agricultural colleges leading. Without attempting to enumerate these publications, a few summarizing the situation may be mentioned:

*Report of the [U. S.] Secretary of Agriculture, 1917* (Washington, 1917); *Report of the Food (War) Committee of the Royal Society* (Command Paper Cd. 8421, London, 1917); John Hilton, "The Foundations of Food Policy"—a review of the report of the Royal Society Committee in *Edinburgh Review*, 1917, No. 461, pp. 28-50; T. B. Wood, *The National Food Supply in Peace and War* (Cambridge, 1917); W. Somerville, "Increased Agricultural Production," in *Blackwood's Magazine* (January, 1917); Joseph Johnson, *Food Production in France in Time of War* (Dublin, 1917).

**AIRCRAFT.** See **AERONAUTICS**; **MILITARY PROGRESS.**

**AIRPLANE.** See **AERONAUTICS**; **MILITARY PROGRESS.**

**ALABAMA. POPULATION.** The estimated population of the State in 1910 was 2,138,273, and on July 1, 1917, it was 2,363,939.

**AGRICULTURE.** The acreage, production, and value of the principal crops as estimated by the United States Department of Agriculture in 1916-17 were as follows:

		Acreage	Prod. Bu.	Value
Corn ....	1917	4,825,000	77,200,000	\$96,500,000
	1916	8,825,000	47,812,000	48,768,000
Wheat ...	1917	98,000	980,000	2,511,000
	1916	110,000	1,045,000	1,933,000
Oats ....	1917	540,000	9,720,000	9,914,000
	1916	600,000	10,500,000	7,875,000
Rice ....	1917	400	12,000	23,000
	1916	300	8,000	6,000
Potatoes ..	1917	41,000	2,952,000	5,373,000
	1916	20,000	1,800,000	3,042,000
Hay ....	1917	1,448,000	a 1,158,000	18,760,000
	1916	400,000	440,000	5,720,000
Tobacco ..	1917	200	b 148,000	51,000
	1916	200	60,000	18,000
Cotton ...	1917	2,195,000	c 505,000	70,700,000
	1916	8,225,000	533,000	52,007,000

a Tons. b Pounds. c Bales of 500 pounds gross weight.

**MINERAL PRODUCTION.** Alabama ranks third in the production of iron ore, being surpassed only by Minnesota and Michigan. The total production in 1916 was 6,747,901 gross tons as compared with 5,309,354 gross tons in 1915. The total amount of ore shipped from mines in the State in 1916 was 6,801,839, valued at \$10,843,231, compared with 5,134,955 tons valued at \$6,789,266 in 1915, an increase of more than 32 per cent in quantity and more than 59 per cent in value. The output in 1916 was 18,086,197 short tons, valued at \$24,859,831. This was an increase of 3,158,260 tons in quantity, and \$5,793,788 in value compared with 1915. The number of employees increased from 22,591 in 1915 to 25,308 in 1916.

**CHARITIES AND CORRECTIONS.** The charitable and correctional institutions include the Confederate Soldiers' Home at Mountain Creek; the Alabama Industrial School for white boys at East Lake; the State School for the Deaf and Blind at Lineville; the Reform School for Juvenile Negro Law Breakers; a school for the negro deaf and blind; and insane asylums at Tuscaloosa and Mt. Vernon.

**POLITICS AND GOVERNMENT.** Alabama's most notable activities during 1917 were in connection with the war. The figures of Adj. Gen. G. J. Hubbard show that on July 1, 1917, there were 7651 enlisted men in the national guard and regular army from Alabama. Alabama's quota in the first selected draft was 13,614 men, of whom 5329 were white and 8285 negroes. These figures include no voluntary enlistments since July 1 nor do they include any enlistments at any time in the marine corps or the navy. Two national guard concentration camps were located in the State, Camp McClellan at Anniston and Camp Sheridan at Montgomery. An aviation field was also located at Montgomery late in the year.

The State has seen remarkable industrial development during the year, much of which is traceable directly to the war. The United States Steel Corporation in August appropriated \$11,000,000 to the Tennessee Coal, Iron and Railroad Company, a subsidiary, to build plate mills and other units at Birmingham to supply material for ship construction. The Tennessee

1. TRACTOR PLOWING

2. HARROWING LAND

3. FEEDING CALVES

ENGLISH WOMEN IN AGRICULTURE

company had this work well under way at the close of the year. The Tennessee company formed the necessary subsidiaries, the Chickasaw Shipbuilding Company and the Chickasaw Land Company, which began the construction of a shipbuilding plant at Mobile. This plant will have ten ways at the beginning and will represent an additional investment of nearly \$12,000,000. On October 7 natural gas in large quantities was discovered on the Aldrich dome eight miles south of Birmingham in the Cahaba River valley. Late in November C. H. Nesbitt, State mine inspector estimated that Alabama's coal production for 1917 would approximate 21,000,000 tons. This is against 18,324,825 tons for 1916, the largest previous production. A serious coal miners' strike involving approximately 22,000 men was averted in Alabama during the summer by the intervention of Secretary of Labor W. L. Wilson, who came to the district with Federal arbitrators and arranged a basis for the continuation of work. The Federal government during the year began the construction of an experimental plant at Sheffield for the manufacture of nitrogen from the air. Announcement was later made that the government would proceed with the development of the latent water power energy at Muscle Shoals near Sheffield, representing an expenditure of about \$20,000,000. The plant is to recover nitrogen for use in the manufacture of explosives. Joseph H. Woodward, president of the Woodward Iron Company and the wealthiest man in Alabama, died at Birmingham December 15.

While the Democratic primary for the governorship and other State offices will not be held until 1918, four candidates for the executive office were already active in 1917. They were Lieutenant Governor Thos. E. Kilby of Anniston, W. W. Brandon of Tuscaloosa, John H. Wallace of Huntville, and W. L. Teasley of Montgomery. A new feature in Alabama politics during the year was the injection of anti-Catholicism as a political issue. It was a striking feature in the campaign for city commissioners in Birmingham, the anti-Catholic ticket winning by big majorities on October 8. Platforms of the candidates for governor indicated that the issue would also cut a prominent figure in the contests for the executive offices of the State the following year.

**LEGISLATION.** The sessions of the State legislature are quadrennial, and none was held in 1917. There were no elections during the year, and no political events other than those noted in the paragraphs above.

**STATE OFFICERS.** Governor, Charles Henderson; Lieutenant Governor, Thos. E. Kilby; Secretary of State, John Purifoy; Auditor, M. C. Allgood; Attorney-General, W. L. Martin; Adjutant General, G. J. Hubbard; Treasurer, W. L. Lancaster; Superintendent of Education, W. F. Feagin; Commissioner of Agriculture, J. A. Wade; Commissioner of Insurance, C. B. Smith—all Democrats.

**JUDICIARY.** Supreme Court: Chief Justice, John C. Anderson. Associate Justices, Thos. C. McClellan, J. J. Mayfield, A. D. Sayre, Ormond Sommerville, William H. Thomas and L. D. Gardner; Clerk, Robert F. Ligon.

**STATE LEGISLATURE.** Almost wholly Democratic. **ALABAMA, UNIVERSITY OF.** Situated at University, Alabama. Students in the fall of 1917 numbered 1750, and there were 140 mem-

bers of the faculty. Volumes in library, 40,000. Productive funds, \$1,200,000; income therefrom \$215,000. Founded in 1831. Co-educational and State institution. Departments: arts and sciences, education, medicine, law, and engineering. President, George Hutcheson Denny, Ph.D., LL.D., D.C.L.

**ALASKA.** The war conditions of the year materially interfered with the development of the Territory. Increased cost of fuel, advances in wages, shortage of labor, reduced transportation, and other enlarged expenses affected adversely gold mining—both lode and placer. Fortunately the expenditures connected with the railway construction by the United States relieved business depression to a considerable extent, while copper mining, stimulated by high prices, reached a maximum output in quantity and in value. The most surprising event of the year was the unequalled productivity of the salmon industry, which reached proportions and attained values far beyond the most sanguine estimates. Increased shipments of salmon late in the year, aggregating for the nine months ending September, 1917, more than \$8,000,000 in value over the same period for 1916, indicated that the entire output for 1917 was in excess of \$40,000,000, four times the value of the salmon pack ten years before. Among other material benefits to the Territory during the year were the restoration of the seal herd, the increase of the reindeer, the greater utilization of the forests, the development of coal mines, and especially the rapid progress of the government railway, which led to permanent settlements in the Cook Inlet region. The improved condition of the native population, the increase in education for the children in towns and districts, and particularly the constructive and progressive laws enacted by the Alaskan Legislature of 1917 were factors of special moral import.

**POPULATION.** The number of inhabitants was estimated at 75,000, of whom about 25,000 were natives. There was no increase in the number of incorporated towns, but several new towns were laid out by government survey and occupied along the railroad. The largest town, Anchorage, had a population of 5000 or more, while the towns of Matanuska and Nenana had several hundred each. The natives, especially in southeastern Alaska, were gathering into separate and locally governed communities, and availing themselves of the law of 1916 that permits citizenship and local government. In 88 villages there were gathered 9234 persons, mostly managing their own affairs.

**LEGISLATION.** The third session of the Alaskan Legislature, begun in January, 1917, was marked by the enactment of many laws of the most beneficial and progressive character. Among these were acts for a direct primary; the establishment at Fairbanks of the Alaska Agricultural College and School of Mines; for the detection of crime; granting allowances to mothers of dependent children; requiring licenses before contracting marriages; prohibiting the sale of tobacco in any form to minors; establishing evening schools for the training of uneducated alien applicants for citizenship; incorporating coöperative associations; organizing a fish commission; for the protection of natural spawning grounds; for the rescue of lost persons; creating a Board of Education;

for a system of public schools in towns and unincorporated districts; prohibiting the importation, manufacture, and sale of intoxicating liquors for sale or gift; for a national guard; for the preservation of public peace, prevention of sedition or other unpatriotic acts.

**COMMERCE.** The volume of shipments from and into Alaska during the fiscal year ending June 30, 1917, amounted in value to \$121,265,947, being the largest in the history of the Territory, and in excess of the commerce of 1916 by \$23,295,297. Domestic manufacturers from the United States showed an increase of about \$12,000,000, of which machinery and hardware amounted to over \$4,000,000, and provisions to over \$2,000,000, beyond shipments of 1916. Shipments from Alaska in 1917 increased over those of the previous year by the sum of \$11,970,000, due almost entirely to fish products, \$4,200,000, and copper ores, \$6,600,000. Shipments since July, 1917, increased by several millions over the preceding year, thus indicating a yet larger volume of trade for 1918.

**FISHERIES.** The report of U. S. Fish Commissioner H. M. Smith showed that all branches of the Alaska fisheries—except whaling and halibut—were more valuable during the year than ever before. In 1916 the fishery personnel numbered 23,994, an increase of 1532, while additional investments were made to the amount of \$2,500,000 over that of 1915, bringing the sum up to a total of \$39,570,000. The value of the fish products was \$26,157,000, surpassing that of 1915 by more than \$5,150,000. This extraordinary record was sure to be exceeded by the yield of 1917, which promised to approximate a value of \$43,000,000. The minor products of the year were as follows: Halibut, \$679,463; herring, \$418,076; and whale, \$363,721. An improvement was made in the curing of herring by using the Scotch method of drying.

**SALMON INDUSTRY.** The salmon continued to be the most valuable of the fishery products. It represented 88 per cent of the investments, and 92 per cent of the total values. In 1916 there were 100 canneries in operation, an increase of 15 during the year. The yield of the salmon fishery had never before been equaled, or indeed approached. The pack in 1916 reached the astounding total of 4,900,627 cases (48 1-lb. cans to a case), valued at \$23,269,429. The total number of fish taken exceeded 72,000,000. The proportionate per cent of various kinds taken, arranged in the order downwards of the kinds as valued commercially, was as follows: Red (or sock-eye), 54; king (or spring), 2; coho (or silver), 6; humpback (or pink), 36; and chum (or Keta), 2.

The supply of salmon was maintained by the closing of natural spawning waters to fishermen, and through salmon hatcheries, of which there were two government and four private. In the calendar year 1916, 172,000,000 red or sock-eye salmon eggs were taken, and 39,000,000 humpback salmon eggs collected. The territorial law for the protection of natural spawning grounds was destined to give some of the much-needed care for this valuable fishery. Meantime the Secretary of Commerce closed to fishing on and after January 1, 1918, the following streams: Karluk River and Lagoon and all tributary streams; Bering River and all tributary streams, including parts of Bering Lake.

**FUR SEALS.** The North Pacific Pelagic Sealing

Convention of July 7, 1911, between Great Britain, Japan, Russia and the United States continued in force and was rigorously observed. Under its provisions regarding closed seasons, the agreed specified payments were made to the contracting nations. The Act of Congress of August 24, 1912, forbidding for five years the taking of seals at the Pribilof rookeries, expired by limitation. The complete success of this legislation for the restoration of the herd is shown by the following data of seals counted at the Pribilofs: 1913, 268,305; 1914, 294,687; 1915, 363,872; 1916, 417,281, and 1917, 468,692. During the summer of 1917 128,024 pups were born, and there were bachelors and idle bulls to the number of 104,000 and more. When commercial sealing begins in 1918 the herd should number 600,000. Dr. Hugh M. Smith, U. S. Commissioner of Fisheries, said: "There is every reason why the herd should now be managed so as to satisfy legitimate demand for its natural economic products, at the same time producing an increased revenue for the government."

The United States has continued its policy of selling at public auction the skins of seals killed for food for the natives, which numbered 6466 in 1916. In 1917 there were sold 6379 skins for \$269,665, the skins being dressed, dyed, and machined under methods initiated by the Secretary of Commerce. This success in handling the skins of seals used for food forecasts the policy of the United States, which undoubtedly will conduct the entire control of the seal industry, from the taking of the seal to the sale of its dressed skin. It may be added that under entire government supervision, the natives of the Pribilof group, which is a closed reservation, were prospering materially and improving morally. One-eighth of the entire population in 1917 had savings in the hands of the government, averaging \$125 per person. Satisfactory experiments were made to utilize the old deposits of seal bones, etc., as fertilizers. There were in progress experimental methods for the preservation and canning of fresh seal meat as a food supply.

**FUR-BEARING ANIMALS.** Apart from the seals Alaska furnishes more than 180,000 pelts from its land animals. The principal skins for the years 1914, 1915, and 1916 were as follows: Bears, 802, 782, and 1189; ermine, 6873, 3538, and 4345; foxes, 23,343, 19,537, and 25,135; lynx, 6930, 9374, and 21,008; marten, 6497, 3028, and 3100; musk-rat, 101,202, 32,933, and 101,287; land otter, 1008, 980, and 1330. Owing to its diminution in numbers the taking of martens was prohibited until 1921. In the Pribilof group there were taken 39 white and 567 blue foxes. The average price of these skins at auction was \$61.11, but four "extra fine dark" pelts brought \$132 each. Fox-farming by private parties continues with moderate success in the valleys of the Chilkat, Copper, Tanana and Yukon, on the Shumagin islands and in the Afognak-Kodiak region. Under the orders of the Secretary of Commerce the taking or killing of fur-bearing animals is prohibited: Beaver until 1918; sea-otter until 1920; foxes (in the Afognak region only) until 1918; and marten until 1920. Except for destructive and dangerous animals a similar order was in force during the breeding season, as to all other animals.

**VOLCANOES.** During 1917 Mt. Martin was added to the list of active volcanoes in Alaska. At times columns of steam and accompanying debris shot up to the height of a mile or more. This peak adjoins Mt. Katmai, the volcano that in 1912 blew off its head in the most violent eruption of modern times, which devastated 10,000 sq. mi. of territory. Katmai is yet active but in a modified form, its vast central crater, nine miles in circumference and 3000 feet deep, being in almost quiescent condition. The volcanic energy of the region is expended in other forms. Enormous fissures were visible over the country, with numberless fumaroles ejecting gases and ashes, and a mud river nearly twenty miles in length drains seaward the accumulated output of the fumaroles.

**REINDEER.** The reindeer industry, inaugurated in 1893, has proved to be of incalculable benefit to the natives of Alaska. It has inculcated thrift, encouraged industry, initiated self-dependence, and transformed thousands of roving, wretched hunters into intelligent pastoral communities. Most encouraging and interesting was the summary made by the Bureau of Alaskan Education of the expenditures, assets, and incomes of the reindeer industry. From 1893 to 1916 inclusive the United States had made appropriations aggregating \$312,000. Meanwhile the income of the natives amounted to \$470,837; the income of the Lapps and Missions was \$146,926. The deer owned by the natives were worth \$1,401,125, and by the Lapps and Missions \$652,650. This made the net benefits \$2,359,538. The annual benefits exceeded \$400,000. It seemed certain that by 1918 the herds would exceed 100,000 head. The distribution of the 82,151 deer on June 30, 1916, was as follows: 1193 natives owned 56,045 animals; the Lapps and other whites, 17,530; the Missions, 5186; and the United States, 3390. Commercialism is seeking the control of the industry, and as a native cannot sell a doe to a white person the Lapps and Missions are appealed to. Unfortunately some of the Mission deer have been sold to the organized company, the sale being opposed by the Bureau of Education as these deer were given to the Missions for the benefit of the natives. The surplus male deer, of whom there are now thousands, are gradually slaughtered for hides and meat by the natives, and for the local market. It is possible that these herds may eventually furnish meat to the Pacific coast regions.

The deer have been introduced in all the regions of western Alaska from Point Barrow southward to the Aleutian archipelago, and to the Pribilof group. Deer are to be sent to the Copper River country and to the upper Kuskokwim Valley.

**NATIVES.** War conditions have in many cases caused the natives to resort almost entirely to local resources for food and necessities of life. That they have succeeded is shown by the fact that during the fiscal year 1916-17 only \$2000 was spent in the relief of destitute natives, eight cents to a person considering the whole population. The segregation of the natives in self-ruling communities, on government reservations, has progressed steadily. Such villages are ruled by council, and in some instances conduct coöperative stores, do commercial business, have common gardens, and even operate saw-mills and canneries. The condi-

tions at Metlakatla have materially improved: the fishery rights are assured and leased, while the coöperative cannery and other industries guarantee future prosperity.

The Alaskan Division of the U. S. Bureau of Education has continued its invaluable work through 70 schools, with an enrollment of 3600 pupils. The purely practical instruction has done much to uplift the natives, being confined to commercial matters, gardening, health, domestic science, manual training, and sanitation. The officials also afford medical relief, so needful for a people afflicted largely by trachoma, tuberculosis, and venereal diseases. The Bureau's agents have also established a system by which the furs and products of natives at remote stations are sold at public auction in the States and needful supplies bought at wholesale in return.

Governor Strong reports on the status and improvement of natives. The economic independence of the deer owners is assured. In steadily increasing numbers they are registering as citizens. Reports from 88 villages having a population of 9234 covers nearly 40 per cent of the natives in Alaska. Of the adults 26 per cent, and of the children of school age 60 per cent, could read and write. Among 5000 adults there were 118 captains and pilots, 53 engineers, 41 teachers and preachers, 119 carpenters, 59 miners, and 306 reindeer men. They owned among their large fleet 208 power boats, of 4.9 average tonnage, equipped with 8.4 average horsepower engines. The 9000 also owned 132 organs, 1837 bedsteads, 2078 clocks, and 1843 sewing machines. The civilization of the Eskimo in northwestern Alaska was illustrated by the issue at Nome of a new publication, *The Eskimo*, which was not only devoted to the interests of the natives but regularly published contributions in English written by Eskimos.

**ROADS AND TRAILS.** The development of the Territory depends as much, if not more, on roads and trails than on any single railway. Congressional appropriations and the Alaska Fund (made up from a fixed percentage of taxes, etc.), from which roads in the past have been constructed, are now supplemented by a territorial appropriation of \$400,000. This amount has been allotted to the four judicial districts, \$25,000 to be spent in each in the years of 1917 and 1918. The total road mileage on June 30, 1916, was: Wagon roads, 980; sled roads, 621; trails (flagged in winter), 2291. Work recently completed includes wagon roads on the Marshall, Ruby-Long, and Knit-Willow sections, and a winter trail from Nenana to the Kantishna country. It was anticipated that the road construction would soon pass entirely into the hands of territorial officials, a Territorial Road Commission having been organized. Three important bridges were built at an expense of \$87,000; during the year, across the Tanana and Snake rivers, and at Fairbanks across the Chena.

**RAILROADS.** The only railroads operated during the year were the Copper River and Northwestern, from Cordova to Kennecott; the White Pass and Yukon, from Skagway to White Pass; the Tanana Valley, from Fairbanks to Chatinika; and the Yakutat and Southern at Yakutat Bay. The Katalla Anthracite Railway Co. was constructing a railway, to be about 20 miles in

length, from Controller Bay to the Bering River coal fields, for the development and utilization of patented coal lands in that section.

The important railroad operations, however, pertained to the United States railway under construction from Seward to Fairbanks, via Broad Pass, with a branch to the Matanuska coal fields. The conditions at the end of the working season of 1917 were as follows, from the seaboard northwards: The Alaskan Northern, bought by the government, was being rehabilitated from Seward to Knik Creek, 71 miles. Thence northwards work was progressing for 30 miles, blasting out a roadbed along the cliffs facing Turnagain Arm. From this point the road had been completed for 20 miles to Anchorage. This important town, with modern equipments and a population of 5000 or more, is the present base for railway construction. From Anchorage to Montana Creek (in the Susitna watershed) the main-line road was finished and in operation, a distance of 115 miles. From this section, at Matanuska Junction, a branch line of 38 miles terminates at Chickaloon in the Matanuska coal fields: this section was in operation, busy handling coal. Beyond Montana Creek clearing and grading, in various stages, was done as far as Indian Creek, mile 270. Thence through Broad Pass to the Nenana coal field, mile 360, only surveys had been made. Beyond the coal field to the town of Nenana (the base of construction in the interior), mile 414, grading of part and the completion of 10 miles of road had been effected. Thence to Happy Station, mile 460, there had been surveys only. At this point the junction was made with the Tanana Valley Railroad, bought by the government, a narrow-gauge road of 39 miles, which reached from Fairbanks the goldfield of the district at Chitina, and also the town of Chena on the Tanana River. It seemed possible that the road might reach the Tanana Valley by the autumn of 1918, but it was reasonably certain that the entire system would be in operation by the summer of 1919.

**SURVEYS.** To include the fiscal year 1916-17 the U. S. Geological Survey made geological surveys covering 177,963 sq. mi., 30.2 per cent of the territorial area, divided as follows: exploratory, 73,200; reconnaissance, 99,535; detailed, 5232. Their topographical surveys aggregated 202,391 sq. mi., as follows: exploratory, 51,680; reconnaissance, 146,983; detailed, 3731, covering 34.6 per cent of Alaska. The U. S. Coast Survey continued its surveys of the waters of the territory, principally in the southeastern part. Many townsites in the regions adjacent to the U. S. railroad were surveyed by the General Land Office, and opened for settlers.

**COAL.** The progress of this industry has been disappointingly slow, and liberal modifications of the present national laws have been recommended as essential to its proper development. Against a few thousand tons of coal mined locally, there were imported into Alaska during the nine months ending with September, 1917, 45,996 tons of coal, largely from foreign mines. In the Matanuska district the United States had purchased one mine and was opening another, from which about 100 tons were furnished daily in the summer season, to the government railroad principally. Three leases only were made

in the Matanuska district, covering 3440 acres. In the Bering River field private enterprise was developing the coal of patented lands, and was building a railroad to handle the output.

**PETROLEUM.** The Alaskan product is a high-grade refining oil with paraffin base. All wells are shallow and necessarily pumped, and their development is possible only through drilling. The restrictions placed on operators since the withdrawal of those lands in 1910 are such as to deter operation. See **MINERAL PRODUCTION.**

**AGRICULTURE.** The railway construction has been followed by the opening of many farms in the valley of the Susitna and adjacent regions. The economic advantages of agricultural industries had already been proved by farmers in the valleys of the Tanana and the lower Yukon, as well as in the Lynn Canal country. Difficulties and slowness of transportation to markets are the worst drawbacks to the farming interests. The potato yield of central Alaska during 1917 was sufficient to care for local needs, and to meet the demands of the northwestern sections of the Territory.

**FORESTS.** During the fiscal year 1916-17 the receipts from the products of the national forests of Tongass and Chugach amounted to \$86,718, and the expenses of administration to \$45,770. In these forests there were patented 41 homesteads, with others in preparation: 125 applications were received during the year. Occupancy permits to the number of 643 were in effect. Of lumber in 1916, 9,141,000 board feet measurement, and in 1917, 7,358,000 feet were produced.

**TELEGRAPHS.** Except in the Koyukuk Valley, practically every settlement of importance was connected with the outside world by telegraph, aerial, submarine, or wireless. The main cable between Seattle and Sitka being often interrupted by currents and rocky bottoms, its replacement was contemplated. Cable rates were again reduced and the night-letter system adopted.

**AIDS TO NAVIGATION.** The Lighthouse Bureau added during the year 1917 eleven lights, one fog-signal, twenty-three buoys, and seven beacons. See **LIGHTHOUSES.**

**MAILS.** The winter service from the coasts is strictly limited as to weight, and little beyond first-class matter is carried.

**CONGRESSIONAL LEGISLATION.** The following are the principal laws passed by Congress during the fiscal year 1916-17, regarding Alaskan affairs: Prohibiting on and after January 1, 1918, the manufacture, sale, gift, or other disposal of intoxicating liquors or alcohol; establishing the Mt. McKinley National Park; authorizing the legislature of Alaska to establish and maintain schools; and authorizing the issue of arms and military equipments to the home guard.

**U. S. TAXES AND THE ALASKAN FUND.** The amount collected by the Federal courts on account of taxes levied by the United States on licenses and business in the incorporated towns aggregated \$175,000, an increase of \$6000 over the previous year. In addition, Federal revenue of a considerable amount was collected from the national tax on the salmon industry. The territorial act passed during the session of 1917 also levied taxes on the fishery products; the legality of this was questioned.

The Alaska Fund for 1917 amounted to \$259.

370, an increase of \$10,000 over that of 1916. This fund was utilized as follows: 65 per cent for the construction and maintenance of roads and trails outside of towns; 25 per cent for support of schools in districts outside of the incorporated towns; and 10 per cent for the care of indigents. The old settlers are cared for in the Pioneer Home at Sitka, and the indigent insane are provided for temporarily within Alaska and permanently in a sanitarium at Portland, Oregon. See MINERAL PRODUCTION.

**ALBANIA.** Nominally an independent principality, Albania was reduced to an anomalous condition in the great war, being overrun in one part or another by Austrian, Bulgarian, Italian, and Greek forces. The country comprises the former Turkish vilayets of Scutari and Janina and parts of Kossovo and Monastir. Its independence was proclaimed at Valona, November 28, 1912, and on December 20 the principle of Albanian autonomy was agreed to by the London Ambassadorial Conference. The Conference subsequently determined approximate frontiers and decided that the country should be administered by some European prince. On February 23, 1914, William of Wied, a German prince, accepted from an Albanian delegation the headship of the government, and on March 13, at Durazzo, formally became prince (mpret) of Albania. He had the support and advice of an International Commission of Control in accordance with an agreement of the Ambassadorial Conference. Turbulent conditions followed the outbreak of the great war, and in September, 1914, the prince and most of the members of the International Commission left the country. An unsuccessful attempt was made by Essad Pasha, in September and early October, 1914, to establish a republican government at Durazzo, and early in 1916 Prince William returned, but was unable to set up an orderly government.

The approximate frontiers of Albania embraced about 10,800 square miles. The estimated population, which is largely in the southern part was about 850,000, of which about 590,000 Mohammedan, 140,000 Greek Orthodox, and 120,000 Roman Catholic. The town of Scutari had an estimated population of 35,000; Elbasan, 13,000; Argyrocastron (now in Greek territory), 12,000; Tirana, 12,000; Berat, 8500; Koritsa, 8000; Valona, 6500; Durazzo, 5000. See EPIRUS.

**HISTORY.** After the fall of Montenegro, the Central Powers took over the whole of Albania with the exception of the southern portion below Valona. In March, Austria-Hungary declared the region a self-governing province under Austrian protection. On April 20, it was announced that the French had proclaimed the independence of Albania and had set up an authority in the region of Goritza in which half of the officers were natives. The southern portion, which had fallen into the hands of the Italians, was still held by them and on June 3 they declared it an autonomous province under Italian protection. Later (June 19) the Italian foreign office declared that Italy wished only to annex Valona and that the rest of the country could choose its own government under Italian protection. The Italian expeditionary force which had entered southern Albania under the command of General Piacentini widened its lines to the east till they touched the left

wing of the Allied army in Macedonia, and to the south, where Janina was occupied against the protests of Greece. It was reported on July 19 that the Albanian leaders had requested Italy to demand for them at the Balkan conference Epirus and a part of Serbia.

**ALBERTA.** One of the Northwest, or Prairie, provinces of Canada. It lies east of British Columbia and west of Saskatchewan and is bounded on the south by the United States. The area is stated at 255,285 square miles, which is a very little larger than California and Oregon combined. The population continued to increase rapidly after 1911 (374,663), many persons being attracted by the extensive grain-growing lands. Census of June 1, 1916, shows total population of 496,525 (277,256 males, 219,269 females). The city of Calgary had in 1916, 56,514 inhabitants; Edmonton, the capital, 53,846.

The province has a legislative assembly of one chamber; it consists of fifty-six members elected by direct vote for five years. The executive authority rests with a lieutenant governor, appointed by the governor-general of the Dominion; he acts through an executive council, or responsible ministry, of eight members. Lieutenant governor in 1917, Robert George Brett; premier, A. L. Sifton. See CANADA.

**ALCOHOL.** See LIQUORS.

**ALFALFA.** The hay produced from this crop in the United States constituted from 15 to 20 per cent of the total hay production. The area devoted to alfalfa continued to increase during the past year and was regarded as consisting of over 6,000,000 acres. Special stress was laid in many States on the increase of the alfalfa acreage in the effort to produce greater supplies of food and feeding stuffs to meet the demands of the war emergency. While the culture of the crop was rapidly increasing and had spread to all parts of the country, 75 per cent of the yield was produced in the north central States west of the Mississippi River and the Rocky Mountain and far western States. The leading alfalfa states in decreasing order of production were Nebraska, Kansas, California, and Colorado. Nebraska and Kansas produced about 25 per cent of the country's yield, and the four States together about 40 per cent. Alfalfa appears as preëminently the great forage and hay crop of the semiarid sections of the country, where it is grown with and without irrigation.

The average prices for alfalfa seed in 1917 were from 30 to 40 cents higher per bushel than in 1916. The average price as sold by producers was \$9.04 and as bought by them \$11. The seed crop of Kansas, one of the principal seed-producing States, was only about 50 per cent of the yield in 1916 and was also lower in quality, the shrinkage which is normally about 10 per cent being 20 to 25 per cent. During the year ending June 30, 1917, the imports of alfalfa seed amounted to 3,169,600 pounds, as compared with 3,251,796 pounds the year before. The average farm value of alfalfa hay on October 15, 1917, was \$17.59, while on October 15, 1916, it was only \$10.25 per ton.

The agricultural experiment stations continued to study and add to our knowledge of handling and using the crop. In testing alfalfa as an orchard crop the Oregon Experiment Station found that when the soil is properly irrigated and sufficient moisture maintained in it, the

trees will improve in vigor by growing alfalfa or clover in the orchard. The station also found that as the sulphur requirements of the plant are comparatively high, its response to calcium sulphate, or land plaster, and flowers of sulphur used as fertilizers was very satisfactory. The Nebraska Station demonstrated that alfalfa is the best forage crop for the sandhill regions. The Province of Ontario, Canada, reported an area of 189,109 acres in alfalfa in 1917, or an increase of about 12,000 acres over 1916.

**ALGARROTIN.** See **CHEMISTRY, INDUSTRIAL.**

**ALGERIA.** One of the Barbary States of northern Africa; a French province, administered by a governor-general assisted by a consultative council. The country is divided into the three departments of Oran, Constantine, and Algiers, with capital cities of the same names, each sending one senator and two deputies to the National Assembly.

Area by departments, European and native population (1911 census), and total density per square kilometre, are shown below:

Department	Sq. kms.	Europeans	Natives	D.
Algiers .....	54,540	271,787	1,421,819	81
Constantine ...	87,302	155,654	1,945,443	24
Oran .....	65,897	319,089	892,212	19
Algeria proper..	207,739	746,510	4,740,526	24
Southern Territories .....	367,550	5,533	481,052	1
Total .....	575,289 *	752,043	4,740,526	10

\* 222,119 square miles.

The products of the country include esparto and halfa grass, barley, wine, oil, tobacco, wool, iron, and zinc ores, etc. Workable beds of phosphates have been discovered in the region between Oran and Tunis. The exports consist mainly of wine, wheat and other cereals, sheep and oxen, skins, fruits, zinc and iron ores, olive oil, phosphates, cork wood, esparto grass, manufactured tobacco, and vegetables. The French forces maintained in Algeria consist of an army corps numbering 54,600 men, and the expenditure for military and naval purposes is borne by France.

In the table below will be found the area devoted to principal cereal crops for two years, with the total yield, and the average yield per hectare in 1916 (1917 figures are provisional):

	Hectares		Quintals		Qs. ha.
	1917	1916	1917	1916	
Wheat .....	1,803,821	1,324,328	8,087,000	7,933,785	6.0
Barley .....	1,148,794	1,217,798	7,230,000	7,831,498	6.4
Oats .....	275,942	216,762	2,750,000	1,907,339	4.5
Vines .....	148,956	177,475	.....	8,781,266 *	..

\* Hectoliters.

From the department of Oran came the report that the 1917 harvest was rendered difficult by extensive lodging of wheat and barley; complaint was made of a shortage of labor and coal, and threshing was delayed and prolonged.

**COMMERCE.** The table below shows the imports for consumption and exports of domestic produce in thousands of francs:

	1908	1909	1910	1915	1916
Imports ..	449,300	462,000	512,000	472,844	538,680
Exports ..	319,200	359,200	518,000	512,808	538,680

The leading imports for consumption and exports of domestic produce are shown below for 1916, values in thousands of francs:

Imports	1916	Exports	1916
Cottons .....	89,168	Sheep .....	32,047
Woolens .....	2,184	Hides & skins..	9,158
Clothing and linen .....	20,708	Wool .....	11,395
Skins and mfrs..	19,695	Wheat .....	23,689
Machinery and parts .....	11,743	Oats .....	24,816
Other metal work .....	10,276	Barley .....	34,117
Furniture and woodwork .....	17,440	Olive oil.....	11,071
Toys, brushes, etc. ....	6,307	Cork .....	6,659
Paper, etc.....	22,751	Wine .....	259,584
Coal .....	19,548	Phosphates ....	9,505
Sugar .....	21,874	Iron ore.....	13,330
Vegetable oils..	5,635	Zinc ore.....	7,244
Iron & steel....	7,094	Fruit .....	17,333
Coffee .....	14,887	Tobacco, etc...	22,279

**FINANCE, ETC.** The following table gives details of the 1916 budget:

Revenue	Francs
Taxes (direct) .....	13,775,046
Taxes (indirect) .....	59,676,195
State domains .....	10,198,645
Monopolies, etc. ....	10,496,319
Various .....	6,253,198
Receipts d'ordres .....	26,079,849
Extraordinary .....	2,697,233
Special revenue.....	1,226,000
Total .....	130,402,535

A governor-general administers the country, assisted by a consultative council. Legislative power rests with the French chambers; each department sends a senator and two deputies to the National Assembly.

**ALLEGHENY COLLEGE.** Situated at Meadville, Pa. Students in the fall of 1917

numbered 352 and there were 26 members of the faculty. Volumes in library, 44,000. Productive funds, \$1,025,595, with total income of \$174,791. Founded in 1815. Non-sectarian in policy but under Methodist Episcopal control. Co-educational. President, William Henry Crawford, D.D., LL.D.

**ALLEN, JOHN.** An American legislator, long widely known as "Private" John Allen, died at Tupelo, Miss., October 30, 1917. He was born in Tishomingo County, Miss., July 8, 1846, received a public school education and at the outbreak of the Civil War enlisted in

the Confederate Army. After the war he studied law, was admitted to the bar in 1870, was district attorney of the First Judicial District of Mississippi in 1876-80, and in 1885-1901 represented the First Mississippi District in Congress. Allen gained his name of "Private" from the fact that early in his career in Congress he announced that in view of the prodigious number of generals, colonels, and majors who survived the Civil War, he aspired to the distinction of being known as a private soldier. He was noted for his witty, incisive speeches.

**ALLENBY, Sir EDMUND HENRY HYNMAN.** A British soldier, distinguished as a commander on the Western Front and for his campaign in Palestine, resulting in the capture of Jerusalem. He was born April 23, 1861, was educated at Haileyburg and soon afterward joined the Inniskilling Dragoons, serving with that regiment in the Bechuanaland Expedition, 1884-85. He was afterward with the British force in Zululand, 1888; was adjutant of the Inniskilling Dragoons, 1889-93; took part in the South African War with distinction; commanded the Fifth Royal Irish Lancers, 1902-05, and the Fourth Cavalry Brigade, 1905-10. After the opening of the European War Allenby showed marked efficiency both as division and corp commander and later as commander of the British Third Army, his skill contributing largely to the great victories of the Somme and the Aisne. In June, 1917, he was sent to take command of the expedition in Palestine, succeeding General Murray. He steadily advanced until the Turks were compelled to retreat on Hebron and Jerusalem, the latter city surrendering on December 10. Allenby, at the head of the British forces and allied contingents and military representatives, entered the Holy City quietly on December 11. In 1916 he was made lieutenant general. See WAR OF THE NATIONS.

**ALLIANCE FRANÇAISE, FÉDÉRATION DE L.** An association of societies in the United States and Canada, incorporated in 1902. It aims to promote the study of the French language, literature, arts, and history. A council which meets five times a year and which is composed of twenty directors, supervises the affairs of the Federation. A circulating library is maintained. The honorary president of the Federation is M. Jusserand, French ambassador at Washington. The president of the administrative council is M. J. LeRoy White, and the general secretary is Dr. Louis Delamarre. There are 185 groups or circles in different cities of the United States and Canada and delegates are sent to an annual convention, the last convention having been held in New York in April, 1917.

**ALSACE-LORRRAINE.** The Imperial territory, or Reichsland, of Germany, which was taken from France in 1871, and for whose recovery she contends in the present war. The territory consists of Lorraine and Upper and Lower Alsace. The territory is bounded on the north by Luxembourg, the Rhine Province of Prussia, and the Palatinate (Rhenish Bavaria); the eastern boundary, which is wholly Alsatian, is marked by the Rhine River, separating the territory from Baden; at the south, Upper Alsace touches Switzerland; on the west is France. The area of the territory is 14,522

square kilometres (5607 square miles), or nearly the area of Connecticut and Rhode Island. The population increased from 1,549,738 (106.8 per sq. km.) in 1871 to 1,874,014 (129.0 per sq. km.) in 1910. Below are shown the area by districts and the population according to the census of December 1, 1910:

	Sq. km.	Population		
		Male	Female	Total
Lorraine .....	6,228	356,026	299,185	655,911
Lower Alsace .	4,786	352,644	348,294	700,938
Upper Alsace ..	3,508	256,955	260,910	517,865
Total ....	14,522	965,625	908,389	1,874,014

The 1910 census returned the German-speaking population at 1,624,260; French-speaking, 204,262. German is the language of the schools, and hence large numbers of the people who favor reunion with France are unlearned in the language of that country. In 1910 Roman Catholics numbered 1,428,343 (76.22 per cent); Evangelical, 408,274 (21.78 per cent); other Christians, 3868 (0.21 per cent); Jews, 30,483 (1.63 per cent). The population residing in communes of 2000 and upwards in 1910 was 996,149 (53.16 per cent); in rural communes, 877,865 (46.84 per cent). The larger communal populations in 1910 were as follows (in some cases the figures include the population of areas subsequently annexed): Strassburg, in Alsace, capital of Alsace-Lorraine, 178,891; Mülhausen, in Alsace, 105,488; Metz, in Lorraine, 79,318; Colmar, in Alsace, 43,808; Haguenau, in Alsace, 18,868; Saargemünde, in Lorraine, 15,384; Diedenhofen (Thionville), in Lorraine, 14,184. In 1913 marriages numbered 13,170 (rate per thousand inhabitants, 6.9); total births, 45,614 (23.9); living births, 44,341 (23.3); deaths, including stillbirths, 30,501 (15.8); excess of births over deaths, 15,113 (7.9). Stillbirths numbered 1273 (2.8 per cent); illegitimate births, 3409 (7.5 per cent).

For principal crops the figures below show the area in hectares and the yield in metric quintals in 1914, and the average yield per hectare in the period 1904-13 and the year 1914:

	1914		Average	
	Hectares	Quintals	1904-13	1914
Wheat .....	134,925	1,823,330	15.5	18.5
Rye .....	56,196	772,370	18.9	18.8
Barley .....	47,482	883,670	19.3	18.6
Oats .....	112,405	1,911,980	16.9	17.0
Potatoes .....	92,211	8,731,510	114.6	94.7
Hay .....	197,481	11,559,050	49.0	58.5

Alsace-Lorraine is administered, under the sovereignty of the Emperor, by a governor (Statthalter) whom the Emperor appoints and may recall. Under the constitution of May 31, 1911, the legislative power is vested in the Emperor and a diet of two chambers. The first chamber consists of representatives of the religious bodies, of the four larger cities, of chambers of commerce, etc., and of members nominated by the Emperor, all holding office for five years. Members of the second chamber, 60 in number, are elected by direct vote for five years.

In November, 1917, the ex-mayor of Colmar (Alsace), who had escaped to the United States, scouted the idea of a plebiscite as being

a fair means of determining the future status of Alsace-Lorraine. At an election under German supervision a vote would be only another "scrap of paper." "Alsace," the ex-mayor said, "is French to the heart to-day, and since 1871 she has never forgotten her loyalty to the free republic to which her soul belongs. German editors write editorials full of learning to show that the children of Alsace-Lorraine to-day are different from yesterday, because they speak the language which Berlin has forced upon them. . . . Do you know how many Alsace-Lorrainers deserted from the German Army when war broke out and are now fighting with France? Thirty thousand. . . . German papers will tell you that because we speak the language that has been forced down our throats we are content. That is the thinking of Prussia. But can the Prussian tell us why, while we were a part of France, we never spoke bitterly of the government? Why under . . . German rule we have protested by our representatives at the Reichstag? Why our young men have emigrated to escape military duty, while our citizens innumerable have gone to imprisonment for expressing their affection for France? Despite the mills of industrious Kultur, which strive forever to pour everything into a hideous German mold, Alsace-Lorraine is to-day overwhelmingly French. . . . Our population is 1,900,000 all together. Of those 1,500,000 are natives, almost without exception totally French. . . . Since the beginning of the present war the German Generals have made no hesitation about declaring that they consider Alsace-Lorraine an enemy country. How much better than Belgians have we been in the sight of Prussia? Look at the thousands of Alsace-Lorrainers who have been deported to slavery and answer for yourself. . . . The prisons are full of my people who were arrested during those first awful days of the war. When they are candid—which happens seldom—the Germans admit that they have no faith in the loyalty of Alsace-Lorraine. . . . The martial courts have sought to silence us with frightful grimaces. We have spoken our love for France at the cost of our lives. Executions have been many, and thousands of years of imprisonment have been ordered by their councils of war." See FRANCE, *History*; GERMANY, *History*; WAR OF THE NATIONS.

**ALUMINUM.** See CHEMISTRY, INDUSTRIAL.

**AMERICAN ASSOCIATIONS AND SOCIETIES.** For organizations of which the official titles begin with the word American, see under the specifically descriptive word in that title.

**AMERICAN INTERNATIONAL CORPORATION.** This corporation was formed in November, 1915, by prominent bankers and financiers, especially those connected with the National City Bank of New York, for the purpose of developing American trade and industrial interests abroad. Its charter enables it to carry on every kind of trade, manufacturing, construction, or financial activity through the numerous branches of the National City Bank and the agencies of American corporations doing business abroad. The corporation has undertaken developmental activities in various European countries throughout South and Central America, China and Japan, and in various parts of the United States. In September it organized the American International Steel Corpora-

tion to act as agent for the sale of American steel products abroad, with offices and salesmen in Europe, Asia, South America, and Africa. While the war-time business in steel and iron goods for export was small owing to the precedence of government business, this organization was expected to play an important part in the after-war development of American trade.

The corporation also entered into a contract with the United States government to construct an extensive shipyard on Hog Island in the Delaware River, and to build 50 steel merchant ships of 7500 tons each. The government received the privilege of increasing the order to 200 ships. To handle this business a subsidiary called the American International Shipbuilding Corporation was formed. Still another subsidiary, the New York Shipbuilding Corporation, also handling large government contracts, had extensive works at Camden, N. J. The above contract provided that after a fixed percentage of profit had been subtracted all additional profits should be divided equally between the government, the working force, and the contracting corporation.

Another expansion was the acquisition in November of G. Amsinck and Company of New York, commission traders, founded in 1856, and operating mainly in Latin America. About the same time the National City Bank opened its tenth foreign branch at Caracas, Venezuela, this being the eighth branch in South America.

**AMERICAN UNIVERSITY UNION IN EUROPE.** An association of American universities and colleges organized to meet the needs of their students and graduates in Europe for military or other service in the Great War in the cause of the Allies. Headquarters in Paris are at the Royal Palace Hotel on the Place du Théâtre Français and the Hotel Montana. Headquarters in London are at 16 Pall Mall East, S. W., 1, near Cockspur Street and Haymarket. The Union provides a home with the privileges of a simple club, such as information bureau, writing and newspaper room, bedrooms, baths, social features, opportunities for physical recreation, entertainments, medical advice, etc. The institutions cooperating with the Union are privileged to conduct separate bureaus in headquarters for the interest of the respective member institutions.

At the end of 1917 the following colleges and universities were members: Allegheny, Amherst, Beloit, Boston, Bowdoin, Brooklyn Polytechnic Institute, Brown, California, Carleton, Carnegie Institute of Technology, Catholic University of America, Chicago, Cincinnati, Clark University, Colby, Colgate, Colorado, Colorado State Teachers' College, Columbia, Cornell, Dartmouth, Delaware, Denison, George Peabody College for Teachers, Georgetown, George Washington, Georgia, Grinnell, Harvard, Haverford, Hobart, Holy Cross, Idaho, Illinois, Indiana, Iowa State University, Johns Hopkins, Kentucky, Knox, Lafayette, Lehigh, Leland Stanford, Louisiana, Maine, Massachusetts Institute of Technology, Michigan, Michigan Agricultural College, Minnesota, Michigan College of Mines, Missouri.

**AMHERST COLLEGE.** Situated at Amherst, Mass. Students in the fall of 1917 numbered 368, and there were 56 members of the faculty. Volumes in library, 115,000. Productive funds, \$3,000,000; income, \$150,-

000. Dr. Albert Parker Fitch, former president of Hudson Theological Seminary, is now professor of history of religion and biblical literature. Founded in 1831. Non-sectarian. President, Alexander Meiklejohn, Ph.D., LL.D.

**AMMONIUM SULPHATE.** See FERTILIZERS.

**AMMUNITION.** See MILITARY PROGRESS.

**AMUNDSEN EXPEDITION.** See POLAR RESEARCH.

**ANALYTICAL CHEMISTRY.** See CHEMISTRY, GENERAL PROGRESS OF.

**ANDERSON, WINSLOW.** An American surgeon and medical educator and editor, died in New York City May 7, 1917. He was born in 1861. After graduating M.D. from the University of California in 1884, he spent some years in London, where he became a member of the Royal College of Physicians and the Royal College of Surgeons. From 1896 to 1911, when he retired as emeritus professor, he held the chair of gynecology and abdominal surgery in the College of Physicians and Surgeons, San Francisco. Dr. Anderson became surgeon to several hospitals, was for some years a member of the California State Board of Health and the Board of Medical Examiners, and surgeon general of the National Guard. From 1890 he edited the *Pacific Medical Journal*. He wrote *Mineral Springs and Health Resorts of California*, and articles on diseases of the lungs in *The Twentieth Century Practice of Medicine*. He served as a president of the American Medical Editors' Association, and was identified with many societies, American and foreign.

**ANDREWS, ELISHA BENJAMIN.** An American educator, died at Interlaken, Fla., October 30, 1917. He was born at Hinsdale, N. H., January 10, 1844, and was educated at the public schools and privately. At the outbreak of the Civil War he enlisted and served in Connecticut regiments during the war. Graduating at Brown University in 1870 and at the Newton Theological Institution four years later, he preached for a year and afterward was president of Denison University in 1875-79. He was professor of homiletics at Newton Theological Institution, 1879-82; professor of history and political economy in Brown University, 1882-88; professor of political economy and finance in Cornell University, 1888-89; and president of Brown University, 1889-98. Because the trustees of that university criticized his advocacy of free silver he resigned in 1897 but soon withdrew his resignation. In 1898-1900 he was superintendent of schools at Chicago, and then was appointed chancellor of the University of Nebraska. He was United States commissioner to the Brussels monetary conference in 1892, where he vigorously advocated international bimetalism. He was elected a member of the corporation of Brown University in 1900 and in 1904 became president of the Association of State Universities. Dr. Andrews retired from the University of Nebraska as chancellor emeritus January 1, 1909. In 1907 he received a pension from the Carnegie Foundation. Besides a number of college text books on history and economics he published: *An Honest Dollar* (1889; 3rd ed., 1894); *Wealth and Moral Law* (1894); *History of the United States* (2 vols., 1894); and *The History of the Last Quarter Century in the United States, 1870-95* (1896), revised under the title *The United States in Our Own Time* (1903).

**ANGLICAN CHURCH.** See ENGLAND, CHURCH OF.

**ANGOLA.** A West African Portuguese colony, with an estimated area of about 490,000 square miles, and a population estimated at 4,200,000. St. Paul de Loanda is the capital. Tropical agricultural products are exported, but the rubber supply is failing. The trade is mainly with Portugal. In 1914 the imports were valued at 5,214,487, and the exports at 4,347,237 escudos (exclusive of Congo). Revenue and expenditure for 1916-17 balanced at 6,835,288 escudos. Total length of railway lines open for traffic in 1916, 818 miles. The colony is administered by a governor-general.

**ANNAM.** A French protectorate on the China Sea; a part of the dependency of French Indo-China (q.v.). Hué is the capital, with 65,000 inhabitants, and Bin-Dinh the largest town (75,000). The trade is included with that of French Indo-China. Raw silk, cattle, and agricultural and forest products are exported. There are valuable mineral deposits, but mining is not well developed. The native king (Khaidinh, who succeeded Duy-Tan in 1916) is the nominal head of the government. Internal affairs are actually administered by the French residents.

**ANORTHOSITE.** See GEOLOGY.

**ANTARCTIC EXPEDITIONS.** See POLAR RESEARCH.

**ANTHRAX.** An apparently effectual and simple cure for anthrax (malignant pustule) in human beings was announced by R. Kraus, head of the bacteriologic institute of the national department of health of Argentina. Anthrax had flourished in that country of late years, owing to its cattle and hide industries, and had caused more severe suffering there than in any other country in the world. Statistics showed that there had been a notable increase in the number of cases occurring in the United States recently, so that the disease was coming to be recognized as an important occupational malady. While anthrax was not nearly so fatal as was generally believed, the mortality ranged from 13 to 24 per cent. Kraus's treatment consisted in the injection, intravenously, subcutaneously, or intramuscularly, of normal beef serum. The fifty cases treated in this manner and reported by Penna and Krause, all recovered promptly. The dose was 20 to 30 c.c. or even larger, the serum being heated twice for half-hour periods to 56 degrees C. before being injected. Later reports covered ninety cases with only one death. The problem of eradicating anthrax from the United States was only to be solved by careful inspection and disinfection of hides, wool, and other animal products shipped from localities known to be infected with anthrax spores, which are peculiarly resistant to drying, and maintain their infective potency for long periods. Until more stringent methods were adopted it seemed likely that the number of cases of malignant pustule in the United States would continue to show a steady increase.

**ANTHROPOLOGY.** Contrary to what might have been expected, the anthropological harvest of 1917 has been an unusually productive one, at least in America. The editors of the *American Anthropological Association*, by throwing open the pages of their quarterly journal and memoirs to foreign scholars, have also done something to provide European writers with an

opportunity to publish during the war and are thus promoting the interests of international scientific coöperation. The launching of two promising new serial publications, the *International Journal of American Linguistics* and the *Harvard African Studies* (see *Africa* below) is likewise a noteworthy phenomenon.

**THEORETICAL ETHNOLOGY.** An attempt to summarize the present ethnological viewpoint as regards the relations of ethnology to psychology, racial characteristics, and geographical environment is made by Lowie in his *Culture and Ethnology*. The general position of this work coincides roughly with that emphatically voiced by Kroeber in his paper on "The Superorganic" (*American Anthropologist*, 1917, pp. 163-213), the contention of both writers being that the domain of culture constitutes a distinct sphere of investigation, from which follows the complete autonomy of ethnology and the necessity of interpreting the data of civilization through other facts of a cultural character rather than by merging them in data of a supposedly more general nature. This is likewise the view taken by Rivers in his "Sociology and Psychology" (*The Sociological Review*, vol. IX), where the author shows that psychology is rather in need of ethnological aid than vice versa.

The passage at arms between Professor Elliot Smith and several American ethnologists as to the derivation of American civilizations from an external source has been followed by a lull. On the other hand, the problems of social organization and kinship maintain their reputation for perennial attractiveness. In his "California Kinship Systems" (*Univ. of Cal. Pub.*, vol. XII, No. 9) Kroeber once more defines his opinions on the place of ethnology in a scheme of the sciences and defines his position on the development of kinship nomenclature. Ethnology, he contends, does not seek to establish causal relations but merely to describe cultural phenomena. With regard to relationship terms in particular, it is "the infinitely variable play of the variable factors" that precludes the determination of regular causal connections. While sociological causes have certainly been at work, as Kroeber now explicitly admits, there are more potent influences of the "psychological" order, such as operate in the extension and application of other elements of human speech. Accordingly it is not admissible to argue from an observed feature of terminology to a sociological cause. In other words, stages of human society cannot be reconstructed from the kinship nomenclature after the manner of Lewis H. Morgan and W. H. R. Rivers. From a different angle the same subject is dealt with in Lowie's paper on "Historical and Sociological Interpretations of Kinship Terminologies" (*Holmes Anniversary Volume*, pp. 293-300). Lowie points out that the distribution of kinship features is such as to be in large measure intelligible only through borrowing. In other words, often the features cannot be the result of a direct reflection of existing social conditions but occur in a definite tribe because of its geographical position and historical relations. Sociological causes may be involved where similar phenomena of nomenclature appear in historically unconnected regions. In a chapter of his *Culture and Ethnology* this author likewise emphasizes the importance of the distributional aspect

of the kinship problem. He further insists that the kinship terminology of a people cannot be regarded as a system but as a congeries of often disparate principles of classification welded together by historical rather than logical causes. In a memoir on *Matrilineal Kinship, and the Question of its Priority* E. S. Hartland boldly throws down the gauntlet to American ethnologists in general and Swanton and Lowie in particular, for challenging the greater antiquity of maternal descent and once more breaks a lance for the classical theory, citing mainly African, American, and Australian data on behalf of his thesis. With regard to the New World Hartland repudiates the argument commonly advanced by American scholars, viz., the higher cultural stage of the matrilineally as compared with patrilineally organized tribes, on the ground that a people may progress in the material arts and industries while preserving a primitive social polity. He contends further that where no traces of totemic culture with exogamy and mother-right are now discernible in America, this is merely due to the combined disturbing influences of aboriginal wars and migrations, missionary teaching, and governmental interference. As to the possibility of a loose organization among primitive peoples, Hartland insists that while a few savage peoples, such as the Eskimo and Andamanese, trace their descent through both parents, the preponderating majority of savage peoples limit kinship to one or the other side of the family and that this unilateral scheme must be regarded as normal. Great weight is attached to the exceptional position of the maternal uncle in some patrilineal tribes, this being uniformly interpreted as a relic of an earlier matrilineal condition. For Australia Hartland argues that an early dual organization was followed by a subdivision into four matrimonial classes; and he concludes that the patrilineal system with eight classes found in Central Australia represents a still later stage of social evolution.

Hartland's reopening of a question almost considered closed by Americanists is sure to precipitate a lively controversy. It is worth noting that a fellow-Briton, W. H. R. Rivers, so far from sharing Hartland's views rejects the argument in its generality, partly on the basis of the empirical evidence adduced from the New World, partly on account of the important changes wrought in social organization by the contact of different populations (article "Mother-right" in Hastings's *Encyclopædia of Religion and Ethics*).

A contribution of the greatest significance for the general problem of animal domestication from an ethnological point of view has been made by Laufer in his memoir on *The Reindeer and its Domestication*. Compared with other animals the reindeer is the most recent to be domesticated. There is no record of its use by man except as game in the classical writers, and the earliest mention of its domestication is to be found in a Chinese source going back to 499 A.D., at which time it is clear that the animal was both milked and employed for draught. Allowing for the gradual process of taming, its initial stages may safely be traced to the beginnings of the Christian era. The Chinese reference antedates by centuries the earliest Western account, derived from the narrative of a Norse traveler to northeastern Eu-

rope, whose story at best suggests the very first stage of domestication. Mention of fully domesticated reindeer do not appear in Europe earlier than the fifteenth century; the negative evidence of the *Kalevala*, the great Finnish epic, is especially noteworthy. It is thus clear that the starting-point of reindeer culture must be looked for on Asiatic soil, while the great uniformity in relevant customs, such as castration by biting, property-marketing, milking, and lassoing, clearly demonstrates a single origin.

In determining this centre of distribution Laufer rules out tribes like the Chukchi, whose herds are still in a half-wild condition, and others like the Yakut, among whom reindeer play a wholly secondary part. Since the entire reindeer culture is patterned on the domestication of other species tamed at an earlier date, its evolution must be traced to some area where reindeer are found under domestication with such other animals as horses and cattle. These conditions are satisfied in the vicinity of Lake Baikal,—precisely the region to which the oldest Chinese records refer. Of the present populations inhabiting this region the Buryat are out of the question as reindeer tamers because no member of the Mongolic stock ever had reindeer. The Tungus are known to be newcomers in Siberia and historical annals show their ignorance of reindeer prior to their immigration. There remains the new Turkicized remnants of originally Samoyed peoples living in the Sayan mountains and the upper reaches of the Yenisei. Of these the Soyot, some of whose gentile names still coincide with those of the Samoyed, are especially noteworthy as occupying approximately the old home of the Samoyedic stock. With them the domestication of reindeer has advanced further than among any other Asiatic people while it is certain that the reindeer vocabulary of the Samoyed is remarkably well developed. From this Laufer concludes that the Samoyed while dwelling in the Lake Baikal territory, domesticated the reindeer, transmitting their novel acquisition eastward to the Tungusians, whence in turn it was communicated to the Yakut, Chukchi and Koryak, while in the opposite direction it traveled to the Ugrians of the Ural and the Lapps. As to the process of domestication Laufer points out that single specimens of Cervidae have been tamed in various parts of the world and proved extremely adaptable and that domesticated individuals are commonly employed by primitive men to decoy wild members of their species. It remains an open question whether the practice of riding on reindeer was evolved by the Tungus or by the Southern Samoyed, of whom the Soyot still employ these animals as mounts.

ASIA. Weighty conclusions bearing on the general history of culture are embodied in B. Laufer's *The Beginnings of Porcelain in China*. Taking for his starting-point certain specimens of earthenware agreeing closely with mortuary Han pottery but differing by virtue of their "porcelaneous" glaze, he had fragments subjected to a chemical analysis. This established the identity in chemical composition of this ware with good porcelain, the difference being thus reduced to a purely physical one: the porosity of the Han pieces owing to the use of too coarsely ground material. This indicates that we have here the initial stage in the evolution of genuine porcelain, which developed by grad-

ual improvements until true white porcelain resulted some time in the seventh century of our era. The use of glaze was undoubtedly derived from western Asia during the reign of the Han dynasty, and the particular form of porcelaneous pottery evolved about the close of the third century is the first creative use of the foreign idea by the Chinese artisans, the later steps being purely indigenous. Though some scholars have connected the murrine vessels of classical writers with Chinese porcelain, they antedate porcelain by centuries and must be conceived as highly-glazed pieces of Iranian or Egyptian provenance. Important ethnological results are reached by Dr. Laufer respecting the character and correlations of the potter's wheel. This device is restricted to the Old World, and there again to ancient Egypt, the Mediterranean and West Asiatic civilizations, Iran, India, China, and the Chinese culture province. In other words, it belongs to the higher levels of civilization, where it is found in association with the use of the plow and ox, and is uniformly used by the male sex, while hand-made pottery throughout the world is almost uniformly a feminine industry. Technologically, it is simply a cart-wheel applied to the ceramic art. The development of pottery is thus unilinear from hand-made to wheel-turned earthenware but involves the grafting of a revolutionary principle upon a process of hoary antiquity; the discrete stages corresponding to a sociological division of labor between the sexes.

A remarkably detailed account of religious thought and observance among the more primitive inhabitants of the Philippine archipelago is offered by Laura W. Benedict in "*A Study of Bagobo Ceremonial, Magic, and Myth*" (*Annals of the New York Academy of Sciences*, vol. XXV, pp. 1-308). The Bagobo, who live in south-eastern Mindanao, have preserved their aboriginal beliefs almost uncontaminated by Mohammedan doctrines. Their pantheon includes deities of exalted rank living in nine heavens from whom neither injury nor succor is expected and who are accordingly not propitiated in any way, their place being in primitive cosmology and literature rather than religion. The assumption is that they are foreign importations. Other gods are intimately connected with human interests and functions as war-gods, nature spirits, and patrons of particular industries. However, even these do not occupy the chief place in aboriginal ritualism, which is reserved for the *buso*, demons preying upon human flesh and causing diseases and innumerable misfortunes. These spirits are consequently prayed to and receive offerings of betel. They have their altars like the benevolent gods but every act of devotion to a *buso* has a purely prophylactic purpose. Every human being is supposed to have an evil soul on the left side, which turns into a *buso* at death, while the right-hand soul is good and departs for a great subterranean country to continue an indefinite existence similar to its earthly career. Among the Bagobo there is no esoteric priesthood, the chief acting as the ecclesiastical headman for his group. However, there are a number of recognized functionaries, such as braves who have honorable slayings to their credit and are permitted to recite their exploits in public; mediums possessed by spirits; and priest-doctors who cure disease or conduct the

séances, drawing replies from the mediums, who are usually of the female sex. In general there is no tendency to exclude women from ritualistic activity. The ceremonies are marked by sacrifices of human victims or fowls, the drinking of sacred liquor, formal purification rites, magical performances to guard against ghosts, chants, and dancing.

The most important results of Miss Benedict's researches lie in her comparative conclusions. Not only are there far-reaching resemblances between the Bagobo and other Mindanao tribes in point of ceremonial procedure, but early Spanish records demonstrate many close similarities with the primitive ancestors of the now civilized Igal and Visayan of other islands. This suggests the probability of a common origin. Other parallels occur in Malacca and various of the East Indian islands, especially in Borneo. But in addition to the Malay basis of Bagobo religion there is very clear evidence of an Indo-Iranian influence in ceremonial technique and still more in mythological conceptions. Thus it appears that the aboriginal stock of myth and ritual was augmented by the infiltration of Hindu elements. Chinese influence was slight and Islam merely introduced some minor magical usages and mythical episodes.

Miss M. A. Czaplicka's *My Year in Siberia*, while only a preliminary account of travels to be more technically described in a later report, furnishes welcome ethnographic data concerning the little-known and isolated Yeniseians sometimes referred to as Ostyak of the Yenisei, though altogether unrelated to the Ostyak proper.

OCEANIA. By far the most intensive study of the social life of any Papuan group as yet published is Dr. Richard Thurnwald's monograph on "Bánaro Society" (*Memoirs of the American Anthropological Association*, vol. III, pt. IV). The Bánaro inhabit four villages on the Keram, a tributary of the Augusta River in northern New Guinea. In every village there are several locally segregated gentes, each subdivided into halves or "sibs." This bifurcation is objectively represented by a corresponding division of the "goblin-hall" which forms the religious centre of every gens. While the patrilineal gens is exogamous, the sib forms the economic unit inasmuch as it owns hunting territories and plantations and has a claim on its members' working power. A unique series of customs is associated with marriage. One basic principle is that two families exchange their daughters, each being espoused by the brother of the equivalent girl. Owing to the intimate relation of the two sibs in a gens, the complementary sibs must participate in the arrangement, which leads to four marriages at the same time. No bridegroom, however, is permitted to have access to his bride, but must turn her over to his father. This elder, instead of exercising marital rights, merely takes her to the goblin-hall, whither he summons a special friend from his own age-group and of the complementary sib; and it is this sib-friend who impersonates the goblin and in this rôle consummates the union. The young husband is not allowed to touch his wife until she has given birth to a child, whose father is supposed to be the goblin. On several subsequent occasions the "goblin-father" reasserts his con-

nubial prerogatives, which he only relinquishes to his son at a later period, whereby an age-mate of the husband comes to share his marital rights. Through this intricate scheme every woman is normally mated by three men,—her father-in-law's age-mate of the complementary sib; her husband; and her husband's age-mate.

Thurnwald connects this peculiarly intricate matrimonial system on the one hand with the exchange of sisters in vogue among numerous Oceanian groups, on the other with the governmental principle by which the elders in the community arrogate to themselves various privileges. Further, describing in detail the kinship terminology of the Bánaro and its relations to other systems, he arrives at the conclusion, independently reached by Rivers, Sternberg, and Lowie, that the Hawaiian type of nomenclature is not earlier than the Turanian as Morgan assumed but represents a later reduction from a more involved type.

AFRICA. The first issue of the *Harvard African Studies* under the editorship of Oric Bates and F. H. Sterns bodes well for the prosecution of Africanist researches in this country. The volume published is a miscellany of papers on archaeological, linguistic, ethnographic, and somatological topics. The longest contribution, by Bates, is devoted to an intensive investigation of the methods and apparatus for fishing employed by the ancient Egyptians. An archaeological discussion by Sterns deprecates the premature identification of African with European artifacts.

The *Journal of American Folk Lore* (vol. XXX, no. 2) devoted one of its quarterly issues largely to African and negro material. Among the contributions made are a series of "Bantu Tales" collected by Rev. R. H. Nassau and numerous negro folk-tales garnered by Mrs. Elsie Clews Parsons in different parts of North America. A unique addition to ethnological literature is Solomon T. Plaatje's collection of *Sechuana Proverbs*, this being the first publication by a member of this South African tribe. Plaatje also appears as collaborator with Daniel Jones in the composition of *A Sechuana Reader in International Phonetic Orthography*. Jones's phonetic researches prove quite definitely that the Bantu as well as the Sudanese languages are characterized by differences in pitch as normal elements of speech.

Mrs. Brenda Z. Seligman (*Man*, XVII, pp. 62-66) points out interesting similarities in "The Relationship Systems of the Nandi, Masai and Thonga." The explanation of the resemblances is found in the common practice of a particular form of marriage,—that between a man and his wife's brother's daughter. This is an observed institution among the Thonga and is inferred for the other two tribes.

AMERICA. The inauguration of a new *International Journal of American Linguistics* has already been mentioned. Under the editorship of Franz Boas and P. E. Goddard, assisted by W. Thalbitzer of Copenhagen and C. Uhlenbeck of Leyden, it is likely to become one of the foremost organs of philological research in the world. As symptomatic of the synthetic tendency so pronounced in recent years may be cited the significant utterance of one of the most competent collaborators, E. Sapir, to the effect that the fifty-seven linguistic families hitherto officially recognized will be ultimately reduced to

not more than about sixteen. On the other hand, a more skeptical attitude is maintained editorially. In his "Introductory" statement Boas explains that while far-reaching morphological resemblances may be based on community of origin the absence of historical data for primitive languages precludes the evidence from becoming demonstrative; what is interpreted by some as the result of an ultimate connection may be due merely to assimilation resulting from contact. Accordingly, Boas regards the minute study of dialectic differentiation as affording a more promising field for research than the quest for remote relationships. He likewise calls attention to the study of literary form as a well-nigh neglected but extremely fruitful task for the linguist. In spite of all methodological warnings the consolidation of languages once reckoned as distinct is progressing merrily, especially in California, where Yuki now remains as the solitary isolated form of speech, all others having been linked with larger groups. In "The Position of Yana in the Hokan Stock" (*Univ. of Cal. Publ. Amer. Arch. and Ethnol.*, vol. XIII, no. 1) E. Sapir defines the characteristics of a language formerly regarded as representing a separate family while it can now be united with Shasta, Pomo, Yuman, Seri, and others under a single head. Its late inclusion is, however, intelligible from its aberrant character, since it is the only Hokan tongue devoid of prefixes and displays an unusual abundance of derivative suffixes. A linguistic contribution of a different order is supplied by P. E. Goddard to whose *Beaver Tails* with interlinear English rendering, there is affixed a series of phonetic tracings secured with the Rousselot apparatus.

An altogether unique publication is Wissler's *The American Indian*. It forms the first attempt to synthesize all available information on the American aborigines, not only ethnologically, but somatologically and archaeologically as well; the inclusion of South America within the scope of the work constitutes an especially noteworthy feature. As regards the question of origins, Wissler supports the accepted view that the Indians of the New World are genetically allied with the Mongoloid race. He conceives a detachment of Mongoloid people migrating into America at the opening of the Neolithic period of Asia, which need not have been altogether contemporaneous with that of Europe. Simpler traits of culture, such as the firedrill and stone technique, were imported from Asia, but the higher civilizational complexes, such as agriculture, pottery, bronze work, and weaving, certainly evolved on American soil.

The present tendency in archaeological research, with its emphasis on the establishment of a definite chronology is well illustrated in U. A. and A. V. Kidder's "Notes on the Pottery of Pecos" (*American Anthropologist*, 1917, pp. 325-360). Here also the working hypothesis is advanced that glazing developed in the Little Colorado region and thence spread to other centres of Southwestern ceramic art. A preliminary report has been published by N. C. Nelson on the "Archæology of Mammoth Cave and Vicinity" (*Proc. National Acad. Sciences*, vol. III, pp. 192-195, March, 1917). Nelson's investigations are significant in that he discovered in Mammoth Cave a deposit of kitchen refuse with remnants of animal bones and shells, bone

and antler implements, crude limestone pestles, but without a trace of either maize or pottery or finer examples of polished stonework. While not geologically ancient, as the faunistic concomitants show, these finds establish a very primitive culture that must be considered antecedent to the Moundbuilder civilization of this area. A relatively later stage in the development of this latter culture seems to be represented at a site about three miles away in an airline, where a thin layer of ashes was found to contain bits of flint and fragments of pottery.

Significant suggestions as to the possible evolution of North American society as a whole are thrown out by C. M. Barbeau in articles entitled "Iroquoian Clans and Phratries" and "Parallel between the Northwest Coast and Iroquoian Clans and Phratries" (*American Anthropologist*, vol. XIX, pp. 392-402, 403-405). Barbeau argues that the clans and moieties (phratries) of the Iroquois are genetically unrelated, the clan being the basic unit which enjoys a far wider distribution and has survived the breakdown of the phratric division. He further contends that the various definite clan organizations of the continent probably had a common origin, having spread from a single centre of diffusion.

Kroeber's *Zufi Kin and Clan* marks an epoch in the study of Pueblo ethnology, for the almost exclusive attention of investigators to archaeological and ceremonial topics had prevented them from sufficiently clarifying the intricate social system that characterizes the Southwestern area. For one thing, Kroeber definitely disposes of the hoary belief that the matrilineal institutions of the Zufi are coupled with a matriarchate. The slender basis for this fallacy lies in the ownership of the houses by the women, who transmit them to their daughters. Apart from this undoubted property right to the dwelling, the women do not play a particularly prominent part either in private or public life. While clan affiliation depends on that of the mother, the father and the paternal relatives figure on equal terms in many social relations and ceremonial activities. The importance of the clan factor in Zufi life has thus been vastly overrated. It is true that certain offices in the medical fraternities and masked ceremonials, are linked with definite clans; and this likewise applies to the guardianship of the fetishes that play so remarkable a part in Zufi religion. But otherwise the clan is completely overshadowed in social importance by the family. There is no council of the clan members as such nor is there a clan house or head; property likewise is not associated with the clan but either with the tribe as a whole or with single families. Even as regards the exogamous clan functions, it should be noted that marriage into the father's clan is also disapproved, though not so strongly as within the mother's. One of the most illuminating results of Kroeber's discussion is definite proof that the same clan scheme is common to all the Pueblo Indians. Not only are similarly or identically named clans found among the Zufi, Hopi, Keresan, and Tanoan peoples, but the actual or theoretical linkage of these clans into social units of a higher order is remarkably uniform throughout the region. A far-reaching historical connection is thus estab-

lished among the tribes of New Mexico and Arizona. The kinship system of the Zuni lends partial support to the theory that a classificatory nomenclature is the concomitant of a clan or gentile organization. However, there are other features, among them an unusual tendency towards teknonymy, i.e., the designation of a relative as So-and-so's parent.

In *Plains Indian Age-Societies: Historical and Comparative Summary* R. H. Lowie sums up the present status of the problems suggested by these organizations on the basis of investigations conducted by the American Museum of Natural History for the last sixteen years. It is certain that the scheme found among the Arapaho, Gros Ventre, Blackfoot, Mandan and Hidatsa had a common origin. Internal evidence shows that its starting-point must be sought among the two last-named Village tribes, by which it was transmitted at one time to the Blackfoot and at another to the Arapaho. The resemblances in detail are such as to prove that direct contact once existed between the Village groups and the other tribes, and since such intercourse is without documentary evidence new light is thus shed on the early historical connections that obtained in the Plains area. The age-societies of the Indians display certain similarities to the clubs of Melanesia and the age-classes of the East African Masai. Nevertheless these resemblances are largely superficial. The Melanesians accentuate the purchase factor that is so strongly developed in America but there is no suggestion of an age-grouping, advancement being a purely individual affair. On the other hand, the Masai share the collective promotion of the Indian tribes but have neither definite societies nor a trace of the purchase idea. The Plains Indian system is thus a unique synthesis of two features,—the formation of a definite group of approximate age-mates and their collective acquisition of higher degrees. But while these societies thus represent a social phenomenon *sui generis*, they also exemplify a widespread fact of human society—the tendency of age-mates to unite in definite social groups.

S. A. Barrett has furnished a brief description of "The Washo Indians" (*Bulletin Publ. Museum*, Milwaukee, vol. II, no. 1), a hitherto neglected tribe living about the boundary line of Nevada and California in the Lake Tahoe region. They turn out to have very strong cultural affinities with Californian peoples, especially in the use of the acorn as food, in the erection of conical slab dwellings and semi-subterranean ceremonial houses, and in the prominence of fine coiled basketry. On the other hand, Plateau relations are even more marked, the methods of hunting, fishing, and preparation of food being identical. The twined basketry manufactured and the stone hand-mill also coincide with those of the Plateau. A characteristic feature of Washo culture is the importance of the rabbit chase, which was presided over by a hereditary chief, distinct from the tribal headman, who directed all organized hunting and fishing operations. The same author has devoted two papers, "Ceremonies of the Pomo Indians" and "Pomo Bear Doctors" (*Univ. of Cal. Publ. in Amer. Arch. and Ethnol.*, vol. XII, nos. 10 and 11) to the ritualistic and shamanistic observances of an important Californian tribe. While the Pomo culture is char-

acterized by the absence of calendric rites and the lack of a definite priesthood, the ceremonialism of the people reached a fair degree of development. In most of the dances men and women participated on equal terms, in others the number of each sex was fixed, while in still others there was restriction of membership to either men or women. However, the Ghost Dance, which perhaps represents the most important of the rituals, was restricted to properly initiated men, and thus corresponds to the secret organizations of neighboring tribes. The dancers impersonated the spirits of the dead and in this character entered the ceremonial house backwards, expressed the opposite of their real meaning, and otherwise tried to convey the impression that the spirits of the deceased were unused to mortal ways. Certain participants acted as both sergeants-at-arms and as clowns, but the spectators were not permitted to express mirth at their buffoonery. The most spectacular part of their activities consists in their jumping into the fire, picking up live coals and pretending to devour them. Among several Californian peoples there is a belief in "bear doctors,"—shamans deriving supernatural powers, bear-like characteristics, and invulnerability through an ursine tutelary spirit, who also endows them with the power to transform themselves into bears at will. In striking contrast to the Miwok and Yuki, the Pomo did not connect the "bear-doctors'" powers with a revelation granted by a bear but solely with the qualities of his bear-skin suit, which was invested with magical attributes by a series of ritualistic performances. While the bear-doctors of other tribes were often genuine shamans deriving their functions from the guardian spirit and exercising their abilities in the interests of patients, those of the Pomo were malevolent sorcerers plying their profession in secrecy and liable to death on detection by fellow-tribesmen.

E. W. Gifford has continued his publications on sociological aspects of Californian culture, in a paper on "Tübatulabal and Kawaiisan Kinship Terms" (*Univ. of Cal. Publ.*, vol. XII, no. 6), embodying a comparison of Shoshonean kinship nomenclatures. Kroeber's "California Kinship Systems," which has already been cited for its theoretical discussion, must be mentioned again as a contribution to Californian ethnography, inasmuch as the author compares, classifies, and discusses from an historico-geographical point of view the terminologies of Californian Indians. Another phase of aboriginal culture is revealed in Gifford's collection of "Miwok Myths" (*Univ. of Cal. Publ.*, vol. XII, no. 8), which supplies a series of tales current among one of the most important peoples of the central portion of the State.

A succinct survey of present knowledge on the ancient culture of Central America is supplied by H. J. Spinden's handbook on *Ancient Civilizations of Mexico and Central America*. Waterman has summed up the data on the social organization of part of this area in his treatise on *Bandelier's Contributions to the Study of Ancient Mexican Social Organization*. It appears from this review that Tenochtitlan had a division into clans or gentes grouped in four phratries and that the structure of society was fundamentally democratic. Other conclusions drawn by Bandelier as a disciple of Lewis H.

Morgan seem inadequately documented. Paul Radin has published an extensive collection of tales from southern Mexico under the caption *El Folklore de Oaxaca*. In "A Survey of Ancient Peruvian Art" (*Trans. Conn. Acad. Arts and Sci.*, vol. XXI) Philip Ainsworth Means attempts to classify the several types of ancient Peruvian civilization and proposes a chronological scheme, according to which the culture of Tiahuanaco II flourished between 200 and 900 A.D., and that of the Colla between 900 and 1100, and that of Chimu and Nasca between 1100 and 1400. To the same author ethnology is indebted for a comprehensive *History of the Spanish Conquest of Yucatan and of the Itzas*.

**EXPEDITIONS, CONGRESSES, PERSONALIA.** A number of expeditions have been dispatched under the auspices of the Bureau of American Ethnology: Dr. John R. Swanton visited the remnants of the Houma, Chitimacha and Koasati tribes; Mr. J. N. B. Hewitt spent several months among the Iroquois of Ontario for the purpose of securing further data on the constitution of the League; and Dr. Truman Michelson revisited several Algonquian peoples in the Middle West. In the interests of the U. S. National Museum Dr. A. Hrdlicka made an anthropometric investigation of Tennessee mountaineers and a general somatological study of the Shawnee Indians; Dr. W. Hough made archaeological excavations at Luna, New Mexico; and Mr. Neil M. Judd resumed archaeological researches in Utah. The American Museum of Natural History sent Dr. H. J. Spinden to pursue his studies of Central American ruins; Mr. N. C. Nelson concluded his reconnaissance of the Galisteo basin in New Mexico; Mr. Leslie Spier followed up previous work at Zuni; and Mr. Earl H. Morris continued excavations at Aztec, New Mexico. By cooperation with the Bureau of American Ethnology the Museum of the American Indian was able to send out Mr. Alanson B. Skinner to join Mr. F. W. Hodge, ethnologist-in-charge of the Bureau, in an investigation of the Zuni ruin at Hawikuh. For the University of California Mr. E. W. Gifford examined the social institutions of several Californian tribes, paying special attention to the ceremonial activities of the Miwok.

The Nineteenth International Congress of Americanists, which convened in Washington, D. C., in December, 1915, published its *Proceedings* during the year. The American Anthropological Association met in Philadelphia in conjunction with the American Folk-Lore Society during Christmas week.

Several events of a personal nature are of general interest. On January 2, 1917, Sir Edward Burnett Tylor, for decades the dean of English anthropologists died at the age of 84. For an obituary notice see *American Anthropologist*, 1917, pp. 262-268. In honor of Professor Wm. H. Holmes's seventieth birthday a group of his colleagues contributed papers to a sumptuously illustrated *Holmes Anniversary Volume*. Dr. W. H. R. Rivers, the eminent British anthropologist, has been actively engaged in applying psycho-analytic methods to the treatment of officers who have suffered nervous derangement as a result of their war experiences.

**ANTIGUA.** See LEEWARD ISLANDS.

**ANTI-SALOON LEAGUE OF AMERICA.**

A national league of organizations opposed to

the traffic in alcoholic liquors, with 48 subsidiary State leagues, provided with machinery for focusing public opinion upon all national political phases of the alcohol problem. The national printing plant and the executive offices are at Westerville, Ohio, and the Legislative Committee at Washington, D. C., with offices in the Bliss Building. The league, through its general counsel, Wayne B. Wheeler, successfully upheld the constitutionality of the Webb-Kenyon Interstate Shipment Law, the decision on which was rendered by the United States Supreme Court on January 8, 1917. This body was the chief factor in pressing the enactment of prohibition for Alaska, February 2, 1917; the prohibition referendum for Porto Rico, February 20, 1917; the Jones-Randall Anti-Liquor Advertiser Act, February 21, 1917; prohibition for the District of Columbia, February 28, 1917; partial prohibition in the Food Control Law, August 8, 1917; and the submission on December 17, 1917, of a proposed prohibition amendment to the Federal Constitution to the various States for their consideration.

The officers of the league for 1918 were as follows: President, Bishop Luther B. Wilson; general superintendent, Rev. P. A. Baker, Westerville, Ohio; associate general superintendent, Rev. Howard H. Russell, D.D.; secretary, Rev. S. E. Nicholson, Richmond, Ind.; treasurer, Foster Copeland. See LIQUORS.

**APARTMENT HOUSES.** See ARCHITECTURE.

**AQUEDUCTS.** THE CATSKILL AQUEDUCT. On October 13 was formally dedicated the Catskill Aqueduct, the first installment of New York's \$177,000,000 enterprise, which had been under construction for some twelve years. This work has been referred to from time to time in the *YEAR BOOK*, but in its completion, it may be mentioned for the notable dams, the Ashokan and the Kensico, the siphons under the Hudson River and the Narrows and the enormous amount of work involved in tunnel, cut-and-cover, and steel pipe siphon. The New York Board of Water Supply, which had this project in charge, was organized in June, 1905, and J. Waldo Smith was selected as chief engineer. A notable engineering staff was assembled and the work well organized, while as consultants a number of the best engineers and scientific men was secured. At the formal acceptance ceremonies in Central Park on the afternoon of October 13, Mayor Mitchel turned on the water which issued forth to a height of 80 feet in the fountain. For a number of months the aqueduct had been used by the city and 250,000,000 gallons per day were available. The high pressure distribution system under the city had been tested and connected with the former distribution mains, and the necessary adjustments were provided for the higher pressure to be used. In a number of cases, there were failures of the previous system of mains, but these were not unduly serious and the entire change over to the new system was effected with a minimum of inconvenience. It was an interesting fact in connection with the Catskill Aqueduct that at the time of its acceptance the cost of the work was \$9,000,000 under the estimate, and that water was delivered a year and three months ahead of the time promised. One of the interesting reports made in connection with the aqueduct construction was that of the hydrostatic tests

on the 10,300 feet of 36-inch pipe forming the siphon under the Narrows of New York harbor. At a pressure of 130 pounds, a leakage of but 5.6 gallon per minute was observed, and at 100 pounds pressure only 1.5 gallon per minute.

**THE SHANDAKEN TUNNEL.** In order to carry out another section of the original project, on September 11, the Board of Water Supply of New York City opened the bids for the construction of the 18-mile Shandaken Tunnel of the New York Water Supply. This tunnel extends from Gilboa, Schoharie County, to Allaben, Ulster County, N. Y., and was to carry water from a new reservoir on Schoharie Creek southerly to the Ashokan reservoir, from which the main water supply of the Catskill Aqueduct flows to New York City. The tunnel was to be a 10 ft. 3 in. by 11 ft. 6 in. horseshoe, concrete lined and grouted in rock, and was to be constructed from light shafts.

The lowest bidder of the work was the Degnon Contracting Company with a bid of \$12,138,000, and on November 9, the Board of Water Supply duly awarded the contract despite the protests of the Mayor-elect John F. Hylan and his associates, Controller-elect Charles L. Craig, and Albert E. Smith, President of the Board of Aldermen. The Schoharie Water-shed from almost the beginning was made an essential part of the Catskill project, although its supply did not seem to be needed for many years, and the contract was awarded on the score that with experienced contractors possessed with the necessary equipment, the work could be done better now than if postponed to a later stage.

**THE LOS ANGELES AQUEDUCT.** During the year 1917 construction was begun on the Chatsworth reservoir at the upper end of San Fernando Valley, northwest of Los Angeles, Cal. Here was to be provided about 27,000 acre-feet of storage, and the reservoir thus formed was to be the nineteenth and last in the chain of reservoirs of the Los Angeles Aqueduct system. The construction involved two large earth-fill dams and four smaller dams or dikes spanning gaps between the hills, and it was expected that it would require more than a year to construct them. The same system used on other hydraulic dams of the aqueduct, namely, dump cars to convey the material from the steam shovels to a conveniently placed dump, whence it was pumped to the dam, was being followed, and the total yardage to be moved on the work was about 1,040,000 cu. yd. of which 740,000 and 190,000 cu. yd. were to go into the first and second dams respectively. The Chatsworth high line conduit had been finished for several months and was serving the adjoining tracts under irrigation. This line was to be extended about three miles to bring the aqueduct water to the new reservoir. This conduit was to be completed in time to furnish water in the spring of 1918, and thus take advantage of such storage as the work done on the dam would then afford.

Several serious breaks occurred in July on the Los Angeles Aqueduct: the first in the Owens Valley produced by a landslide occasioned by an earthquake, and two others on July 15, one 81 miles from Los Angeles, near Neenac, and the other 165 miles north of Los Angeles, in the Soda Springs tunnel. The Owens Valley

break was in an open concrete flume. It was quickly repaired by the use of riveted steel pipe, while the reservoir at Haiwee maintained its service. The Neenac break was below the Haiwee reservoir, where the flow was through covered conduit, and was repaired by the installation of a 9-ft. steel pipe. The break in the tunnel was unexplained, but was promptly restored to service.

**ARABIA.** The great peninsula of southwestern Asia, lying south of Syria, Mesopotamia, and the Persian Gulf. Most of the country is little known, and fully a third of it quite unknown, to the Christian world. For the most part, government, so far as government exists, is administered by tribal leaders. The estimated area of Arabia is about 1,200,000 square miles, including the Syrian Desert and the Sinaitic Peninsula; without these, about 1,000,000 square miles. The number of inhabitants has been estimated at 7,500,000, but this figure may be regarded as excessive; the country is largely desert, incapable, except in certain districts, of supporting more than a sparse population. The more important divisions or regions of Arabia are: the Sinaitic Peninsula, which belongs to Egypt; bordering the Red Sea, Hejaz and Yemen, nominally Turkish vilayets; between these, the mountainous region of Asir, where Turkish dominion is negligible; at the southwest corner, Aden, which is British; to the east of Aden, along the southern coast, Hadramaut, Mahra, and Shihr; at the southeast, Oman, which is an independent state but under British influence; Hasa (bordering the Persian Gulf northwest of Oman), which, together with Nejd, is nominally a Turkish vilayet; Koweit, on the northwest coast of the Persian Gulf; in the interior, the Syrian Desert, the desert region of Nufud, the Bedouin emirate of Jebel Shammar, Nejd, and, at the south, the great desert territory of Dahna. Of these divisions or regions of Arabia, the first in importance is Hejaz, which contains the sacred cities of Mecca and Medina.

**HISTORY.** The Arabian movement which originated with the Grand Sheriff of Mecca Hussein, who assumed the title of King of the Hejaz in November, 1916, advanced steadily. The defeat of the Turks at Maan was announced on July 12 and thereby the Arabs gained a foothold at the head of the Gulf of Akaba. Meanwhile British naval forces had captured the fort at Saliff on the Red Sea coast. Toward the end of August it was reported that further operations were going on against the Turks and that the Arab forces were carrying out a plan for the systematic destruction of the railway line north of Medina and for the capture of Turkish posts. It was reported that on several occasions the Arabs had attacked superior numbers of Turks and had overcome them.

**ARBITRATION, INTERNATIONAL.** See INTERNATIONAL PEACE AND ARBITRATION.

**ARBITRATION AND CONCILIATION, INDUSTRIAL.** It has been established that the annual losses from strikes and lockouts in the United States in recent years has been about \$250,000,000. This strike loss is, however, only one of various economic factors making steadily for an increased sentiment in favor of more peaceful relations in industry. From the standpoint of the public every advance in industrial organization brings increasing interdependence

throughout the entire economic structure with the result that every interruption of industry comes to affect more and more seriously an ever increasing number of persons. The interest of the public therefore in the continued operation of all fundamental industries has grown apace. So important for the established routine of daily life are the facilities for communication and transportation and the supplies of coal, various metals, and such universally consumed articles as sugar that a large group of the public has come to feel that interruption of the supply of these services and commodities must be prevented, even by the use of compulsory methods if necessary.

From the standpoint of the employer still other factors favor methods of conciliation and arbitration. Scientific management studies have shown that the continued "hiring and firing" or excessive "labor turn-over" is a very costly industrial policy. Many plans therefore are being developed to obtain a greater permanency of the working force, such as more careful selection, housing and welfare plans, and methods for the peaceful and judicial settlement of grievances and disputes. Moreover the growth of organization and the consciousness of the power that comes with unity in the ranks of labor have forced many employers to the acceptance of collective bargaining. Consequently an increasing number of trade agreements is characteristic of industrial developments of recent years, including provision for conciliatory methods. From the viewpoint of labor the main reason for the increasing sentiment in favor of methods of arbitration and conciliation is the desire for a voice in the determination of the conditions of work. There is also the desire to be freed from the haunting fear of sudden loss of job through the arbitrary use of executive authority.

The voluntary schemes now being put into operation range all the way from those trade agreements which give labor representatives some voice in determining the major conditions of labor to such elaborate plans as the protocol agreement in the dress and waist industry in New York. In the latter plan provision is made for shop committees to handle grievances and disputes in the first instance, with opportunity for appeal finally to a board of arbitration whose finding is by agreement to be compulsory. Less highly developed plans have been instituted by Hart, Schafner and Marx of Chicago, William Filene's Sons Company of Boston, and the Colorado Fuel and Iron Company. These include plans for the presentation of grievances by any employee, their adjudication by boards composed partly of employees with appeal to higher authorities, even to the head of the business.

The unwillingness of employers, however, to grant laborers a permanent voice in the fixing of working conditions prevents the universal application of the above methods. Consequently State governments have set up various bodies for arbitration and conciliation which either party may call upon to intervene or which in some cases may intervene of their own initiative. Canada has provided for compulsory investigation (see below). New Zealand since 1894 adopted compulsory arbitration; while late in 1916 the United States government passed the Adamson law to prevent a railway strike (see below).

**ADAMSON LAW.** Owing to a threatened strike on 225 eastern railways in August, 1916, Congress, under the vigorous insistence of President Wilson, enacted the so-called Adamson Law just in time to forestall the execution of the strike order which had been issued to take effect on September 4. This law, variously held to be a wage-law or an hour-law, established eight hours as the normal day for the computation of a day's work and a day's pay for railroad employees. In general it had the effect of granting ten-hours' pay for eight-hours' work. It was to become effective January 1, 1917, but meanwhile suit was brought by the Missouri-Oklahoma and Gulf Railroad Company to test the law's constitutionality. Judge Hook of the United States District Court at Kansas City declared the law unconstitutional; appeal was immediately taken to the Supreme Court. This court entered into an arrangement with the Attorney General whereby records were to be kept by the railways of the time and mileage of employees concerned, with the understanding that if the law was upheld back pay should be given from January 1. The railway brotherhoods were greatly disappointed to find themselves cheated out of the immediate benefits of the law and insisted that it should be put into immediate operation, holding that the act should stand as the law of the land until declared unconstitutional. The union leaders issued a circular to the membership calling attention to the new developments and to the fact that the strike order of August was still in effect.

Argument before the Court was made on January 8, and decision was expected by the men early in February. With the passing of each week they became more and more impatient, until finally on March 12 the brotherhood leaders agreed upon a new strike order to be effective on March 17. They announced that if decision were rendered meanwhile and were favorable there would be no strike; if unfavorable or not rendered at all there would be a strike. They planned a progressive strike, to begin on a few main lines and to spread gradually. They agreed that passenger and milk trains should be run for five days following the beginning of the strike. Eastern roads put up embargoes on freights and Western roads accepted goods for shipment "subject to delay." The governors of Ohio, New York, Maryland, and Wisconsin took steps to use the militia or to operate the roads under martial law, and numerous roads took special measures to protect their property.

Then the government again intervened. The President issued an appeal to both sides and sent a special appeal to the union leaders. He appointed Secretaries Lane and Wilson of the Cabinet and two members of the Council of National Defense, Daniel Willard, president of the Baltimore and Ohio Railway, and Samuel Gompers, president of the American Federation of Labor, to serve as a mediatory body. These men came to New York and succeeded first in securing a postponement of the strike for 48 hours, or from Saturday to Monday. This was for the purpose of enabling the Supreme Court if possible to render its decision, Monday being "decision day." This body then entered into extended deliberations with Elisha Lee, representing the railways and the heads of the railway brotherhoods, with the result that early Monday morning, March 19, an agreement was

reached. This was largely due to the strong appeals of President Wilson and Secretary Lane to the railway managers for patriotic regard for the interests of the country in view of the possibility of war with Germany. The agreement reached dealt with various aspects of the war and provided for the establishment of ten-hours' pay for eight-hours' work with overtime at the same rate.

On the same day the Supreme Court by a vote of five to four declared the law constitutional. Chief Justice White wrote the majority opinion in which Justices McKenna, Holmes, Brandeis, and Clarke concurred. Those dissenting were Justices Day, Van Devanter, Pitney, and McReynolds. The majority opinion held the Adamson Law to be workable, not confiscating, nor in excess of the powers of Congress to regulate commerce; they held it to be in effect the application of the power of compulsory arbitration "which it (Congress) undoubtedly possesses." The decision was thus based on the power of Congress to regulate commerce and not on the social justice of laws regulating hours and wages. The decision, however, declared the business of common carriers to be a public business and its continued operation to be a matter of great public concern.

IN CONGRESS. The foregoing events resulted in the introduction of a strike prevention bill in the Senate by Senator Newlands and in the House by Representative Adamson respectively chairmen of the Committees on Interstate Commerce. This bill provided that whenever a dispute should arise between the railways and their employees both sides should notify the Federal Board of Mediation and Conciliation. If this Board should fail to bring about an agreement it should suggest arbitration. If arbitration should not succeed the matter should be referred to the President, who should then appoint a commission of three to investigate. This commission must make its inquiry and report within three months. Either strike or lock-out should be illegal until 30 days after this report under heavy penalties. Numerous hearings were held on this measure, but its enactment was interfered with by war legislation.

Another bill was submitted by Secretary of Labor Wilson. This was originally drawn to meet such a situation as that resulting in the Adamson Law, but was subsequently modified to include not only steam railroads but also street railways of the national capital following a street railway strike in Washington. It provided for a United States industrial adjustment commission to serve as an industrial court for interstate railways and District of Columbia street railways. This commission would have power not only to investigate but to pass judgment upon disputes and issue orders of adjustment. Appeal from the commission's orders to the Federal District and Circuit Courts was provided. While the commission could not prevent the dismissal of employees nor their voluntary abandonment of their positions it was believed by Secretary Wilson that it would in most cases prevent either strikes or lockouts by removing the motives therefor.

OTHER FEDERAL ACTION. With the entrance of the United States into the war the need of preventing cessation of industry because of labor disputes became extremely urgent. Consequently the Committee on Labor of the Ad-

visory Commission of the Council of National Defense early in June began the establishment of local committees of mediation and conciliation. Its Committee on Mediation and Conciliation headed by D. Everit Macy of New York decided to establish local committees in the following cities: New York, Boston, Baltimore, St. Louis, Birmingham, Atlanta, Pittsburgh, New Haven or Bridgeport, Cleveland, Indianapolis, San Francisco, Portland or Seattle, Chicago, Philadelphia, Detroit, Salt Lake City, Denver, New Orleans, Kansas City, Louisville, St. Paul, Minneapolis. These committees would contain representatives of wage earners, employers, and the general public to be appointed by Samuel Gompers, chairman of the Committee on Labor of the Council. One of the most important agreements of the year was that between the government and the international unions engaged in American shipyards. This was concluded on August 24 after a strike vote had been adopted by about 100,000 men in the shipyards of the Pacific coast and a walkout had been delayed only by vigorous action of the union officials. There was also much unrest in the shipyards on the Atlantic coast. The compact created a National Board of Adjustment to be a final arbiter as to wages, hours, and conditions of work. The labor unions, all of which belong to the American Federation of Labor, agreed not to strike while the agreement was in force. Awards shall be retro-active as to wage demands; wage readjustments may be demanded after six months; and all labor standards will upon demand be given due consideration. A very significant aspect of this agreement is that it was made directly by the government with representatives of organized labor. President Wilson named D. Everit Macy chairman of the board. Samuel Gompers named Alfred J. Berres as the labor representative; and other members were Assistant Secretary of the Navy Roosevelt and the representative of the Emergency Fleet Corporation. In addition when hearings are held in a given plant a representative of the owner and a representative of the working forces of the plant are to sit with the board and exercise voting power. In case of tie votes Secretary of War Baker or the chairman of the Council of National Defense may decide.

The Secretary of Labor was given authority to intervene as a mediator in labor disputes by the organic law establishing the department in 1913. His services in this respect had steadily increased. In the three years and four months up to June 30, 1916, the Department of Labor had adjusted 232 disputes. In the succeeding eighteen months the Department had intervened in about 200 controversies and had succeeded in adjusting more than 100.

CANADIAN ACT. A Canadian law of 1907 provided for the compulsory investigation of labor disputes forbidding either strike or lockout before the findings of the investigating commission had been made public. In view of the greater interest in the United States various investigations of the working of this law were published in 1917 (see titles below). These tended to show that the law had been far from a complete success. It was found that there had been more than 200 illegal strikes and lockouts affecting more than 8000 employees with a loss of over 3,000,000 working days. It was pointed

out that the administration of the act had not fostered respect for law because only \$1660 of fines had been imposed up to the close of 1916, whereas under the provisions of the act a minimum of \$30,000,000 in fines should have been imposed. Labor opinion regarding the law is much divided, though a majority was either opposed or in favor of changes. In last analysis the enforcement of findings under the Canadian act depends on the state of public opinion; this is the same force upon which voluntary methods of mediation and arbitration depend for enforcement. While opinion as to the final efficacy of the method of compulsory investigation is less optimistic than formerly, nevertheless it has become clear that an essential of any successful method is some plan for supplying the public with an impartial statement of facts.

**ARCHAEOLOGY.** The continuation of the great war has been naturally reflected in a decline in archaeological investigations. The Archaeological Institute of America held its annual meeting at the University of Pennsylvania, December 26-29, 1917. Dr. James Egbert was elected president.

**EGYPT.** In Egypt, however, which has felt less the stress of the combat, a certain amount of exploration has continued. Thus at Gizeh the expedition of the University of Pennsylvania has investigated the necropolis adjacent to the pyramid of Cheops. The tombs belonged to priests and lesser officials, and take the form of a shaft cut deep into the rock (that is, to the depth of two to three metres) with a small burial chamber at the bottom. In the earlier of the tombs the body was placed in a shallow pit which was dug in the floor of the chamber. In some instances the body was put in a wooden coffin and the pit itself closed with slabs of stone. Objects usually associated with interment were rarely found. Among the tombs opened were those of Melady and his wife Ruwz. In the chamber of the tomb of the latter was found a table of offerings in an excellent state of preservation. Particularly valuable to the historian is the inscription which appears on this table in that it contains the cartouches of Cheops, Chepren, and Dedefra, showing that these kings followed each other in the order given. The ceiling of the offering chamber of Sokf was vaulted with bricks of mud so arranged as to interlock. This appears to be the earliest example of the use of interlocking brick construction.

At Lisht, in spite of the embarrassment occasioned by the entrance of several of its members into the American and British armies, the expedition of the Metropolitan Museum of Art has steadily continued its work. Further ex-

ploration of the area near the pyramid of Sesotris I was carried on. In the course of this work the remains of a smaller pyramid to the southeast of the principal structure were discovered. This tomb had been constructed for some other member of the royal family. In the cemetery of "court" tombs which surround the pyramid temenos were found a number of tomb-chambers, several never disturbed, which yielded interesting examples of funerary furnishings of the period.

After its work at Lisht the same expedition devoted its attention to the site of the Palace of Amenhotep III at Thebes. In the northern part of the area was discovered a building surrounded by an enclosure wall approximately 150 x 200 metres in length. The stamped bricks used in its construction bore the legend: "The House of Amon in the House of Rejoicing." This means "The Chapel of Amon in the House of Rejoicing," and the latter phrase is the regulation appellation of the Palace. From inscribed objects found on the site it was learned that this was the Festival Hall of Amenhotep's second *Sed* festival, celebrated in his thirty-fourth year. Many interesting decorative features of the building were unearthed, such as wall-tiles of blue faience and the remains of wooden cornices ornamented with inlaid feather pattern of faience and gilt plaster.

Besides the work thus far reported at Lisht and Thebes the expedition also explored the Tomb of Kenamon in the southern slope of Sheikh Abd el Kurneh, and completed the excavation of its elaborate subterranean burial chambers.

**GREECE.** In this country little has been done in the way of archaeological investigation. It is, however, interesting to record the discovery at Saloniki of an inscription possibly of the time of Trajan which records the honors accorded one Manius Salarus Sabiorus by the city because of gifts which he had at various times made to the city and its people. This Sabiorus was gymnasiarch.

**ITALY.** That no new excavations of any considerable extent have been undertaken is to be expected when one considers the distracted condition of affairs in this country occasioned by the war. Certain old sites have continued to be worked, however, and discoveries due to building or farming operations have been followed up.

At Acqua Traversa excavations have brought to light what is in all probability the ancient Via Veientana. To the north of this site a *Statio* of Roman date has been examined. It proved to contain a series of large storerooms filled with jars for storage of food.

At Castellina in Chianti, which lies between Florence and Siena, an early Etruscan tumulus has been explored. In several ways it reminds one of the Regolini-Galassi tomb at Cervetri. From it was recovered a lion's head which is one of the earliest examples of Etruscan sculpture. It is interesting to note that it seems to show a relationship with Oriental Greek art. At Cervetri (Caere) important investigations have been carried on. At Fabriano, in Umbria, has been found an Italic chariot. It has been placed in the Museum of Ancona. Its discovery recalls the remarkable chariot now in the Metropolitan Museum in New York City. But it differs from the New York example in being intended for war and not for ceremonial purposes.

At Narce an extensive cemetery has been uncovered. Ostia, which for years has been the site where excavations have been systematically conducted, continues to reward the excavators with interesting finds. Of particular interest is a block of buildings lying to the east of the great temple. So far as can be made out, the building has been subject—at least four times—to reconstruction. Among other buildings uncovered is one showing a niche at one end. This is believed to be a small basilica. To the north of the Temple of Vulcan, also at Ostia, has been discovered a market place, rectangular in plan and containing two courts. Among the houses uncovered two are distinctly interesting for the preservation—in one of remarkably well preserved paintings and in the other of a balcony which ran around two sides of the building. A discovery of the local records of the town of Ostia, or at least of fragments of them, will be of interest to the historian in that they tell of the death of Tiberius at Misenum in the year 37 and speak of the taking of his remains to Rome by the soldiers.

At Pompeii the searchers have discovered the skeletons of four more persons who died at the time of the destruction of the town. The unfortunate persons had sought protection in the house of Trebius Valens, where they were found. From the fact that two wore golden earrings it is known that these two were women. One of the others was a boy. The fourth one is of undetermined sex. At Populonia the excavators have discovered traces of an Etrusco-Roman necropolis. Three tombs have yielded objects of clay and bronze such as vases of Italo-geometric, Italo-Corinthian ware, and bucchero, and fibulae and a bronze sword.

Much archaeological material has come to light in Rome. In the Piazza Colonna has been uncovered a large group of blocks belonging to Imperial times. From the same site have been recovered two fine heads: one an excellent portrait type of the time of Caracalla, the other that of a child of the Augustan period. Very recently outside the Porta Maggiore a remarkable building has been discovered. Its location is directly under the railroad which runs to Naples and its existence was made known by the slide of dirt under the railroad. The building, which belongs to the second century of our era, is a fine basilican hall with atrium and apse. The hall is richly ornamented with stucco decorations. In the apse the ornament takes the form of a female figure, who may be Aphrodite, pushed along by an Eros. The vaulting of the hall is covered with subjects representing the tribulations of the soul in this world and the attendant punishment or reward in the next. On the walls of the aisles are figures of orantes alternating with ritualistic and sacrificial objects. The main hall is in pure white; the vestibule is decorated at the base of the wall with red and with figures of birds and with flowers. The ceiling is blue. The entrance is peculiar in character, for instead of being in the front of the atrium it was found to the left of that part of the building; that it was meant to be more or less concealed is evidenced by the fact that the corridor which approached it led around to the rear of the building. The building seems to have belonged to some Dionysiac or other religious secret society.

Between the Porta Maggiore and the Lateran some late Republican tombs of interesting type have been discovered. In them were found an interesting group of portrait busts of members of the families who were buried in these tombs. Close to the Catacombs of Pontianus a large Christian cemetery of the sixth to the seventh century has been discovered. Excavations on the site of the Villa Patrizi have brought to light the existence of ancient tufa quarries from which were built the Servian wall and the platform of the temple of Jupiter Capitolinus, and also pozzolana quarries. These respectively at a depth of seventy and fifty feet are under a villa of Imperial date. On the site of Nero's Golden House a fine domed hall and several rooms with paintings have been discovered. The paintings are especially fine.

At Siete (Etruria) the ruins of a Roman bath have come to light, while at Veii, another Etruscan site, other discoveries have been made. In the latter place the foundations of the Acropolis gate have been exposed. Besides this two strata of huts of Italic and Etruscan origin respectively have been found. From the temple site have been recovered a fine series of terra cotta figures. Especially beautiful are the figures of Apollo and Hermes, and the whole group is of exceptionally high order. This work has been conducted by Collini and his staff.

AFRICA. At Cyrene and Tripoli important discoveries of sculpture have been made. Those at Cyrene include a portrait head of the period of the Antonines. The excavation of the precinct of Apollo continues steadily.

ARCHITECTURE. At the close of the third year of the great war, despite numerous conditions of uncertainty, architecture in the United States was by no means quiescent. The country had been prosperous, and until its entrance into the war, had been in a condition by no means unfavorable for the development of architecture. With the inevitable distraction occasioned by actual participation in the war, with the diversion of many architects into active military service, it became apparent that future work would be reduced to a minimum.

It was realized, however, that certain kinds of building, on the other hand, were stimulated by the existence of war to a corresponding degree as certain other kinds were retarded. The sudden and extensive expansion of certain industries called for new industrial buildings, and for large additions to plants and factories already built, while the sudden importation of hundreds and (in some cases) thousands of additional operatives, gave rise to immediate housing problems. These were met, in many instances, by intensive study of parallel problems which had arisen in a number of industrial centres in England, and it seemed reasonable to predict in 1917 that the immediate necessities arising from the housing problems created by the sudden expansion of certain war industries would leave American architects, as well as the executives of many large industries, the richer after the war by having developed new, practical, and intelligent housing solutions which would be of no less value in normal times.

INDUSTRIAL BUILDINGS. In the review of tendencies apparent in the many large machine works and factories built during 1916, it was observed that the latest type is the "daylight

ARCHITECTURE

A NOTABLE TOWER BUILDING IN NEW YORK, No. 50 EAST 42nd STREET  
JARDINE, HILL & MURDOCK, ARCHITECTS

factory," in which the object is to provide a maximum of void, or window space, with a minimum of solid, or wall space. The modern factory, then, consists of little more than narrow piers of brick or concrete, with vast expanses of metal-and-glass sash.

Typical of such factory construction were the new Willys-Overland building, at Toledo, O. (Mills, Rhines, Bellman and Nordhoff, architects), and the building for the Wahl Adding Machine Co., at Chicago (Victor Hellstrom, architect). At Flushing, Long Island, the new buildings of the Nathan Manufacturing Co. (Eugene Schoen, architect) afforded a good example from which to study the modern method of designing and constructing industrial buildings. An interesting building, partly an office building and partly industrial, was seen in the new Detroit News Building, Detroit, Mich. (Albert Kahn, architect).

**COST OF BUILDING.** It naturally transpired that the immediate diversion of labor and materials resulting from the quick erection of barracks, storehouses, etc., in the numerous great army cantonments throughout the country had affected local civilian building. General contractors had found their greatest problem in the labor situation, and many civilian building projects necessarily were stopped or postponed on this account. It must be remembered, however, that this condition existed chiefly in the immediate locality of the several cantonments, and that the only widespread impediment to building projects came from the fear of a railroad freight embargo which would delay or render impossible carload shipments of building materials in favor of moving coal, produce, and merchandise directly connected with the military needs of the country. Such a condition was considered well within the bounds of possibility, and likely to exert a serious effect on building operations.

**WAR CONDITIONS.** "Priority Orders" began to affect some manufacturers, who were ordered to give government orders priority over any and all civil orders. For example, orders for brick and structural steel required for a government munition plant made it impossible for the brickyards and foundries holding the order to give precedence in the shipment of brick or steel for use in any private enterprise. These contingencies and restrictions are mentioned here as having affected many building projects of the last months of 1917. But it was to be borne in mind that building activities which suffered during this period would suffer from inevitable restrictions regarding labor and materials: not from any financial reasons.

**TYPICAL BUILDINGS OF 1917.** The following paragraphs, dealing primarily with the more typical buildings of several kinds, will point out a few of the most conspicuous additions to the year's quota of state and city buildings, educational buildings, banks, libraries and museums, hotels and apartment houses, residential architecture, church and memorial architecture, commercial architecture, clubs, and railroad stations. Partly due to general conditions and partly to the continued popularity of motion pictures, no important theatre buildings were under construction at present, and but two which were completed in 1917 seemed noteworthy: the Rialto Theatre, in Chicago, Ill.

(Marshall and Fox, architects), and the Schenley Theatre, a pleasing use of the Adam style, in Pittsburgh, Pa. (H. E. Kennedy, architect).

The year 1917 witnessed the completion of the Wisconsin State Capitol, at Madison, Wis. (George B. Post, architect), a conventional building of the type generally associated with state capitols. The plan is cross-shaped, with a dome surmounting a circular Corinthian colonnade above the intersection. The ends of the main structures support classic pediments, with sculpture, above Corinthian columns, the whole representing a typical state capitol, and affording no more occasion for adverse than for enthusiastic criticism. The interiors are sumptuously carried out in rich marbles and elaborate woodwork and the decorations include interesting mural paintings by Albert Herter.

Two new city halls were also to be mentioned, one in San Francisco, Cal. (Bakewell and Brown, architects); the other in Cleveland, O. (J. Milton Dyer, architect). The first is of the familiar "capitol dome" type, though with more feeling of the Beaux-Arts in its handling than of the traditional "Early American" feeling of Washington, or of the old Massachusetts State House in Boston. The Cleveland city hall, a large rectangular building, conveys a far stronger expression of classic dignity. An imposing building of conventionally "governmental" character is the new post office at Washington, D. C. (Oscar Wendroth, supervising architect).

**EDUCATIONAL BUILDINGS.** Interesting additions were made to a number of college groups, the most noteworthy, perhaps, being the work of Day Brothers and Klander, architects, at Cornell, Ithaca, N. Y., and at the University of Pennsylvania, Philadelphia, Pa. The buildings were, in both cases, dormitories, admirably designed in a free, informal rendering of that traditional English collegiate style which is more Tudor than Gothic. The same style was seen also effectively employed in the new Alumnae Hall (Walter F. Price, architect) at Mt. Holyoke College, South Hadley, Mass. An interesting study in scholastic architecture which partook of a more Gothic flavor was the Convent and Academy of Notre Dame, in the Boston Fenway, Mass. (Maginnis and Walsh, architects)—a group of buildings in brick and stone, the central feature a boldly unsymmetrical tower.

To the University of Washington, Seattle, Wash., was added a building of Home Economics (Bebb and Gould, architects), designed in a rather stiff and mannered Jacobean style; and to Lafayette College, Eaton, Pa., a chapel (Carrere and Hastings, architects)—a thoroughly scholarly version of the English Renaissance style of Sir Christopher Wren. Three other new college buildings were the Classics Building, at the University of Chicago (Shepley, Rutan, and Coolidge, architects); the University Library, at the University of California (John Galen Howard, architect); and the Walker Gymnasium, at the Stevens Institute (Ludlow and Peabody, architects).

One of the most interesting single college buildings of the year was the Musical Department Building, at Harvard University, Cambridge, Mass. (John Mead Howells, architect), a fine study in Georgian Colonial, with some suggestion of the later manner of Bulfinch. The

type of brick Colonial architecture exemplified by the earliest buildings at Harvard had much of national tradition to recommend it, an unusually successful adaptation to be cited was the new group of buildings for Loomis Institute, Windsor, Conn. (Murphy and Dana, architects).

**SCHOOL BUILDINGS.** School buildings were receiving constantly greater architectural attention, and proceeded, in 1917, largely along the lines described in the YEAR BOOK of 1916. The following were new public school buildings of the modified Tudor type so successfully developed by W. B. Ittner, architect, of St. Louis, Mo.: the Cherry school, Toledo, O. (Edwin M. Gee, architect); the Morrison R. Waite and the Jessup W. Scott schools, also of Toledo, O. (David Stine, architect); the Washington High School, Milwaukee, Wis. (Van Ryn and De Gelleke, architects); and the Grover Cleveland High School, St. Louis, Mo., the Forest Avenue High School, Dallas, Texas, the Central High School, Minneapolis, Minn. (W. B. Ittner, architect).

An exceptional piece of private school architecture was seen in the Taft School, Watertown, Conn. (Bertram G. Goodhue, architect), and an interesting variation in public school design in the Benjamin Franklin School, Portland, Ore. (F. A. Narramore, architect), in which the style was adopted from the Independence Hall group of Philadelphia—red brick, white trim, and a graceful Georgian cupola.

The school architects of California were showing a tendency to deviate from the free Tudor style which has become so popular in the Middle West, and contributed several large school buildings of conspicuous interest and merit. Notable among these were the following: the Grammar School, Chino, Cal. (Withey and Davis, architects), a distinctly Italian design, with a well-designed Palladian entrance; the Grammar School of Glendora, Cal. (Allison and Allison, architects), also Italian, with brick as its material, and also with a Palladian entrance; the Grammar School of Santa Paula, Cal. (Withey and Davis, architects), a school designed in the local Mission style. Another unusual California school building was the Owensmouth High School, at Los Angeles (Henry Harwood Hewitt, architect), an impressive design, with a monumental Corinthian colonnade. The recent architectural attention devoted to public school buildings in the United States was highly commendable, as providing for school children an architectural environment commensurate not only with the dignity of the school as an institution, but tending as well to cultivate an instinctive appreciation of the nature and meaning of architecture.

**BANKS AND INSURANCE BUILDINGS.** Successive years record little if any variation in the conventional treatment accorded to banks and insurance buildings. A Classic order is usually employed, and above the entrance façade, the stories designed for general offices usually compromise, to greater or less extent, the strictly architectural merit of the building as a whole. A typical modern bank and office building of conspicuous merit is the building for the Bankers' Trust and the Astor Trust, at Fifth Avenue and Forty-second Street, New York City (Montague Flagg, architect), carried out in a clean-cut, modernized Italian Renaissance type of detail of the character in which York and

Sawyer, architects, have distinguished themselves.

Bank and insurance buildings of rather conventional type, finished during 1917, were the First National Bank, Portland, Ore. (Doyle and Patterson, architects); the Merchants National Bank, New Bedford, Conn. (Alden and Parker, architects); the Colorado National Bank, Denver, Col. (W. E. and A. A. Fisher, architects). The Metropolitan National Bank, Minneapolis, Minn. (Hewitt and Brown, architects), was a building which was essentially "modern" in its architectural rendering, without being unpleasantly eccentric. The Greenwich Trust Co., Greenwich, Conn. (A. C. Bossom, architect), is agreeably conservative, and the Phoenix Insurance Building, Hartford, Conn. (Benj. W. Morris, architect), was a pleasing departure from the usual "classic," being designed in brick-and-stone Georgian manner of old Philadelphia.

**MUSEUMS AND LIBRARIES.** One of the most interesting museums, and one which was commendably appropriate in style to its locality was the Southwest Museum, Los Angeles, Cal. (Sumner and Hunt and S. R. Burns, architects). Crowning a hill, its mass suggested an old Spanish fortress, with low, square towers at either end. Such a utilization of the local style of the early Spanish missions of the Pacific Coast was a promising indication of the growing appreciation now apparent among Pacific Coast architects of the extensive possibilities of their unique architectural heritage. In Cleveland, O., a new Art Museum was completed (Hubbell and Benes, architects)—a small, graceful Classic design of the Ionic order, in white marble. In New York City, constant additions were being made to the great Metropolitan Museum (Hunt and Hunt, architects), that in 1917 being a gallery designed by McKim, Mead and White, architects. In San Francisco, Cal., was seen a large new Public Library building in a pleasing adaptation of Italian Renaissance style.

**HOTELS AND APARTMENTS.** In New York City two hotels of major importance were under construction, to be completed during 1918: The Pennsylvania (McKim, Mead, and White, architects), mentioned in the YEAR BOOK of 1916, and the Commodore (Warren and Wetmore, architects), a large hotel of design similar to the Biltmore, and forming a part of the extensive group known as "the Grand Central development," in connection with the Grand Central Terminal on Forty-second Street. During 1918 an important part of the Grand Central Terminal plan was to be completed, namely the traffic bridge spanning Forty-second Street and Fourth Avenue, and connecting the grade at Fourth Avenue and Fortieth Street with the raised terrace of the Terminal. The purpose of this bridge, upon which work was commenced in 1917, was to relieve the traffic congestion at this point by diverting all vehicular traffic connected with the Terminal from Forty-second Street.

A few blocks above the Grand Central Terminal the palatial Hotel Chatham (Warren and Wetmore, architects) was nearly completed, designed in an adaptation of the Adam style successfully employed by the same architects in the Ritz Hotel, or Carlton House, nearby. Almost completed and ready for opening in 1918

were two new Statler Hotels (Geo. B. Post, architect: Russell and Crowell, Associated), in Cleveland, O., and St. Louis, Mo., typical modern American hotels operated under a highly efficient centralized management. Among the most interesting of hotels in the United States was the Hotel Traymore, at Atlantic City, N. J. (Price and McLanahan, architects), a colossal seashore resort hotel, of steel and concrete construction, and strikingly original design.

Additions to New York City apartment houses showed little departure from the developments of recent years, the past decade ended in 1917 having witnessed a remarkable advance in architectural merit over earlier efforts. The Apartment House Medal, awarded annually by the New York Chapter of the American Institute of Architects, went to a dignified apartment house of Italian Renaissance design (J. E. R. Carpenter, architect) at Fifth Avenue and Seventy-second Street. Chicago was fortunate in that much of its apartment house development had taken place in an era of far greater architectural enlightenment than that of the first apartments in New York. In Boston one of the most attractive of recent apartment house designs was seen in West Hill Place (Coolidge and Carlson, architects), an admirable rendering of the earliest brick-and-stone style of the older Boston residence. The effect was one of far more pronounced domesticity than is usually expressed in apartment house design, added to which was the desirable element of local suitability.

**RESIDENTIAL ARCHITECTURE.** A few important city houses in New York are worthy of note, and a survey of the entire country would reveal no architectural tendencies of a nature which would contradict the prevalent eclecticism seen in all residential architecture in this country. One of the most impressive of recent city houses was that of Arthur Curtis James (Allen and Collins, architects) in New York City. The entrance hall was essentially Byzantine, recalling the old Tiffany house, and H. H. Richardson's "Romanesque Revival." The most notable interior was the vast Gothic living hall, with hooded fireplace, open timber ceiling and tapestried walls. The dining-room was elaborately Georgian.

An interesting city house, and one expressing rather more of a spirit of domesticity than most, was the house of Reginald De Koven (John Russell Pope, architect), its façade diversified by mullioned bays with casement windows, pleasantly Jacobean, with interiors carried out in the same vein. The most notable city house of Italian Renaissance character was that of J. T. Pratt (C. A. Platt, architect), and the residence of L. Ledyard Blair (Thomas Hastings, architect) presented a study in a dignified, almost severe type of Classic Renaissance.

It would be impossible in the limited compass of this review to give more than passing mention of country house design, which presents to the observer no tendencies differing from those outlined in the YEAR BOOK of 1916. One of the most conspicuous country houses of the year was certainly that of Mr. Deering, at Miami, Florida (Paul Chalfin, architect). Here a great seashore estate, called "Vizcaya," has been developed in the manner of the country places of Renaissance Italy, with elaborate gar-

dens and a palatial villa. Considering the magnitude of the whole project, the architectural merit of its handling might be pronounced highly successful, combining, as it did, the incorporation of many imported antique fragments with new design. Few country estates in America represented nearly so great an expenditure, in buildings, gardening, or interior decoration as were combined in "Vizcaya."

Another stately Italian country house (geographically misplaced at Cohasset, Mass.) was "Torrebianca" (George F. Newton, architect), and still another, more appropriately located, is the country house of I. Waldron Gillespie, at Montecito, Cal. (Cram, Goodhue, and Ferguson, architects). Italian and Spanish styles for country houses were growing increasingly popular on the Pacific Coast, a notable design in pure Spanish being the newly completed Blaney residence (Willis Polk, architect). The Spanish Mission style, too, was receiving more architectural appreciation than formerly, as evidenced in certain far Western buildings for schools and museums, and, specifically, in an interesting country house for D. H. Robert, at Coronado, Cal. (W. Templeton Johnson, architect).

The characteristic "Southern Manor" type was seen in the admirable country house for R. C. Plater, at Nashville, Tenn. (C. A. Platt, architect), and many diverse architectural expressions, as in recent years, were added to the recognized diversity of our country house architects by such prominent designers as Harrie T. Lindeberg, Delano and Aldrich, Lewis C. Albro, John Russell Pope, and Walker and Gillette.

Real estate developments, in which groups of houses of moderate size were planned to constitute a unified design, received successful attention at the hands of country house architects in several localities. The vicinity of Philadelphia, Pa., was especially fortunate in this respect, with Pastorius Park and Linden Court, largely carried out by Edmund B. Gilchrist, architect, and the Half-Moon Group, by Duhring, Okie, and Ziegler, architects, to whose credit were also a number of the best small country houses which have been designed in recent years. At Lake Forest, Ill. (near Chicago), Howard Shaw, architect, designed an interesting group of houses and community buildings not dissimilar from those at Forest Hills Gardens, near New York, largely designed by Grosvenor Atterbury, architect.

**CHURCH AND MEMORIAL ARCHITECTURE.** The most important church edifice of current architectural interest is the Cathedral of St. John the Divine, on Morningside Heights, in New York City, at present under the architectural direction of Ralph Adams Cram (formerly of the firm of Cram, Goodhue, and Ferguson). Elaborate scale models for the nave have been prepared, and after years of discussion as to whether or not the Byzantine style originally planned by Heins and La Farge should be carried on, it was announced that the nave was to be "exactly and explicitly Gothic," and while not patterned after any European prototype, would suggest the naves of Le Nans and Bourges Cathedrals in France. Mr. Cram stated a belief that the world might enjoy an era not unlike that of the great cathedral builders after the war, and his architectural convictions

with regard to the Cathedral of St. John the Divine were but a part of his general convictions as to the permanent desirability of the Gothic Ideal.

While actual work on the great nave was not in progress at the end of the year, two chapels, radiating from the ambulatory, the Chapels of St. James, and St. Boniface (the late Henry Vaughan, architect) had been completed.

The architectural tendency toward the Romanesque style for church edifices, noted last year, appears to be growing stronger, conspicuous examples being the Church of St. Agnes, Cleveland, O. (John T. Comes, architect); St. Mary's Church (R. C.), Akron, O. (E. T. P. Graham, architect); and the Church of St. Gregory (R. C.), Brooklyn, N. Y. (Helmle and Corbett, architects). An interesting feature of the last-named is seen in the *fresco buono* decorations by Maximilian F. Friederang, carried out in the technique of Renaissance Italy, now almost a lost art.

An architectural manner approaching more nearly than anything else "English Domestic" was seen in two interesting church buildings in New Jersey: Holy Trinity Rectory, at Hackensack (Raphael Hume, architect) and Trinity Parish House, at Newark (Upjohn and Conoble, architects). Among small churches, a distinctively primitive and rugged style, suggesting the ancient Parish Churches of Ireland, was most successfully employed in St. Brigid's Church (R. C.), at Westbury, L. I.

One of the most notable memorials of the year was the Mary Baker Eddy Memorial (E. T. Swartwout, architect), erected by the Christian Scientists at Mt. Auburn Cemetery, Cambridge, Mass. The design consisted of a simple, circular hypethral temple, upon a Classic base, the detail both strong and restrained, and the unusual combination of a palmette capital on a baseless Doric shaft was remarkably well managed. Three private Mausoleums are well worthy of note: the Stewart Mausoleum (John Russell Pope, architect), the Jules Bahe Mausoleum (Davis, McGrath, and Kiessling, architects), both at Woodlawn Cemetery, N. Y., and a Mausoleum in Holy Cross Cemetery, Delaware County, Pa. (John T. Windrim, architect).

**COMMERCIAL ARCHITECTURE.** The tall office buildings in which New York City is already unique among cities of the world counted one addition during 1917 which was of conspicuous and unusual architectural merit. This was the Bush Terminal Building, on West Forty-second Street (Helmle and Corbett, architects), a splendid Gothic tower of brick and terra cotta, excellently designed in both mass and detail. There should be no hesitation in according it a permanent place among the most impressive solutions of the tall building problem in this country, for the traditional forms of the Gothic style have been adopted for use in an essentially modern building in a manner which is both sympathetic and forceful.

The Heckscher Building (Jardine, Hill, and Murdoch, architects) and the Postal Life (York and Sawyer, architects), both mentioned in the YEAR BOOK of 1916, were both completed during 1917, and formed important additions to New York's larger office buildings in the uptown district. Two large New York office buildings of the twin-tower type were the Adams Express Building (Francis Kimball, architect), and the

American Express Company Building (Reawick, Aspinwall, and Tucker, architects), both important additions to metropolitan commercial architecture, but neither showing any new developments in design.

One of the most unusual of all New York office buildings was a small two-story structure in downtown New York for Culman Brothers (Aymar Embury II, architect), designed in the most refined and restrained kind of Georgian Colonial, of red brick, with white trim. A few attractive store buildings were finished in New York during 1917, but none of great importance in either design or size, excepting the Abercrombie and Fitch Building (Starrett and Van Vleck, architects).

Barely within the realm of "commercial architecture" was the Chalf Dancing Academy Building, in New York City (G. A. and Henry Boehm, architects), a graceful façade of well-disposed brick and colored terra cotta, freely Italian in general character. More stylistically Italian, in the "Florentine Gothic" manner, was the building for Mehlin pianos (Andrew J. Thomas, architect). An interesting bit of commercial architecture in Chicago, Ill., was the Edison Shop (Purcell and Elmalie, architects), indicating by its distinctly modernistic handling that the "Secessionist" school of Middle Western architecture, started by Louis Sullivan and carried on by Frank Lloyd Wright, was by no means dead.

The Union Arcade Building, in Pittsburg, Pa. (F. W. Osterling, architect), was a large "business block" which impressed by reason of its size rather than the architectural success with which its conventional Gothic style is rendered.

**CLUBS.** The year 1917 witnessed the erection of fewer club buildings than many previous years, perhaps the architecturally notable one in New York City being the Links Club (Cross and Cross, architects), a design consistently Georgian, exterior and interior, the former well detailed in brick and limestone, the latter equally well detailed, and furnished with commendable taste and expression. The Elks Club, in Detroit, Mich. (Van Leyen and Schilling, architects), was conventional in character, and showed some influence of the Adam adaptations in recent hotels designed by Warren and Wetmore, especially in the treatment of the interiors. There was considerably more architectural character in the Women's Athletic Club, San Francisco, Cal. (Bliss and Faville, architects), a building skilfully and colloquially designed in brick.

A notable country club was seen in the Knickerbocker, at Tenafly, N. J. (Aymar Embury II, architect), the free rendering of the local Dutch Colonial style, modified to meet the requirements, effecting right expression of informality for a building of this type. At Corsicana, Tex., a large Y. M. C. A. Building (Shattuck and Hussey, architects) was successfully designed in the Spanish Mission style, bearing out the comment elsewhere in this review to the effect that this native stylistic inheritance has, during the past year, gained considerable popularity in the West and Southwest. It was seen again as the style selected for an important passenger station (Bakewell and Brown, architects), on the Santa Fé Railroad at San Diego, Cal.

Among buildings of conspicuous architectural

CATHEDRAL OF SAINT JOHN THE DIVINE

merit which do not come under any of the classifications covered above were two excellent examples of design in brick. One of these was the bird house for the Zoölogical Society of Philadelphia (Mellor and Meigs, architects); the other the Administration Building of the Essex County Park Commission, at Newark, N. J. (H. Van Buren Magonigle, architect). Both were colloquial studies in Italian Renaissance, with central Palladian features, the Palladian loggia of the bird house being effectively reflected in the waters of a small lake upon which it is situated.

**EUROPEAN ARCHITECTURE.** Inspiring evidence comes to us from France that the government, not entirely blinded by the dark cloud of war, was assiduously collecting all available drawings and photographs of typical northern French buildings, in order to preserve, when the era of restoration commences, the old, picturesque architectural character of the devastated region. Private individuals, artists, architectural students, and draughtsmen, all were contributing whatever material they had, and from these documents certain French architects were developing working drawings for houses, market-places, city halls, blocks, and whole streets of buildings which would, when erected, do much to repair the ravages of war. That the picturesque character of the old buildings is to be adhered to as the dominant theme of the new villages which will rise over the ruins of the old was but a reassuring evidence that the French had lost none of their fine and sympathetic artistic instincts of fitness and romance.

In England, preoccupation with the war, together with a great diversion of architects in active service, had considerably checked architecture. As in the United States, however, many people had been enriched by the war far beyond their normal expectations, even without "profiteering," so that the erection of country houses had by no means ceased. The problem in this type of building consisted of shortage in labor and materials rather than in any financial stringency.

English architectural periodicals were taken up extensively with photographs of the ruined architectural monuments of Belgium and France, and with controversies and data relative to the effects of explosion and shock upon different types of construction. As an instance, buildings in the vicinity of a considerable munition plant explosion were carefully examined, and it was found that buildings of brick, even a quarter of a mile distant, suffered seriously, sheds which were open at either end were but little damaged, and structures of reinforced concrete were virtually unhurt. As a means of meeting the labor and material problem, English architects and engineers were experimenting with the possibility of reinforced concrete units to take the place of steel and lumber, and the results of these experiments will be of great interest when they become known.

In Germany the cessation of architectural activity may be somewhat conjectured from the statement of an American returned from Berlin, who stated that in that busy and once prosperous capital alone there were from 100,000 to 125,000 vacant dwellings and stores as against 10,000 to 16,000 in times of peace.

By all means the most interesting and inspiring architectural news from Europe was

that of the splendid plans of the French government, which, without arrogantly boasting of its "efficiency" or "*kultur*," was quietly but systematically collecting the material which would make possible a real architectural restoration of the incomparably picturesque spots which an enemy "efficiency" and "*kultur*" had destroyed. See CITY PLANNING.

**ARCTIC EXPEDITIONS.** See POLAR RESEARCH.

**ARGENTINA.** A federal republic of southern South America. It is called officially *la República Argentina* (the Argentine Republic) and *la Nación Argentina* (the Argentine Nation). The capital is Buenos Aires.

**AREA AND POPULATION.** The Argentine Republic consists of fourteen provinces, ten territories, and the Federal district. Estimates of the republic's area differ considerably; the one at present most acceptable is 2,987,356 square kilometres (1,153,417 square miles). This area is about 38.1 per cent of the area of continental United States (that is, exclusive of Alaska). The population at the census of June 1, 1914, was 7,885,237 (about 6.84 per square mile), as compared with 4,045,000 in 1895. The census of 1895 showed 3,954,911 inhabitants, but it was estimated that some 30,000 Indians and 60,000 other persons were not recorded. The area and the population, according to the 1895 census and the census of June 1, 1914, are reported as follows:

Provinces	Sq. km.	Population	
		1895	1914
Federal District ...	186	663,854	1,576,597
Buenos Aires .....	805,121	921,168	2,066,165
Santa Fé .....	131,382	397,188	899,640
Entre Ríos .....	75,754	292,019	425,373
Corrientes .....	86,879	239,618	347,055
Córdoba .....	173,349	351,223	735,472
San Luis .....	75,219	81,450	116,266
Santiago del Estero ..	143,484	161,502	261,678
Mendoza .....	146,378	116,186	277,585
San Juan .....	98,096	84,251	119,252
La Rioja .....	98,080	69,502	79,754
Catamarca .....	95,337	90,161	100,391
Tucumán .....	27,000	215,742	332,933
Salta .....	125,184	118,015	140,927
Jujuy .....	38,347	49,718	76,631
Total .....	1,619,696	3,851,542	7,526,499
Territories .....	1,367,660	108,369	358,738
Grand total ...	2,987,356	3,954,911	7,885,237

In 1914, males numbered 4,227,023, females 3,658,214; Argentine males 2,753,214, females 2,774,071; foreign males 1,473,809, females 884,143. The total number of Argentines (including children of foreign parentage and 33,219 naturalized citizens) was 5,527,285; foreigners numbered 2,357,952 (of whom 777,845 were in the Federal district). An estimate of the number of inhabitants in 1916 is 8,988,383; but this, like most estimates of Argentine population, is undoubtedly too high.

The largest city of Argentina is the capital, Buenos Aires, which is also the largest city of the Southern Hemisphere and, after Paris, the largest Latin city of the world. It is coextensive with the Federal district, having an area of 18,854 hectares, equivalent to 46,589 acres or about 72.8 square miles. The perimeter of the city is nearly 39 miles. The Río de la Plata at Buenos Aires is about 28 miles wide. The city's estimated number of inhabitants in 1917 was 1,700,000, but this figure may be somewhat excessive. The enumeration of 1909 showed

a population of 1,231,698, of whom 561,985 were of foreign birth. Of these, Italians numbered 277,041; Spaniards, 174,291; Uruguayans, 26,784; French, 25,751; Germans, 7444; British, 7113. The development of Buenos Aires into one of the largest and most splendid cities of the world has been very rapid. Its population increased from 76,000 in 1852 to 140,000 in 1864, 404,000 in 1887, and 800,000 in 1900; since the latter year it has more than doubled. The city's rapid growth is due not alone to the constant influx of immigrants; the natural increase is very large, the birth rate in 1913 being 34.16 and the death rate 15.5. The second largest city of Argentina is Rosario, in Santa Fé, with approximately 250,000 inhabitants. Recent population figures for other cities: Córdoba, 135,000; La Plata, 119,000; Avellaneda, 105,500; Tucumán, 100,000; Bahía Blanca, 75,000; Mendoza, 62,000; Santa Fé, 60,000; Paraná, 36,000; Salta, 33,600.

**EDUCATION.** Education, which is supported by the national and provincial governments and is promoted by many private institutions, is more generally diffused than in some Latin-American countries, and public primary instruction is free, secular, and nominally compulsory between the ages of six and fourteen; but of the population above six years about one-half remains illiterate. In 1913 the reported population of school age was about 1,275,500, of whom some 804,000 were in school attendance. For secondary instruction the national government maintains 30 colleges (about 8800 students), and there are 38 private institutions of the same grade (about 3200 students). Normal schools number 67 (6600 students), and schools for special instruction 34 (6600 students). There are five universities, three national and two provincial. The national universities are: Buenos Aires, with 4364 students in 1915; La Plata, 2184; Córdoba, 584. The provincial universities are Santa Fé and Tucumán. In 1916 the University of Buenos Aires and its affiliated schools had an enrollment of about 9000 students. There is no state religion, but the Roman Catholic Church receives government support.

**PRODUCTION.** The principal sources of wealth are agriculture and stock raising. Mining has been little developed. The leading industrial business is meat-packing, in the region of the Río de la Plata. Besides flour and preserved meats, manufactures include butter, cheese, sugar, wine, quebracho extract, and textile goods. The flour mills of the city of Buenos Aires and of the provinces of Santa Fé, Córdoba, and Entre Ríos produce about 94 per cent of the total wheat flour output. In 1914 wheat flour production amounted to 908,361 metric tons and the export thereof 67,325 tons; in 1915, 937,770 and 116,049; in 1916, 993,539 and 144,290. In the early part of 1917 there was crop failure and general shortage in Argentina perhaps beyond anything hitherto experienced. Not only was there a smaller area under crop than in the preceding year, but drouth reduced the yield enormously. The following table shows in hectares the area of the principal grain crops in 1915-16 and (preliminary figures) 1916-17, the average for the five-year period 1909-10 to 1913-14, and the percentage of the 1916-17 crop on the average crop for the five-year period:

	Area in hectares			Percentage
	1915-16	1916-17	5-year av.	
Wheat .....	6,645,000	6,511,000	6,495,744	100.2
Rye .....	85,600	72,760	34,308	212.1
Barley .....	174,500	157,050	93,085	168.8
Oats .....	1,038,000	1,022,000	969,714	105.4
Corn .....	4,018,850	3,629,570	3,524,850	103.0
Linseed ....	1,619,000	1,298,000	1,565,484	82.9

Corresponding figures for productions, in metric quintals, are shown below:

	Production in metric quintals			Percentage
	1915-16	1916-17	5-year av.	
Wheat ....	46,988,000	21,063,200	40,528,152	52.0
Rye .....	510,000	218,000	355,325	61.4
Barley ...	1,400,000	471,000	956,937	49.2
Oats .....	10,927,000	4,878,500	8,118,186	60.1
Corn .....	40,980,000	.....	48,694,000	...
Linseed ..	9,974,000	1,841,200	8,018,534	16.7

Preliminary figures for the 1917-18 planting showed considerable increases. Number of live stock as reported for 1916: horses, 9,336,445; mules, 583,965; asses, 345,181; cattle, 30,796,447; sheep, 81,185,149; goats, 197,387; swine, 3,197,337.

**COMMERCE.** The course of Argentine foreign trade in merchandise is shown below in thousands of pesos gold:

	1906	1913	1914	1915	1916
Imports ..	269,971	421,353	271,818	226,893	217,409
Exports ..	292,254	483,505	349,254	558,281	543,346

The figures here given represent valuations according to customs house appraisements. According to estimates made by the General Office of Statistics of Argentina, true values exceed the statistical values given by the following percentages: 1913, imports 17.7 and exports 7.4; 1914, 18.6 and 15.4; 1915, 34.6 and 4.3; 1916, 68.4 and 5.5.

Principal classified imports, in thousands of pesos gold, in 1915 and 1916 respectively: textiles and manufactures thereof, 51,985 and 65,592; food products, 22,556 and 26,007; iron and steel and manufactures thereof, 18,646 and 20,993; earth, stone, glass, coal, etc., 19,890 and 19,309; oils, grease, etc., 36,140 and 15,679; chemicals and pharmaceutical products 10,590 and 12,497; timber, wood, straw, and manufactures thereof, 4212 and 9383; metals (other than iron and steel) and manufactures thereof, 5870 and 7391; paper and manufactures thereof, 5823 and 7237.

Argentine exports are classified under six general heads. These are shown below, in thousands of pesos gold:

	1913	1914	1915	1916
Live animals and meat products.	165,800	151,746	218,780	270,391
Agricultural products .....	301,267	184,367	312,884	244,132
Forest products ..	10,618	9,239	19,012	22,452
Mining products ..	195	84	180	1,192
Hunting and fishing .....	1,817	1,320	2,045	1,446
Miscellaneous ...	3,808	2,498	5,380	3,733
Total .....	483,505	349,254	558,281	543,346
Value in thousands of dollars.	468,999	338,777	541,582	527,045

The table following shows some of the more important articles of exports in 1915 and 1916, values in thousands of pesos:

	1915		1916	
	Quantity	1,000 pesos	Quantity	1,000 pesos
Beef cattle..no.	103,207	3,101	51,919	1,558
Horses ..no.	52,163	4,863	28,314	3,207
Frozen beef... tons	351,036	73,718	411,547	93,010
Chilled beef... tons	11,703	2,458	16,153	3,651
Frozen mutton .. tons	35,035	6,306	51,318	9,468
Salt sheepskins .. tons	1,236	247	1,797	398
Unwashed sheepskins . tons	20,225	6,806	14,551	6,076
Salt cattle hides .. tons	64,248	27,483	77,841	38,399
Flint cattle hides .. tons	25,579	15,290	21,549	16,254
Unwashed wool .. tons	117,870	55,579	171,657	64,278
Washed wool .. tons	.....	.....	3,902	1,951
Canned meat .. tons	31,944	3,194	44,569	4,457
Rendered tallow and grease .. tons	49,866	7,765	48,685	9,316
Oats .. tons	592,797	19,066	804,443	17,627
Linseed .. tons	981,192	46,101	639,914	37,727
Corn .. tons	4,380,594	93,475	2,873,910	73,845
Wheat .. tons	2,511,514	132,632	2,294,876	96,621
Wheat flour .. tons	116,049	10,072	144,290	9,833
Quebracho logs .. tons	209,679	2,684	161,784	2,322
Quebracho extract .. tons	100,213	15,873	95,547	19,663

Imports of merchandise by principal countries have been as follows, in thousands of pesos gold:

	1913	1914	1915	1916
United States....	62,033	36,684	56,159	63,532
United Kingdom...	130,887	92,475	67,782	61,285
Italy .....	34,790	24,872	21,168	21,388
France .....	88,076	22,894	13,311	14,999

\* The exports "for orders" are not recorded at Argentine ports as for specific countries, but are subject to cable or other orders for final destination.

Trade by principal ports was as follows in 1916, in thousands of pesos: Buenos Aires, imports 183,401 and exports 272,731; Rosario, 13,474 and 62,187; Campana, 9770 and 23,400; La Plata, 4257 and 52,531; Bahía Blanca, 3229 and 48,367; Zárate, 1517 and 16,578; Santa Fé, 390 and 11,024.

COMMUNICATIONS. The natural tendency of the railway in Argentina has been to converge from the interior to certain eastern ports. Buenos Aires has always been the principal terminal, but Santa Fé and Rosario on the Paraná, and Bahía Blanca to the south on the Atlantic, are important foci of commerce, the shipping facilities being increased to meet the growing traffic. The Province of Buenos Aires is relatively well supplied with lines, Santa Fé and Córdoba being next in this regard. Every political division except Los Andes and Tierra del Fuego has at least one line built or building. With over 22,000 miles of railway, Argentina ranks ninth among the countries of the world, being surpassed by the United States, Germany, Russia, France, India, Great Britain, Austria-Hungary, and Canada.

In 1917 there were in operation from Buenos Aires as a centre 22,688 miles of railway in Argentina. In the steam railway construction, there had been heavy investment by British capital, and in the electrical street railways prior to the war much German capital had been interested. In April the completion of the Patagonian Railway from San Antonio to Lake Nahuel Huapi in the territories of the Rio Negro was planned, while in addition the government contemplated additional lines to open up the territories of Rio Negro, Chubut, and Santa Cruz, all of which had rich agricultural, mineral, and other resources. The government oil fields of Comodoro Rivadavia supplied fuel oil for operation. The railways in the Argentine are subject to the supervision of the Minister of Public Works, who acts through the Direccion General de Ferrocarriles, whose powers are provided in the Mitre Law of 1907. In addition to the steam railways, there were 750 kilometres of electric street railways in Buenos Aires. In 1917, an American syndicate took over \$15,000,000 of 6 per cent bonds of the Argentine railways and in the previous year \$50,000,000 of Argentine railway stock had been transferred from British to American capitalists.

During the year the railways of Argentina were permitted to increase their rates to cover the increase in wages granted after the recent strike, in addition to the 22 per cent increase in rates granted to cover the higher operating costs, the chief item in which was the cost of coal. While the crops for the year were excellent, it was feared by the railway managers

that the roads would not benefit therefrom to any marked degree owing to the shortage of ocean tonnage.

Telegraph lines, as reported for 1915, aggregated 43,153 miles (of which national lines, 23,978 miles), with 131,586 miles of wire and about 2600 offices. Radiotelegraph stations, 20. Post offices numbered 3431 at the end of 1915.

**FINANCE.** Argentina's monetary unit is the peso (gold), equivalent to 5 francs, or 96.475 cents. Under the conversion law of 1899, the paper peso is current with a value of 44 per cent of the monetary unit, or 42.449 cents. National revenue and expenditure are reported as follows, in thousands of pesos gold:

	1911	1912	1913	1914	1915
Revenue ..	136,683	148,002	153,692	110,080	101,811
Expend. ..	183,291	211,108	177,513	184,641	175,969

The great decline in imports in consequence of the world war has caused a corresponding diminution of import duties, which are by far the largest item of revenue. The budget for 1916 showed an expenditure of 392,870,745 pesos paper, and the revenue was 363,311,775 pesos paper. The budget for 1917 fixed the expenditure at 385,907,701 pesos paper.

The public debt of Argentina in 1900 amounted to 452,488,062 pesos gold; in 1905, 394,253,124; in 1910, 476,739,862; in 1915, 537,582,830. The debt in 1915 consisted of the consolidated debt (external and internal) of 463,146,560 pesos gold and 169,173,340 pesos paper.

**NAVY.** The Argentine navy includes two of the world's large battleships, the *Rivadavia* and the *Moreno*, both launched in the United States in 1911. Each of these has a displacement of about 28,000 tons, 32,500 indicated horsepower, nominal speed of 22.5 knots, 10-inch armor belt, a main battery of 12 12-inch guns, and 12 6-inch guns and 16 4-inch guns. Other vessels include: 1 old coast guard (1880), 4200 tons; 2 old coast guards (1890 and 1891), 4600 tons; 4 armored cruisers, *Garibaldi* (1896), *San Martin* (1897), *Belgrano* (1898), *Pueyrredon* (1898), aggregating 27,400 tons; 3 old protected cruisers, *Twenty-fifth of May* (1890), *Ninth of July* (1892), and *Buenos Aires* (1895), aggregating 11,620 tons; several torpedo-boat destroyers, torpedo boats, river gunboats, etc.

**GOVERNMENT.** Argentina is one of the five American republics which have the federal form of government, the others being the United States, Brazil, Mexico, and Venezuela. The legislative power is exercised by a congress of two houses, the Senate and the Chamber of Deputies. Senators (30 in number, 2 from each province and the Federal District) are elected for nine years by the provincial legislatures and, in the Federal District, by a special body of electors. Deputies (120) are elected for four years by direct vote. The executive authority is vested in a president, who, with a vice-president, is elected for six years by indirect vote and is ineligible for the next term. The president is assisted by a cabinet of eight members. The president in 1917 was Hipólito Irigoyen, who was inaugurated October 12, 1916; vice-president, Pelagio Luna.

**HISTORY.** On January 30 the resignation of the Minister of Foreign Affairs, Carlos Becu, was announced. He had been appointed on Octo-

ber 12, 1916. On February 9 the government's reply to Germany's notice of the submarine blockade was reported. The Argentine note which was handed to the German minister at the capital declared the government's regret that Germany had taken so extreme a course and that Argentina would insist on conformity to the principles of international law. An extraordinary session was called on January 26 to pass the budget estimates. The budget committee recommended an expenditure of \$360,000,000 of Argentine paper money. To this the claims of Deputies added about \$20,000,000, bringing the total budget to about \$380,000,000 or approximately \$167,000,000 in United States money. While this was lower than the previous budgets since 1913 it did not provide for the deficits which had been each year as high as \$63,000,000 in United States money.

In April it appeared from the press that the financial situation was extremely serious as a result not only of the European war but of an internal crisis following the failure of the crops. The falling off of the importations had so reduced the customs receipts that the government was obliged to resort to frequent loans to meet expenses. The bank deposits continued to increase while the discounts did not increase in anything like the same proportion and an attempt was made to drive the money into the market by reducing the interest. The government was obliged to renew its debt to meet interest charges and was harassed by the difficulty of finding means of meeting the frequently expiring short time loans. On April 10 the Argentine government presented a note to the American ambassador recognizing the justice of the American attitude and characterizing the German submarine campaign as an attack on the rights of humanity. A large element in the country was now urging the government to follow the same course as the United States.

During the month of April Argentina seemed on the verge of war with Germany. Early in the month the German minister informed the Argentine government that Germany was ready to finance the public works in Argentina. The Argentine vessel *Monte Protegido* was sunk off the European coast by a German submarine and one man in the crew was wounded. This caused hostile demonstrations against Germany in Buenos Aires and the government on April 21 sent a note to Germany demanding complete satisfaction. Meanwhile there had been friction between the two countries as a result of Argentina's placing the German ships in Argentine waters under the supervision of armed guards. Against this Germany had protested but it had been explained officially that it had been done simply to safeguard the destruction of the vessels, the authorities saying that the German crews had not only damaged the machinery to such an extent that it was useless but had bored holes in the hulls of the vessels in order that they might be sunk when the chance presented itself. As to the sinking of the *Monte Protegido* the Argentine minister was instructed to break off relations with Germany if the German government tried to evade the responsibility, but early in May it was announced that the government had received a note from Germany expressing regret for the sinking of the vessel and in view of the fact that the vessel had started on its voyage too early to

have heard about the new German measures of submarine warfare the German government was disposed to make reparation. The council of ministers decided that the controversy was closed. On April 28 the National Socialist congress opened its sessions at Buenos Aires. The party was divided on the question of the war, one favoring neutrality and the other wishing to join the Allies. A resolution submitted to the congress by its executive committee to the effect that German submarine methods violated international law and that Argentine vessels ought to be armed was rejected by a vote of 3557 to 2510, and the congress adopted a resolution declaring for neutrality. A difficulty with the German government again arose over the sinking of the Argentine steamship the *Foro*, and it was reported on August 5 that the Argentine government had broken off negotiations with the German minister and had sent a final note to Berlin requiring a definite answer to the Argentine demands within a reasonable length of time. On August 23 Germany replied with a pledge that she would abstain henceforth from torpedoing Argentine vessels. Early in October Germany pledged herself to recognize the Argentine flag and respect the nation and the people, and on October 9 the Foreign Office declared that relations would not be broken off so long as this promise was kept. Nevertheless the war party was strong and the conflict between it and those who favored neutrality was exceedingly bitter throughout the country. Both Houses of Congress voted for the breaking off of relations. Another cause of disturbance was a railway strike embracing the whole system. It resulted in the concession of the strikers' demands.

See UNITED STATES AND THE WAR.

**ARIZONA. POPULATION.** The estimated population of the State in 1910 was 204,354, and on July 1, 1917, it was 263,788.

**AGRICULTURE.** The average production and value of the principal crops as estimated by the United States Department of Agriculture in 1916-17 were as follows:

		Average	Prod. Bu.	Value
Corn .....	1917	32,000	864,000	\$1,642,000
	1916	22,000	770,000	1,078,000
Wheat .....	1917	33,000	825,000	1,782,000
	1916	40,000	1,160,000	1,740,000
Oats .....	1917	10,000	400,000	884,000
	1916	9,000	338,000	270,000

Cotton .....	1917	39,000	b 24,000	3,324,000
	1916	.....	.....	.....

a Tons. b Bales of 500 pounds gross weight.

**MINERAL PRODUCTION.** The output of gold, silver, copper, lead, and zinc in the State in 1916 was valued at \$190,806,170, an increase of \$99,999,821 over 1915. The increases are 261,860,874 pounds in copper, 5,323,118 pounds in lead, and 1,457,086 pounds in zinc. The output of gold decreased \$180,466, but the production of silver surpassed all previous records. It amounted to 7,212,039 ounces. Arizona is the leading copper-producing State, and had an output for 1916 of 721,833,169 pounds, an increase over the previous year of 261,860,874 pounds, and in value \$97,075,808. The output of lead increased 5,323,118 pounds in 1916. The

production of zinc increased to 19,877,949 pounds.

The output of gold, silver, copper, lead, and zinc in the mines of the State in 1917, had a total value of over \$214,000,000, according to the estimates of the United States Geological Survey. This is the record production of the State, and may be compared with the value of \$190,806,170 in 1916. The higher prices of the metals were responsible in part for this increase. The production of gold increased from \$3,985,599 in 1916 to approximately \$4,831,000 in 1917. The production of silver decreased from 7,212,039 ounces in 1916 to about 6,254,000 ounces in 1917. As the market value was much higher, the average being 81.4, the value increased from \$4,745,522 to about \$5,000,000. The mined output of copper decreased from 721,833,169 pounds in 1916 to approximately 688,000,000 in 1917. The value of the output increased from \$177,570,960 in 1916 to over \$200,000,000, in 1917. The mined output of lead decreased from 27,062,087 pounds in 1916 to about 18,000,000 in 1917, but as the price was better, the value was only slightly less than that of 1916, which was \$1,867,284. The production of zinc increased from 19,877,949 pounds in 1916, valued at \$2,636,845, to about 20,700,000 pounds in 1917.

**EDUCATION.** The total school population in 1917 was 68,731. The enrollment in the public schools was 55,702, with the average daily attendance of 36,788. The number of teachers, male and female, was 1676. The average monthly salary of males was \$126.82, and that of females \$106.36. The total expenditure for school purposes was \$2,142,948.

**CHARITIES AND CORRECTIONS.** The charitable and correctional institutions include the Arizona State Prison, the State Hospital for the Insane, the Home for the Aged and Infirm, Arizona Pioneers, and the State Industrial School.

**ELECTION OF GOVERNOR.** The election of governor in November, 1916, was so close, that a special recount was necessary. In the meantime, Governor G. W. P. Hunt, who was the Democratic nominee, refused to turn his office over to Thomas E. Campbell, who, on the face of the returns, had been elected. On January 1, the date for the inauguration, Governor Hunt prevented Campbell from entering the capitol building, and the latter did not insist upon going through the formal ceremony. He had already taken the oath of office before a notary public, and he made an informal address to the people on the grounds of the capitol. Governor Hunt established a temporary executive office in another part of the city. The feeling was high on the part of the partisans of each side, but trouble was prevented by the presence of a large force of officers. On a special recount, Governor Campbell was declared elected, and Mr. Hunt withdrew further opposition. The Supreme Court in December revised the former opinion, and declared that Mr. Hunt had been elected.

On July 12 over 1200 striking miners in the vicinity of Bisbee were deported to New Mexico by armed citizens. The strikers were alleged to be members of the Industrial Workers of the World. See STRIKES.

**LEGISLATION.** Among the more important measures passed by the legislative session of 1917 are those noted below:

The laws relating to criminal procedure were

amended. Capital punishment was abolished as a result of a vote by the people. Laws relating to estates were also amended. Provision was made that a surviving wife may, without letters of administration, collect sums up to \$300 owed to the deceased husband as wages. The legislature petitioned Congress to extend the right of suffrage to women. A general prohibition law was enacted. This declared that intoxicating liquors "shall not be manufactured or introduced into the State of Arizona under any pretense." It was provided that the producers of food products on agricultural lands, farms, and gardens in the State shall never under any pretext be denied or restricted in the right to sell and dispose of the same except that it may be subject to uniform inspection by lawful authority. Provision was made for mothers' pensions.

**STATE OFFICERS.** Governor, \*Thomas E. Campbell; Secretary of State, Sidney P. Osborn; State Auditor, Jesse L. Boyce; State Treasurer, David L. Johnson; Attorney-General, Wiley E. Jones; Superintendent Public Instruction, C. O. Case—all Democrats except Governor, Rep.

**JUDICIARY.** Supreme Court: Chief Justice, Alfred Franklin; Associate Justices, D. L. Cunningham, Henry D. Ross; Clerk, Clay F. Leonard.

#### STATE LEGISLATURE.

	Senate	House	Joint Ballot
Democrats .....	14	31	45
Republicans .....	5	4	9
Dem. majority...	9	27	36

**ARIZONA, UNIVERSITY OF.** Situated at Tucson. Students in the fall of 1917 numbered 519, and there were 64 members of the faculty. Volumes in library, 27,000. Founded in 1885. Co-educational and State institution. Departments: college of letters, arts, and sciences, including, among others, law, education, music, agriculture (Agriculture Experiment Station), mines and engineering (State Bureau of Mines and Mines Experiment Station), extension. There is also a State Pure Food Laboratory and a State School for the Deaf and Dumb. President, Rufus Bernhard Klein Smid, A.M., Sc.D.

**ARKANSAS, POPULATION.** The estimated population of the State in 1910 was 1,574,449 and on July 1, 1917, it was 1,766,343.

**AGRICULTURE.** The acreage, production, and value of the principal crops according to estimates of the United States Department of Agriculture in 1916-17 were as follows:

	Acreage	Prod. Bu.	Value
Corn .... 1917	2,800,000	67,200,000	94,080,000
1916	2,550,000	45,185,000	44,282,000
Wheat ... 1917	210,000	3,860,000	6,754,000
1916	235,000	1,880,000	3,064,000

1916	2,600,000	1,134,000	111,135,000

a Tons. b Pounds. c Bales of 500 pounds gross weight.

\* See above.

**MINERAL PRODUCTION.** The coal production in the State in 1916 was 1,994,915 short tons, valued at \$3,836,845, as compared with 1,652,106 short tons, valued at \$2,950,456, in 1915. About 70 per cent of the total of the State is produced in Sebastian County. All counties showed increases in 1916. There were 3751 men employed in and about the coal mines in 1915, and 3772 in 1916. The lead and zinc mined in the State in 1916 were valued at \$1,863,956, compared with \$801,754 in 1915. The shipments of zinc carbonate and silicate in 1916 were exceeded only by those of Missouri. They amounted to 16,609 tons, valued at \$940,224. Arkansas is the leading State in production of bauxite, the ore of aluminum, the output in 1916 being 375,910 long tons, valued at \$2,011,590, compared with 268,796 tons in 1915, valued at \$1,370,489. Arkansas is also of importance as a source of manganese ores, shipping 6131 gross tons of high-grade ore in 1916, valued at \$176,995, compared with 588 tons in 1915, valued at \$10,013.

**FINANCE.** According to the report of the State Treasurer, the total receipts for the fiscal year of 1917 were \$5,396,685; the expenditures were \$4,430,314. There was a balance in the Treasury at the beginning of the year of \$487,037, and at the end \$1,453,408. The bonded debt of the State was \$2,000,500.

**EDUCATION.** The total school population in the State in 1917 was 658,706. There were enrolled in the schools 459,189, and the average daily attendance was 304,230. There were 4591 male and 6178 female teachers. The average monthly salary during the year was \$57.42. The total expenditures for school purposes amounted to \$4,450,714.

The legislature of 1917 passed a measure providing for compulsory school attendance. In connection with the provisions of this law, children between the ages of 7 and 15 must be sent to a public, private, or parochial school. The minimum session of attendance required under this act is three quarters of the session of the public school in the district in which the child resides.

**CHARITIES AND CORRECTIONS.** The charitable and correctional institutions include the State Hospital for Nervous Diseases, the State Penitentiary, the State Reform School, the Deaf Mute Institution, and the School for the Blind, all at Little Rock, and the Confederate Soldiers' Home, at Sweet Home.

**POLITICS AND GOVERNMENT.** The 1917 Arkansas legislature called a constitutional convention, which met on November 19, but after organizing and providing for the appointment of committees by its president, it adjourned until July, 1918. The present constitution was adopted in 1874. The legislature submitted two proposed constitutional amendments to be voted upon in 1918—one to increase the number of justices of the Supreme Court from five to seven and the other to provide a system of rural credits. It also passed an act authorizing the borrowing of \$750,000 by the State government. A "bone dry" amendment to the existing prohibition law was adopted, and the right to vote in primary elections was given to women. This was, in the main, equal to giving full suffrage to women qualified to vote in Democratic primaries, because the Democratic nomination, in the case of United States Senator,

member of Congress, governor, or other State officer, is equivalent to election, and this is true in the largest degree as to the remaining officers—judicial, legislative, county, and municipal—that are chosen by popular vote. Women voted in the Fort Smith and Little Rock municipal primaries. Educational measures passed by the legislature included a compulsory education law, an act placing all State educational institutions upon a millage tax basis, a uniform text-book law, and acts creating an illiteracy commission and granting State aid to rural high schools. Good roads legislation was enacted that enabled the State to receive its pro rata of highway funds under the Shackleford act. The system of property assessments was changed and many changes were made in various measures affecting corporations.

Up to December 20, Arkansas had furnished 21,844 men for service in the land and sea forces, as follows: navy, 1850; marine corps, 72; regular army, 2963; Arkansas National Guard, 6692; national army, 6525; negroes certified to national army and subject to immediate call, 3742. These figures do not include the new Fourth regiment.

The First and Second Arkansas Infantry were stationed at Deming, N. M., in the early part of the year and returned to Arkansas in February, being mustered out at Fort Logan H. Roots on February 22. Upon the declaration of war, the First Arkansas Infantry, composed of 15 organizations, was mustered into the service; and the Second and Third Arkansas Infantry, composed of fifteen organizations each, the Arkansas ammunition train, composed of fifteen organizations, and the Arkansas field hospital and Arkansas ambulance company were mustered in on August 5. These organizations were mobilized at Fort Logan H. Roots and were subsequently transferred to Camp Beauregard, La. In December the War Department gave authority for the raising of the Fourth Regiment and an Engineers' Battalion.

**STATE OFFICERS.** Governor, Charles H. Brough; Secretary of State, T. J. Terral; Treasurer, Rufus G. McDaniel; State Fire Marshal and Insurance Commissioner, B. F. Bullion; Attorney-General, J. D. Arbuckle; Superintendent of Education, J. L. Bond, Commissioner of Agriculture, J. H. Page; Commissioner of Public Lands, W. B. Owen—all Democrats.

**JUDICIARY.** Supreme Court: Chief Justice, Edgar A. McCulloch; Justices, F. G. Smith, C. D. Wood, T. Hayden Humphreys, and Jesse C. Hart; Clerk of the Court, W. P. Tadler.

**STATE LEGISLATURE.** Almost wholly Democratic.

**ARKANSAS, UNIVERSITY OF.** Situated at Fayetteville. Students in the fall of 1917 numbered 789 and there were 70 members of the faculty. Volumes in library, 25,500. Productive funds, \$132,666; total income from all sources about \$250,000. Founded in 1871. Co-educational and State institution. Departments, arts and sciences, education, engineering, agriculture (Experiment Station), extension, and medicine (at Little Rock). President, John Clinton Futrell, B.A., M.A.

**ARMENIA.** A region of western Asia, in Russia, Persia, and, principally, Turkey. The division of Turkey known as Armenia and Kurdistan consists of the vilayets of Erzerum, Mamuret-ul-Aziz, Diarbekr, Bitlis, and Van;

the area is estimated at about 72,000 square miles, and the population, prior to the great war, at about 2,470,000. According to a message received from Lord Balfour on February 23 by the American Committee for Armenia and Syrian Relief, 1,200,000 out of the 1,800,000 Armenians who had been in the Turkish Empire two years before had been either massacred or deported. Those who were massacred had often suffered the most extreme tortures and those who had been deported had been the victims of the greatest hardships, many dying from starvation, disease, and exhaustion. They were driven in troops through the swampy regions and deserts of the middle Euphrates where many died of exhaustion and many, when they were unable to march further, were massacred by their captors. See **RELIEF FOR WAR VICTIMS AND TURKEY.**

**ARMY ORGANIZATION.** See **MILITARY PROGRESS.**

**ARTILLERY.** See **MILITARY PROGRESS.**

**ARNOLD, CONWAY HILLIER.** An American naval officer, died July 16, 1917. He was born in New York City, November 14, 1848, and graduated from the Naval Academy in 1867. Commissioned as ensign in 1868 he had advanced to lieutenant commander in 1892, and in 1894 he was ordered to take charge of the Branch Hydrographic Office at New York. Later he served on the *Massachusetts*, commanded the *Bancroft* in 1897, and at the outbreak of the Spanish-American War he was made commander. He became captain in 1902 and rear admiral in command of the Third Squadron of the Atlantic Fleet in 1908. He retired November 14, 1910, being at that time president of the Naval Examining and Retiring Boards.

**ARRIAGA, MANOEL JOSÉ DE.** A Portuguese statesman, whose death was announced from Lisbon March 5, 1917. Born in 1842 in the Azores, at Horta, Arriaga received his education at the University of Coimbra, and later studied law. Although he distinguished himself in the practice of his profession, he early entered politics as Republican deputy in the Chamber of Representatives. This was during the reign of Louis I, who found the young politician an uncomfortably vigorous enemy of monarchical institutions. Arriaga identified himself actively with the movement which resulted in the overthrow of King Manuel in 1911 and the establishment of a republic. He became procurator general in the provisional government and under the new constitution was elected first president, August 24, 1911. This meant a triumph for the coalition of conservative Republicans over the Radicals, led by Dr. Alfonso Costa, provisional Minister of Justice. Costa himself was not a candidate but supported Senhor Machado. In May, 1915, after a stormy administration, Arriaga was succeeded by Theophile Braga. The degree of doctor of laws was conferred on him by his alma mater. Arriaga was a poet and also a writer on jurisprudence and on social and political economy. He was famous as an orator.

**ASIA.** The largest and most populous of the grand divisions of the globe. Its principal countries are: China, independent republic; Japan,

independent empire; Siberia, independent as a part of Russia; Siam, independent kingdom; Turkey, independent empire; India, a so-called empire under British domination; Persia, independent monarchy in part under British and Russian influence; Indo-China, a French dependency. See articles on these and other Asiatic countries.

**ASIA MINOR, OR ANATOLIA.** A division of Turkey; a peninsula forming the western extremity of Asia, between the Black Sea on the north and the eastern end of the Mediterranean Sea on the south. The estimated area is about 196,000 square miles, very nearly equal to the area of Utah and Arizona. The population may be estimated at about 9,000,000 (some estimates are somewhat higher). The area and population here given are the approximate aggregates of the vilayets of Brusa, Smyrna (Aidin), Konia, Angora, Adana, Sivas, Kastamuni, and Trebizond, and the sanjaks of Ismid and Bigha. The vilayet of the Archipelago (Ægean Islands), which belonged to Asia Minor, is occupied by Greece and Italy. The Mohammedans of Asia Minor are estimated at about 7,180,000; Armenians, 576,000; other Christians, 972,000; Jews, 184,000.

**ASPHALT.** The natural asphalt of all kinds sold in the sources of production in the United States in 1916 aggregated 98,477 short tons valued at \$923,281 compared with 75,751 valued at \$526,490, an increase of 22,726 tons or 30 per cent in quantity, in 1915. The sales of manufactured asphalt in 1916 were 664,503 short tons, valued at \$4,715,583. This was obtained from petroleum of domestic origin. An increased amount was manufactured during the year from petroleum imported from Mexico. There were in 1916, thirty-seven plants manufacturing asphalt. The States producing natural asphalt were California, Kentucky, Oklahoma, Texas, and Utah. Texas, in 1916, was the largest producer, and was followed by Utah. The asphalt imported in the United States was in 1916, 147,713 short tons, valued at \$734,712. The principal use of asphaltic materials in the United States was for highway and pavement construction and maintenance. The asphalt industry in other countries was seriously affected in 1916 by the war in Europe. The amount exported to Europe from Trinidad in 1916 was 13,380 tons, compared with 75,297 in 1914. The exports to the United States decreased from 118,001 in 1915 to 117,719 in 1916, still showing a large excess over 1914, when the corresponding figure was 67,357 tons. Trinidad is the largest producer of asphalt. Venezuela is also a large producer.

**ASPHYXIATING GASES.** See **CHEMISTRY, INDUSTRIAL; MILITARY PROGRESS.**

**ASTRONOMY.** Up to the end of 1917 the war had had little effect on the work of the American observatories, the output during the year being quite up to its usual high standard in both quantity and quality. Nor was there any reason to expect any serious curtailment of their activities, such as was experienced by most of the European observatories from which reports were forthcoming. Many new investigations of variable stars, particularly those of the Cepheid type, were reported, and Shapley announced the discovery of a variable of less than the sixteenth magnitude in the southern globular cluster Messier 9, which was probably

the faintest variable known at the time. A new star of the fourteenth magnitude was discovered by Ritchey in the spiral nebula (N. G. C. 6946) in the constellation Cepheus, and two others, one of which was no longer visible at the close of the year, were found by Curtis in the spiral nebula N. G. C. 4321. None of the periodic comets due to return to perihelion in 1917 or early in 1918 was reported up to the end of the year, and only two new comets were discovered. The work on the Mount Wilson 100-inch reflector, and the erection of the Canadian National Observatory, were both reported as nearing completion. Turkey abandoned the Mohammedan calendar for the Gregorian, thus coming into line with the western nations. The death roll of the year included the names of: General J. A. L. Bassot, director of the Nice Observatory since 1904; Professor Friedrich Robert Helmert, director of the Geodetic Institute at Potsdam and of the Central Bureau of the International Latitude Service, famous for his researches in geodesy; and Professor Edmund Weiss, emeritus director of the Vienna Observatory.

**MOUNT WILSON SOLAR OBSERVATORY.** The annual report of the director, Professor George E. Hale, covered, as usual, a large number of interesting and important results arising from the work of himself and his assistants. The chief results obtained in 1916 were summarized under fifty-one heads; a few only of the more important can be mentioned here. A study of the Zeeman effect in sun-spots near the sun's limb indicated that the lines of force spring from a level below that of the region of the penumbra. Many dark hydrogen flocculi and filaments were identified with prominences. Systematic differences were found between the measurements of close pairs of solar lines given by Rowland and those obtained at Mount Wilson, the latter being the smaller; the differences were largest when the lines were very close to each other. The errors found appeared to be physiological, the observer tending to make the separation larger when the intensity of the continuous spectrum between the lines was reduced below that of the general background. The mutual repulsion of close pairs of lines called for by the anomalous dispersion theory fails therefore to receive the support which a comparison between the Rowland and the International wave-lengths had seemed to lend to the theory. Bipolar sun spots in both hemispheres, irrespective of latitude, were found to be opposite in polarity to the bipolar spots of the corresponding hemisphere observed before the recent sun spot minimum, although the hydrogen vortices still retained the direction of rotation which they had before the minimum. Comparative studies of solar and vacuum-tube spectra negated the conclusion regarding the presence of electric fields in sun spots which was announced in the director's report for 1915. Professor Kapteyn continued his investigations on the relation between the proper motions and radial velocities of the stars, and announced his discovery of an acceleration of the First Star-stream, but the announcement was made with some reservation, since a more extensive investigation unearthed a number of contradictions. The stars of spectral type B, which had hitherto been regarded as forming a single stream distinct from the two main star-streams, were

found to belong almost entirely to the First Stream. A rapid and reliable method of determining the color of a star was developed, in which the ratio of the times of exposure necessary for the blue and yellow light to produce images of the same size was used as a measure of the color, all exposures being made on the same plate; with due care the error in the result can be reduced to about .06 magnitude in the color-index. Observations on the magnitudes in star-clusters and work on the Cepheid variables were continued by Mr. Shapley, whose earlier conclusions regarding the absence of light-scattering in interstellar space and the existence of giant red stars in globular clusters were confirmed. The spectroscopic method of determining stellar parallaxes, developed by Dr. W. S. Adams, was tested by applying it to 124 stars of measured parallax, and gave satisfactory results, the average deviation from the measured value of the parallax being  $0''.025$ . The method was found to be most accurate when applied to stars of spectral types K and M, and least accurate for the F stars. Evidence of the presence of lithium in the sun was found.

**THE SUN.** As already stated in the summary of the work accomplished at the Mount Wilson Solar Observatory, it was found that the magnetic polarity of sun spots was reversed at the recent minimum of solar activity. The first observations were made while the spots of the new cycle were appearing in high latitudes, and it was thought at first that the polarity depended upon the latitude. Later observations on spots appearing nearer the equator showed that this was not the case, and that the reversal of polarity still occurred. Another reversal of polarity was looked for as a possibility of the approaching spot maximum. The question was complicated by the fact that the direction of whirl in the overlying hydrogen vortices was not reversed at the same time, and the evidence seemed to point to a hydrodynamical hypothesis as the true explanation of sunspot phenomena. Further observations at Mount Wilson on the general magnetic field of the sun gave for the inclination of the magnetic axis of the sun to its axis of rotation the value  $5^\circ.2$ , and for the period of its revolution about that axis about 31.5 days.

Investigation of photographs taken with the spectro-heliograph at the Yerkes Observatory between May, 1904, and January, 1917, led Dr. O. J. Lee to conclude that the commonly accepted association of prominences with sun spots and flocculi is not warranted. Out of 4068 prominences of all sizes, which occurred between  $+45^\circ$  and  $-45^\circ$  of solar latitude, only 5.8 per cent were associated with sun spots, and only 8 per cent with flocculi in which no spot was observed; many of the larger prominences were found in unmarked regions of the solar surface. These conclusions were confirmed by Mr. and Mrs. Evershed, who examined nearly 71,000 prominences photographed between 1890 and 1914. They found that there were four belts, two in each hemisphere, which were especially prolific in prominences. The belts near the equator coincided with the sun spot zones, and though the number of prominences was found to be roughly proportional to the number of spots, there was only occasionally direct association of the two phenomena.

**SOLAR ACTIVITY.** Intense spot activity marked

the months of February and August, when two of the four largest groups of spots seen during the past forty-five years made their appearance. The February group, which consisted of two enormous spots connected by a large number of small ones, appeared in the southern hemisphere, and was easily visible to the naked eye, being over 125,000 miles long and 64,000 miles broad; it was under observation during the greater part of the month. It was eclipsed in size, however, by the group which appeared on the east limb of the sun to the north of the equator on August 3. This group attained its maximum area on August 8 or 9. When it crossed the central meridian on August 10, its area had become somewhat reduced, but still amounted to more than 3,600,000,000 square miles, or 3000 millionths of the sun's visible hemisphere. At this time, sixteen other well-defined groups were present on the sun's disc, adding over 3,000,000,000 square miles to the spotted area.

**JUPITER'S NINTH SATELLITE.** Messrs. Nicholson and Shapley determined the photographic magnitude of the ninth satellite at mean opposition. The magnitude was found to be 18.6, those of the seventh and eighth satellites being 17.5 and 18.0 respectively. In estimating the angular diameter, the color-index was taken as one magnitude, and values of .009 and .006 seconds were obtained, according to the value adopted for the visual albedo. These values correspond to linear diameters of 17.4 and 11.2 miles respectively, between which limits the true diameter probably lies. Professor Nicholson also published a description of the orbit of the satellite. The eighth and ninth satellites were found to move in almost equal interlocked orbits, whose planes are inclined at an angle of about  $10^\circ$ . The motion of the ninth satellite is retrograde, and its period is about 745 days, that of the eighth satellite being 739 days. The two are thus associated in much the same way as the sixth and seventh satellites.

**URANUS.** Mr. Leon Campbell made the interesting discovery that the light of Uranus varies to the extent of .15 magnitude in a period of .451 day. This agrees with the period of rotation of the planet as determined spectroscopically by Lowell and Slipher. The variation is attributed to unequal brightness of different portions of the surface of the planet, and, if it should prove to be permanent, should afford an accurate method of determining the period of rotation.

**PLANETARY DISTANCES.** The empirical law of planetary distances usually attributed to Bode breaks down when applied to the planet Neptune, although it gives very approximately the distances of the other planets. The error in the case of Neptune amounts to nearly 30 per cent, and, in consequence, efforts have been made from time to time to reconstruct the law so as to bring Neptune into line. Among the substitutes suggested may be mentioned the laws developed by Gaussin (1880) and Bélot (1905), which reduce the error in the case of Neptune to 7 per cent and 10 per cent respectively, but at the same time fail to give the other planetary distances with the same degree of accuracy as Bode's Law. When expressed mathematically in terms of a variable  $\gamma$  corresponding to the order of the planet in the sequence starting from the sun, all three laws imply the existence of planets where none is known. Thus,

Bode's series needs an infinite number between Mercury and Venus for its completion, Gaussin's has room for seven intramercurial planets, while Bêlot's series has four gaps between the sun and Mercury and one between Mercury and Venus. Armellini published a new law in which the distance  $\sigma$  was expressed by means of the extremely simple formula,  $\sigma = 1.53\eta$ , where 1.53 represents the distance of Mars from the sun, and  $\eta$  assumes the values — 2, — 1, 0, 1, etc., for Mercury, Venus, Earth, Mars, etc. Two values of  $\eta$ , viz., 2 and 3, give the distances 2.34 and 3.58, which correspond to the limits of the zone of minor planets, while the value  $\eta = 6$  calls for the existence of a planet between Saturn and Uranus. This is considered to be by no means an impossibility, though undoubtedly the planet would be extremely small.

The general agreement of the distances according to Armellini with the true distances is shown in the following table, in which those deduced by Bode are also given for comparison.

	$\eta$	Armelini	Bode	True distance
Mercury .....	— 2	0.427	0.4	0.387
Venus .....	— 1	0.654	0.7	0.723
Earth .....	0	1.00	1.0	1.00
Mars .....	1	1.53	1.6	1.52
	2	2.34	...	...
Minor planets...	3	3.58	2.8	...
Jupiter .....	4	5.48	5.2	5.20
Saturn .....	5	8.38	10.0	9.54
	6	12.32	...	...
Uranus .....	7	19.46	19.6	19.2
Neptune .....	8	29.76	38.8	30.1

**BARNARD'S RUNAWAY STAR.** The parallax of this large proper-motion star in Ophiuchus, which was discovered by Professor Barnard in 1916, was determined by several observers. Professor Schlesinger, of the Allegheny Observatory, found a parallax of .52 second, and a proper motion in right ascension of — .73 second. Other values obtained for the parallax were .47 second by Professor Mitchell, of the Yerkes Observatory, and .55 second by Dr. O. J. Lee, of the Leander McCormick Observatory. All three determinations were made by the spectroscopic method. The value must therefore be very nearly half a second, so that the star is the nearest star in the northern hemisphere. Early in 1916 Mr. Innes, of the Johannesburg Observatory, discovered a faint star of large proper motion in the vicinity of  $\alpha$  Centauri. He later made a provisional determination of its parallax, which he found to be about .8 second, indicating that the star was about as far away from us as  $\alpha$  Centauri. If his estimate should prove to be correct, Barnard's star is the third nearest known star in the heavens.

**DAYLIGHT PHOTOGRAPHY OF STARS.** Some interesting experiments in the daylight photography of stars were undertaken by A. F. and F. A. Lindemann with the object of ascertaining whether it was possible to detect the slight deviation of a ray of light passing near the sun which follows from Einstein's theory of relativity. Panchromatic plates were used, and the exposures were made through red filters which transmitted practically no light of shorter wavelength than 6700 Å. Using a six-inch refractor, they succeeded, in spite of unfavorable climatic conditions, in photographing stars down to the third magnitude at distances as close as 20°

to the sun's centre. The deviation at this distance, however, was too small to be detected.

**DETERMINATION OF STAR COLORS.** The photographic method of determining the colors of stars, developed by Seares at Mount Wilson, promised to be of special value because of its independence of the magnitude of the star. The method consisted in taking a series of exposures on the same plate, using a yellow filter for the yellow image and without filter for the blue image, and in comparing the times necessary to give images of the same size. The ratio of the times of exposure was found to give the color-index with a probable error of not more than .06 magnitude. The color-indices were derived from comparison with similar ratios for standard polar stars. An interesting result of the investigation was the confirmation of the absence of faint white stars from the circumpolar region of the heavens.

**MINIMUM RADIATION VISUALLY PERCEPTIBLE.** Professor H. N. Russell reexamined the evidence for the least quantity of radiant energy capable of producing the sensation of light. This was recently shown by Ives to be much smaller than had previously been supposed. The factors which entered into the discussion of the question were four in number, viz., the mechanical equivalent of light, the stellar magnitude of the standard candle, the diameter of the pupil of the eye when accommodated to complete darkness, and the stellar magnitude of the faintest visible objects. The first two of these factors were well determined, and were taken unchanged from Ives's discussion. The values adopted were respectively 1.59 ergs per second per square centimetre for light of intensity one metre-candle and wave-length 0.55  $\mu$ , and —14.18 mag. The last two factors were more uncertain. Steavenson had obtained flashlight photographs of eyes accommodated to complete darkness, and found the mean diameter of the pupil to be 8.5 mm., giving as the area of the pupil .57 sq. mm., or just double the value used by Ives. From observations by himself and Curtis, Russell deduced the value 8.5 for the magnitude of the faintest visible stars instead of the commonly accepted value 6. The introduction of these modified factors led to the conclusion that the minimum perceptible radiation corresponded to the reception by the eye of one erg in 40 years, or one gram-calorie in 1700 million years.

**THE TEMPERATURE OF SPACE.** In an interesting communication to the *Astrophysical Journal*, Professor Fabry drew attention to the fact that at a point in free space the notion of temperature has no meaning in itself. To make the notion precise, there must be introduced into the region to be studied a small test body which will ultimately assume a certain temperature of equilibrium. The question, however, is complicated by the fact that the temperature of the test body may vary between almost infinite limits, according to the absorptive properties of its surface. Ordinarily the surface is supposed to be perfectly black, and therefore able to absorb the maximum amount of radiant energy. It might therefore be considered that such a body would give the maximum temperature at the point of space under investigation. But such a view would be totally incorrect. A body endowed with absorption, partial but selective, may assume a temperature quite different from that of the black body. It may be enormously

higher, or lower, according to the wave-length of the absorption band. A black body isolated in space and exposed to the solar radiation at the distance of the sun from the earth would assume a temperature of  $280^{\circ}$  abs. But a body capable of absorbing long wave-lengths and only slightly absorbent for short wave-lengths, would radiate like a black body and absorb very little, so that its temperature of equilibrium would be very low, while one capable of absorbing short wave-lengths and non-absorbent for the long wave-lengths would reach a temperature much higher than that of the black body, for only at that temperature would it reach a state of equilibrium. If the sun were abolished, there would remain only the general radiation of the stars. Under such conditions, the black body would attain a temperature of  $3^{\circ}$  abs., while the test body with an absorbent band in the green would reach  $1000^{\circ}$  abs. M. Fabry considers it possible that herein lies the explanation of the luminosity of the tails of comets. This has been attributed to cathode rays from the sun, but the luminosity of the aurora borealis, which has been attributed to the same agency, demands a very intermittent cathodic emission which seems irreconcilable with the phenomena observed in comets.

**THE BEGINNING OF THE ASTRONOMICAL DAY.** Sir F. W. Dyson, the Astronomer Royal of England, and Professor H. H. Turner, of Oxford University, asked for expressions of opinion by astronomers as to the desirability of adopting the civil day, i. e., the day beginning at midnight, in astronomical ephemerides. The change was recommended as long ago as 1884 at the Washington Congress, but nothing was done, as it seemed at that time to have the observations of a single night all of the same date. Apart from the discontinuity which would be introduced into astronomical records by the change, there would appear to be no other serious difficulty involved. A general agreement among astronomers once reached, a date could be set for the inauguration of the change, which would interfere as little as possible with the preparation of the various national ephemerides.

**DAYLIGHT SAVING AND STANDARD TIME IN NEW ZEALAND.** It was proposed to change the standard time of New Zealand from 11h. 30m. fast on Greenwich to 12h. The present standard time was adopted as long ago as 1868, so that New Zealand may be looked upon as the pioneer in a movement which at a much later date received international sanction. By putting the clock forward thirty minutes a permanent saving of daylight of that amount will result, and at the same time the time of the Dominion will be brought into conformity with the International Time Agreement.

**NEEDS OF ASTRONOMY.** The subcommittee on Astronomy of the Committee of One Hundred on Scientific Research appointed by the American Association for the Advancement of Science issued a valuable report on the most pressing needs of astronomy. Among the principal suggestions for the best use of a large fund for research were the following: the reestablishment of the friendly international relations of astronomers of three years ago by assisting large astronomical projects either directly or indirectly; the provision of assistants for astronomers, to relieve them of laborious routine work;

aid to observatories south of the equator, for the purpose of bringing our knowledge of the southern stars to an equality with that of the stars of the northern hemisphere; the establishment of a computing bureau for the preparation of tables needed for any special or general purpose; and the relief of astronomers, overburdened by teaching, so as to enable them to undertake more research work. The necessity for increasing the facilities for observation in the southern hemisphere was also emphasized in a somewhat similar report issued by the Committee on Astronomy of the National Research Council.

**COMETS.** D'Arrest's Comet was the only periodic comet due to pass through perihelion in 1917. It has a period of 6.67 years, and has been observed at almost every return since its discovery in 1851, its last appearance being in 1910. It was due at perihelion early in April, but, being unfavorably placed for observation, failed of detection. Several other periodic comets whose passage through perihelion was expected to occur during the early part of 1918, also escaped detection. Among these were Tempel I, Brooks II, and Faye's Comet. The reappearance of De Vico's long-period comet of 1846 was expected some time after 1917. As the possible error of its period is three years, there was a bare possibility that it might return in 1917, but the year passed without the announcement of its discovery. Of the comets discovered in 1916, Wolf's Comet (1916 b) was under observation during the greater part of the year. At the beginning of the year it was much fainter than was expected, but it brightened to the tenth magnitude in mid-April, after which it faded to magnitude 11.5 by the beginning of May. During the summer it brightened again until in August it became an object of the eighth magnitude, but it never fulfilled the extravagant predictions of brilliancy which were made for it.

**NEW COMETS.** Two new comets were discovered in 1917. They were:

Comet 1917 a, discovered by Mellish on March 19. Its perihelion passage took place on April 10, at which time it was very bright, being quite close to the sun. About April 16 it was a conspicuous naked-eye object of the first magnitude, with a tail  $10^{\circ}$  long. It decreased rapidly in brightness, and at the beginning of May was only of the fifth magnitude. It soon passed to the southern hemisphere where it was under observation for some time. Its period was variously estimated at 142 years and 180 years.

Comet 1917 b, found by Schaumasse at Nice on April 25. It was of the ninth magnitude, and was described as being a circular nebulosity, of yellowish tint, and possessing a central condensation. It passed through perihelion on May 18. Shortly after its perihelion passage, it was observed to be large and bright, with strong central condensation, its magnitude having increased to 5.5.

The discovery of a third comet was reported from Heidelberg by Professor Wolf on September 14. It was at first mistaken for Encke's Comet, but later it was announced that it was probably a minor planet.

**MINOR PLANETS.** It was reported from the Harvard College Observatory that the minor planet (129) Antigone had been found to be

variable. The range of variability was about .4 magnitude, with a period of two or three hours. A minor planet of about the fourteenth magnitude, discovered by Rev. Joel H. Metcalf, was announced as being probably the smallest known celestial object. On the assumption that its albedo is equal to that of Mars, it was estimated to be not more than three miles in diameter.

**OTHER EVENTS.** The Janssen prize of the Astronomical Society of France was awarded to Professor George E. Hale, the distinguished director of the Mount Wilson Solar Observatory, for his important researches in solar physics. Professor Hale was also honored by having conferred upon him the degree of Doctor of Science by Columbia University, and that of Doctor of Laws by Princeton University. The gold medal of the Royal Astronomical Society was awarded to Dr. W. S. Adams, of the Mount Wilson Solar Observatory, for his investigations in stellar spectroscopy, and especially for his determination of absolute magnitudes. The Bruce gold medal of the Astronomical Society of the Pacific was awarded to Professor E. E. Barnard, of the Yerkes Observatory, for his distinguished services to astronomy.

**LITERATURE.** Among the books on astronomy published in 1917 may be mentioned: A. H. Holt, *Manual of Field Astronomy*; E. B. Knobel, *Ulugh Beg's Catalogue of Stars*; J. E. McGegan, *Star Identifier and Diagrams for the Graphical Solution of Problems in Nautical Astronomy*; Rev. T. W. Webb, *Celestial Objects for Common Telescopes* (6th rev. ed.).

**ASTROPHYSICS.** See ASTRONOMY.

**ATHLETICS.** See under the various titles such as BASEBALL, FOOTBALL, GOLF, HOCKEY, etc.

**ATHLETICS, TRACK AND FIELD.** No branch of sport responded more readily to the call to the colors than did track and field athletics. The result was that 1917 was a barren year in the way of record-breaking performances. The majority of the stars hung up their athletic togs and garbed themselves in the khaki of the army or the blue of the navy. Three names, however, stand out in the various competitions of the year. They are Clinton Larsen of Brigham Young University, Provo, Utah; John W. Overton of Yale University; and Andrew B. Kelly of Holy Cross College.

Larsen distinguished himself at the annual athletic carnival held by the University of Pennsylvania at Philadelphia on April 27 and 28 when he cleared 6 feet, 5½ inches in the high jump and then leaped over the bar at 6 feet, 7½ inches in an endeavor to establish a new world record. Although Larsen in this second effort cleared the cross stick easily he had the misfortune to graze the bar with his shoulder, causing it to fall to the ground.

Later in the season Larsen made another attempt to shatter the world mark in a special meet at his own university. This time he jumped the required height, 6 feet, 7½ inches, but the Amateur Athletic Union was unable to accept the record as the meet in which it was made was not held under A. A. U. sanction. The showing of Larsen for the entire season has never been equaled. He took part in seven different meets, establishing an average jump of slightly less than 6 feet, 4 inches.

Overton was the most brilliant performer of the year on the running track. In a one-mile

race at Exposition Hall, Philadelphia, in March, the Yale athlete established an American and world record of 4 minutes, 16 seconds; and a week later in the senior national indoor championship games, at the Twenty-second Regiment Armory, New York City, he ran 1000 yards in 2 minutes, 14 seconds, faster time than was ever made before in this event.

Kelly achieved athletic fame at the national indoor championships by running 300 yards, two turns, in 31½ seconds. Kelly made the same time twice, first in the trial heat and then in the final.

Soon after the entry of the United States into the war, the Amateur Athletic Union cancelled its championship meets, but later rescinded this action and the national A. A. U. senior outdoor championships were held under the auspices of the Western Association of the A. A. U. and a Citizens' Committee at Washington University Stadium, St. Louis, Mo. The games naturally were not up to the usual high standard due to the absence of many of the leading athletes and clubs because of the war.

The team honors in the national games were won by the Chicago Athletic Association which scored a total of 60 points. The Illinois A. C. finished second with 23 points and the Boston Athletic Association third with 15 points. Unattached athletes accounted for 21 points.

Other clubs to score were: Millrose A. A., New York, 14; Kansas City A. C., 10; Irish-American A. C., New York, 10; Meadowbrook Club, Philadelphia, 8; Pittsburgh A. A., 7; Boys' Club, New York, 5; Toronto (Canada) Y. M. C. A., 5; Brigham Young University, Provo, Utah, 5; Alpha Physical Culture Club, New York, 4; Long Island A. C., Brooklyn, N. Y., 3; Chicago Turngemeinde, 3; Salem-Crescent A. C., New York, 3; Missouri A. A., 3; St. Stanislaus Club, Bay St. Louis, Miss., 3; Multnomah A. C., Portland, Ore., 2; Dorchester Club, Dorchester, Mass., 2; University of Missouri, 1.

In the national A. A. U. junior outdoor championships which were also held at St. Louis the Illinois A. C. won the team title with 47 points. The Meadowbrook Club was second with 30 and the Columbian A. C., St. Louis, third, with 22. Other point winners were: Missouri A. A., 13; Salem-Crescent A. C., 10; Alpha Physical Culture Club, 8; University of Missouri, 7; Boston A. A., 7; Pittsburgh A. A., 5; Germantown Boys' Club, Philadelphia, 5; Chicago Turngemeinde, 5; St. Stanislaus A. C., 5; Danish-American A. C., Chicago, 3; Washington University, 3; Kansas City A. C., 2; Paulist A. C., New York, 2; Loughlin Lyceum, Brooklyn, N. Y., 2; Perryville High School, 2; Logan Square A. C., Chicago, 2; Missouri School of Mines, 1; Millrose A. A., 1.

The individual winners in the senior outdoor meet were:

100-yard dash, A. E. Ward, Chicago A. A., 10½ seconds; 3-mile walk, G. H. Goulding, Toronto (Canada) Y. M. C. A., 21 minutes, 50½ seconds; 440-yard hurdles, F. Smart, Chicago A. A., 54½ seconds (equals record); 120-yard high hurdles, H. E. Barron, Meadowbrook Club, Philadelphia, 15 seconds; 1-mile run, J. W. Ray, Illinois A. C., 4 minutes, 18½ seconds (new record); 440-yard run, F. Shea, Pittsburgh A. A., 49½ seconds; 220-yard low hurdles, F. F. Loomis, Jr., Chicago A. A., 24½ seconds;

220-yard run, A. E. Ward, Chicago A. A., 22½ seconds; 5-mile run, C. Pores, Millrose A. A., 26 minutes, 26½ seconds; 880-yard run, M. J. Devaney, Millrose A. A., 1 minute, 57 seconds; throwing 16-pound hammer, P. J. Ryan, Irish-American A. C., 168 feet, 7½ inches; pole vault, E. Knourek, Illinois A. C., 12 feet, 9 inches; throwing the discus, A. W. Mucks, Chicago A. A., 140 feet, 1½ inches; putting 16-pound shot, A. W. Mucks, Chicago A. A., 45 feet 10½ inches; running high jump, C. Larsen, Brigham Young University, 6 feet, 2½ inches; running broad jump, J. Irish, Chicago A. A., 22 feet, 4½ inches; throwing 56-pound weight, P. J. Ryan, Irish-American A. C., 33 feet, 3 inches; throwing the javelin, G. A. Bronder, Jr., unattached, 184 feet, ½ inch; running hop, step, and jump, D. Ahearn, Illinois A. C., 47 feet, 8 inches.

The national A. A. U. senior indoor championships were contested at the Twenty-second Regiment Armory, New York, on March 17. The team winner was the Chicago A. A., which scored a total of 37 points. The New York A. C. was second with 30 points, and the Irish-American A. C. third with 22. Other point winners were: Millrose A. A., 8; Boston A. A., 8; Yale University, 5; Dartmouth College, 5; Illinois A. C., 5; Meadowbrook Club, 5; Princeton University, 4; Maryland State College, 3; University of Pennsylvania, 2; Long Island A. C., 2; Syracuse University, 1; Victrix C. C., Philadelphia, 1.

The individual winners were: 5-mile run, H. Holden, New York A. C., 25 minutes, 35½ seconds; 1000-yard run, J. W. Overton, Yale University, 2 minutes, 14 seconds (new championship and American indoor record); 60-yard run, J. G. Loomis, Chicago A. A., 6½ seconds (equals American record); 2-mile run, J. Ryan, Boston A. A., 10 minutes, 4½ seconds; 70-yard high hurdles, E. J. Thompson, Dartmouth College, 9½ seconds (equals championship record); standing high jump, W. H. Taylor, Irish-American A. C., 5 feet, 2½ inches; 600-yard run, E. Eby, Chicago A. A., 1 minute, 14½ seconds; 2-mile walk, R. Remer, New York A. C., 13 minutes, 59½ seconds; 300-yard run, A. B. Kelly, Holy Cross College, 31½ seconds (new world indoor record); running high jump, J. G. Loomis, Chicago A. A., 6 feet, 2 inches; standing broad jump, J. C. Hoskins, Chicago A. A., 10 feet, 7¼ inches; putting 16-pound shot, P. J. McDonald, Irish-American A. C., 47 feet, 7¼ inches (new championship record); medley relay, 1¼ miles, four men, legs of 220 yards, 440 yards, 880 yards, and one mile, Chicago A. A., J. G. Loomis, E. Eby, S. Landers, and V. H. Campbell.

For the first time in forty-one years the Intercollegiate Association of Amateur Athletes of America failed to hold its outdoor championship games. The Association, however, conducted its third annual indoor meet, inasmuch as the date selected came before the entry of the United States into the war. The games were held at Philadelphia on March 3, the winners in the various events being:

1½-mile relay race, Cornell, with Shelton, Acheson, Windnagle, and Crim; 2½-mile relay race, Yale, with Rolfe, Ireland, Cooper, and Overton; 4½-mile relay race, Cornell, with Wenz, McDermott, Boynton, and Dresser; running high jump (team prize), Pennsylvania;

(individual winner) A. W. Richards, Cornell, and C. Thibault, Pennsylvania, tied at 6 feet 1 inch; 50-yard hurdles (team prize), Yale; (individual winner) Farwell, Yale; 50-yard run, (team prize) Harvard; (individual winner) O'Hara, Massachusetts Institute of Technology, 5½ seconds; running broad jump (team prize), Cornell; (individual winner) A. W. Richards, Cornell, 21 feet, ½ inch; mile graduate race, Pennsylvania, with Lockwood, Ferguson, Steele, and Meredith, 3 minutes, 34½ seconds; pole vault (team prize), Cornell and Pennsylvania tied; (individual winners) Newstetter and Sewell, Pennsylvania, and Foss, Cornell, tied at 12 feet, ¼ inch; putting the shot (team prize), Cornell; (individual winner) Sinclair, Princeton, 44 feet, 9½ inches.

The New England intercollegiate championships were won by the Massachusetts Institute of Technology with 61 points. Brown University was second with 50 points and Worcester Polytechnic Institute third with 13. Lafayette captured the Middle States Conference title by scoring 38½ points. New York University was second with 29 points and Swarthmore third with 25½.

Frederick W. Rubien, secretary-treasurer of the Amateur Athletic Union, made the following selections for All-America Athletic teams for the year 1917:

All-America Athletic Team—60-yard run, J. G. Loomis, Chicago A. A.; 100-yard dash, A. E. Ward, Chicago A. A.; 220-yard dash, M. M. Kirksey, Olympic Club, San Francisco; 300-yard run, A. B. Kelly, Holy Cross College; 440-yard run, F. J. Shea, Pittsburgh A. A.; 600-yard run, Earl Eby, Chicago A. A.; 880-yard run, M. J. Devaney, Millrose A. A., New York; 1000-yard run, J. W. Overton, Yale University; 1-mile run, E. H. Fall, Oberlin College; 2-mile run, Joie Ray, Illinois A. C.; 5-mile run, Charles Pores, Millrose A. A.; 10-mile run, W. Kyronen, Millrose A. A.; cross-country, James Hennigan, Dorchester (Mass.) Club; Marathon, W. J. Kennedy, Morningside A. C., New York; 70-yard hurdles, E. J. Thompson, Dartmouth College; 120-yard hurdles, Robert Simpson, University of Missouri; 220-yard hurdles, F. F. Loomis, Chicago A. A.; 440-yard hurdles, Floyd Smart, Chicago A. A.; walking, William Plant, Long Island A. C., New York; standing broad jump, J. Irish, Chicago A. A.; standing high jump, W. H. Taylor, Irish-American A. C., New York; running high jump, Clinton Larsen, Brigham Young University, Provo, Utah; running hop, step, and jump, D. F. Ahearn, Illinois A. C.; pole vault, Ed. Knourek, Illinois A. C.; putting 16-pound shot, P. J. McDonald, Irish-American A. C.; throwing 56-pound weight, M. J. McGrath, New York A. C.; throwing the discus, A. W. Mucks, Chicago A. A.; throwing 16-pound hammer, P. J. Ryan, Irish-American A. C.; throwing the javelin, G. A. Bronder, Jr., Brooklyn, N. Y.; all-around champion, H. Goelitz, Chicago A. A.

All-America College Team—100-yard dash, J. V. Scholz, University of Missouri; 220-yard dash, C. Hoyt, Grinnell College; 440-yard run, F. J. Shea, University of Pittsburgh; 880-yard run, Earl Eby, University of Pennsylvania; 1-mile run, E. H. Fall, Oberlin College; 2-mile run, J. W. Overton, Yale University; cross-country, I. Dresser, Cornell University; 120-yard hurdles, Robert Simpson, University of Mis-

souri; 220-yard hurdles, E. Strehle, Pomona College, California; 440-yard hurdles, Floyd Smart, Northwestern University; running high jump, Clinton Larsen, Brigham Young University; running broad jump, S. Butler, Dubuque College, Iowa; running hop, step, and jump, W. Overbee, University of Illinois; pole vault, W. I. Newstetter, University of Pennsylvania; putting 16-pound shot, A. W. Mucks, University of Wisconsin; throwing 16-pound hammer, B. Bennett, University of Illinois; throwing the discus, M. R. Husted, University of Illinois; throwing the javelin, free style, C. Higgins, University of Chicago; throwing the javelin, regulation style, R. Nourse, Princeton University; throwing 56-pound weight, H. White, Syracuse University; pentathlon, Howard Berry, University of Pennsylvania.

All-America Interscholastic Team—100-yard dash, A. Lever, Mercersburg (Pa.) Academy; 220-yard dash, W. B. Hayes, St. Benedict's Prep., Boston; 440-yard run, C. E. Bushnell, Hill School, Pottstown, Pa.; 880-yard run, J. J. Tully, St. Benedict's Prep.; 1-mile run, A. Woodruff, Central High School, Newark, N. J.; 2-mile run, Joseph Nulty, St. Benedict's Prep.; cross-country, Allen Swede, Mercersburg; 120-yard hurdles, W. E. Massey, Jr., Hill School; 220-yard hurdles, D. Rogers, Lake Forest (Ill.) Academy; running high jump, C. Sweet, Lawrenceville Academy; running broad jump, W. Dowding, Bowen High School, Chicago; pole vault, T. P. Gardner, Hill School; putting 12-pound shot, A. Wilson, Radnor High School, Philadelphia; throwing 12-pound hammer, J. Angell, Mercersburg Academy; throwing the discus, R. Wilkinson, Shattuck School, Faribault, Minn.; throwing the javelin, F. Wilcoxon, Oak Park High School, Chicago.

Track and field sports in Europe during 1917 were confined almost entirely to the neutral Scandinavian countries. Sweden held a championship meet at Stockholm in August in which twelve new records were established as follows: 1500-metre run, J. Zander, Stockholm, 3 minutes, 54.7 seconds; 1600-metre run (1 English mile), J. Zander, 4 minutes, 17.5 seconds; 2000-metre run, J. Zander, 5 minutes, 31 seconds; 3000-metre run, J. Zander, 8 minutes, 35.7 seconds; 4828-metre run (3 English miles), J. Zander, 14 minutes, 38.7 seconds; 5000-metre run, J. Zander, 14 minutes, 58.6 seconds; 400-metre low hurdles, T. Norling, Malmo, 57.4 seconds; running high jump, K. Kullerstrand, Eskilstuna, 1 metre, 89 centimetres; throwing the javelin, best hand, E. Lemming, Stockholm, 62 metres, 32 centimetres; throwing the javelin, both hands, Y. Hackner, Karlskoga, 114 metres, 28 centimetres; throwing the discus, both hands, O. Zallhagen, Stockholm, 83 metres, 46 centimetres; pole vault, C. Harleman, Falun, 3 metres, 90 centimetres.

Following the Swedish games an international meet with Sweden, Norway, and Denmark being represented was held at Christiania, Norway. The athletes from Sweden scored the largest number of points, 31, Norway finishing second with 22, and Denmark bringing up the rear with 13. In the eleven events contested Sweden captured eight first places as against Norway's three. Norway and Denmark both held national championships but no new records were made.

**ATLANTA CONFLAGRATION.** See FIRE PROTECTION.

**ATOMIC WEIGHTS.** See CHEMISTRY, GENERAL PROGRESS OF.

**ATWOOD, ISAAC MORGAN.** An American clergyman, educator, and author, died October 26, 1917, at Washington, D. C. He was born in Pembroke, N. Y., in 1837, was educated at Yale and ordained to the ministry of the Universalist Church in 1861. After holding several New York and New England pastorates he was appointed president of the Canton Theological Seminary in 1879. He was Superintendent of the Universalist Church in the United States and Canada in 1898-1906. Dr. Atwood was an Associate Editor of the *Encyclopædia Britannica* and in 1911 became professor of theology and philosophy at St. Lawrence University. He wrote several religious books.

**AUSTEN, DAVID ELWELL.** An American soldier, died July 16, 1917, at Mountain Lake N. J. He was born at Clifton, Staten Island, February 6, 1841, and was educated at the Swinburne Collegiate Institute at White Plains. He was for some years in the employ of oil companies but studied law, graduated from the New York University Law School, and was admitted to the bar. At the outbreak of the Civil War he enlisted in the Seventh Regiment, later won his commission in the Forty-seventh Regiment, became a Colonel at the age of twenty-seven and Commanding Officer of the Thirtieth Coast Defense Command in 1877 and again in 1888. In 1908 he was appointed head of the Coast Artillery with the rank of Brigadier General, and in 1911 he was retired from the New York National Guard with the rank of Major General. He was Receiver of Taxes for New York City for over twenty years and in 1912 was appointed Superintendent of Parks for Queens, holding that office only for a short time.

**AUSTRALIA, COMMONWEALTH OF.** A self-governing dominion of the United Kingdom, between the Pacific and Indian oceans. It consists of the island (or continent) of Australia, the Island of Tasmania, and adjacent small islands, and is divided into six States and two territories. The temporary seat of the Federal government is Melbourne, in the State of Victoria. The permanent capital will be Canberra, founded 1913, in the Federal Territory. The Federal Territory is within the State of New South Wales.

**AREA AND POPULATION.** The estimated area of the Commonwealth is 2,974,581 square miles. This area falls short of the gross area of Continental United States by only 52,208 square miles, or about the area of the State of North Carolina. Much of Australia is uninhabited, and a large part of the interior, especially in the west, is sandy and stony desert. The table below shows by States and territories the estimated area, together with the population according to the census of April 3, 1911, and the estimate of June 30, 1916:

	Square miles	Population 1911	1916
New South Wales..	309,460	1,648,734	1,856,494
Victoria .....	87,884	1,815,551	1,405,977
Queensland .....	670,500	605,813	687,471
South Australia....	380,070	408,558	433,563
Western Australia..	975,920	282,114	314,687
Tasmania .....	26,215	191,211	197,497
Northern Territory.	523,620	3,310	4,846
Federal Territory..	912	1,714	2,472
Commonwealth	2,974,581	4,455,005	4,903,007

Western Australia comprises about 32.8 per cent of the total Commonwealth area; Queensland, 22.5; Northern Territory, 17.6; South Australia, 12.8; New South Wales, 10.4; Victoria, 3.0; Tasmania, 0.9. The population figures in the table above are exclusive of full-blooded aborigines. Such persons more or less civilized and in the employment or within the settlements of whites numbered 19,939 at the 1911 census. The total number of aborigines is not known; authorities believe that it was never large and that at present it does not exceed 100,000. The 1911 census returned 52,343 persons of non-European race, including: half-caste aborigines, 10,113; full-blood and half-caste Asiatics, 34,838 and 3852 respectively; Polynesians, 2524 and 227. Of the 1911 population, 3,667,670 were born in Australia, 590,722 in the United Kingdom, 73,949 in other European countries, 36,442 in Asia, 31,868 in New Zealand, 11,278 in America, and 3410 in Polynesia. The total population of the Commonwealth increased to 4,940,952, as estimated for the end of 1914; but a decline began with the departure of the expeditionary forces for the great war.

Estimated populations of the capital cities with suburbs were as follows at the end of 1915: Sydney, New South Wales, 763,000 (40.83 per cent of the total population of the State); Melbourne, Victoria, 684,000 (48.24 per cent); Brisbane, Queensland, 161,938 (23.80 per cent); Adelaide, South Australia, 209,450 (47.64 per cent); Perth, Western Australia, 106,792 (33.58 per cent); Hobart, Tasmania, 39,838 (19.82 per cent).

The birth rate for the Commonwealth per 1000 mean population in 1915 was 27.25 (27.18 in 1901); death rate, 10.66 (12.22); marriage rate, 9.14 (7.32). In 1914 and 1915 respectively, births numbered 137,983 and 134,871; deaths, 51,720 and 52,782; marriages, 43,311 and 45,224.

**RELIGION AND EDUCATION.** The following returns were made by the 1911 census: Christian persons, 4,274,414; non-Christian, 36,785; indefinite, 14,673; persons of no religion, 10,016; persons objecting to state their religious preference, 83,003; unspecified, 36,114. The principal Christian denominations were: Church of England, with 1,710,443 adherents; Roman Catholic Church, 921,425; Presbyterian, 558,336; Methodist, 547,806; Baptist, 97,074; Congregationalist, 74,046; Lutheran, 72,395; Church of Christ, 38,748.

Illiteracy is not common in Australia. At the 1911 census, persons of five years of age and upwards numbered 4,019,372; of these, 139,749 were not able to read, and 95,727 were not recorded in respect of literacy.

In 1915 there were 3480 government schools in New South Wales, with 7890 teachers and 265,446 pupils; and 718 private schools, with 3682 teachers and 78,619 pupils. Victoria had 2227 government schools, with 6085 teachers and 250,264 pupils; private schools, 509, with 1879 teachers and 52,638 pupils. Queensland had 1463 government schools, with 3828 teachers and an average attendance of 86,540; private schools, 147, with 748 teachers and an average attendance of 14,404. South Australia in 1914 had 839 government schools, with 60,729 pupils; private schools, about 170, with upwards of 11,000 pupils. Western Australia in 1915

had 622 government schools, with 45,956 pupils and an average attendance of 39,970; private schools, 124, with 10,972 pupils and an average attendance of 9532. In 1915 Tasmania had 455 public elementary schools, with 35,355 pupils, besides 16 superior schools, several high and technical schools, and about 90 private schools. There is a university at each of the six capital cities;—the teaching staff at Sydney in 1915 numbered 162 and the students 1798; at Melbourne there were 1315 students; at Adelaide, in 1913, 720 students (exclusive of 318 music students); at Brisbane, in 1915, 206 students; at Perth and Hobart respectively in 1913, 182 and 162 students.

**AGRICULTURE.** The final estimates for cereal crops in 1915-16 and the preliminary estimates for 1916-17 are as follows, in hectares and metric quintals:

	Hectares		Metric Quintals	
	1915-16	1916-17	1915-16	1916-17
Wheat ...	5,070,882	5,071,000	48,886,518	89,048,000
Rye .....	4,000	4,000	34,000	84,000
Barley ..	69,000	73,000	862,000	912,000
Oats ....	298,221	298,000	2,987,120	3,012,000
Corn ....	181,000	129,000	1,727,000	2,159,000

The percentage of area planted and of production in 1916-17 as compared with the five-year average in the period 1909-10 to 1913-14 was as follows: Wheat, 164.8 per cent for area and 158.5 per cent for production; rye, 111.8 and 126.2; barley, 116.9 and 138.7; oats, 97.2 and 119.8; corn, 90.2 and 84.3. The yield of wheat per hectare in 1916-17 was 7.7 quintals, and the average yield in 1909-10 to 1913-14 was 8.0 quintals; rye, 8.5 and 7.5; barley, 12.5 and 10.5; oats, 10.3 and 8.3; corn, 16.7 and 17.9.

The area under crop in Australia in 1914-15 was 15,651,974 acres, as compared with 14,683,012 in 1913-14 and 10,972,299 in 1909-10. These areas do not include lands under permanent artificially sown grasses, which amounted to 3,206,362 acres in 1913-14. The value of the agricultural production in 1914-15 was estimated at £36,052,396.

By far the most important crop is wheat. The yield fell from about 103,344,000 bushels in 1913-14 to about 24,892,000 bushels in 1914-15 and increased to about 179,620,000 bushels in 1915-16. In acres and bushels the area and production of wheat is shown below by States in 1913-14 and 1914-15:

	Acres		Bushels	
	1913-14	1914-15	1913-14	1914-15
N. S. W.*	3,205,397	2,758,024	88,020,381	12,830,580
Vic. ....	2,565,861	2,868,535	82,886,245	3,940,947
Qld. ....	182,655	127,015	1,769,432	1,585,067
S. A. ....	2,267,851	2,502,680	16,986,658	5,527,428
W. A. ....	1,097,193	1,878,012	13,551,850	2,624,190
Tas. ....	18,432	23,865	849,736	384,220
Cwth.	9,287,398	9,651,081	103,344,132	24,892,402
1912-13	7,899,651	.....	91,981,070	.....
1911-12	7,427,824	.....	71,888,847	.....
1908-9	5,262,473	.....	62,590,966	.....
1901-2	5,115,965	.....	38,561,619	.....

\* Including Federal Territory.

The production of oats and corn in bushels and of hay and sugar cane in tons, and the total area in acres of these crops, were as follows in 1913-14 and 1914-15:

	Area		Production	
	1913-14	1914-15	1913-14	1914-15
Oats .....	859,020	774,784	15,232,048	4,841,104
Corn .....	381,879	339,781	9,178,821	8,455,561
Hay .....	2,754,672	2,628,618	3,872,596	1,738,944
Cane .....	180,976	172,616	2,271,568	2,104,289

After wheat the most important crop is hay, of which a very large proportion is cereal grasses; in New South Wales, South Australia, and Western Australia the principal hay crop is wheaten and in Victoria oats. Other crops are green forage, potatoes, grapes, fruit, and vegetables. Sugar cane is grown for sugarmaking only in Queensland and New South Wales, and much more extensively in the former than in the latter.

**GRAZING.** Australia has a leading place as a sheep raising country, but in recent years the number of sheep has declined. The estimated number of sheep in New South Wales June 30, 1916, was 32,553,000; cattle, 2,405,000; horses, 720,000; and swine, 280,000. Reported live stock in Victoria March 31, 1916: sheep, 10,545,632; cattle, 1,043,604; horses, 493,779; swine, 192,002. In Queensland the reported number of sheep in 1914 was 23,129,919 and in 1915, 15,950,154, the decrease being largely in consequence of the dry season; cattle, 5,455,943 and 4,780,893; horses, 743,059 and 686,871; swine, 166,638 and 117,787. Reported live stock in South Australia December 31, 1915: sheep, 3,674,547; cattle, 226,565; horses, 253,333; swine, 66,237. The reported number of sheep in Western Australia at the end of 1915 was 4,803,850; cattle, 821,048; horses, 163,006; swine, 58,231. A report for Tasmania March 1, 1916, places the number of sheep at 1,624,450; cattle, 169,575; horses, 41,422; swine, 37,778. Live stock as reported for the Northern Territory December 31, 1915: sheep, 57,827; cattle, 483,961; horses, 19,957; swine, 500. As reported for the Commonwealth, there was a total of 69,693,375 sheep and of 9,993,743 cattle at the end of 1915. Sheep in the several States have been as follows, in thousands:

	1911	1912	1913	1914

Estimated wool production, stated as in the grease, in the year 1914-15, 641,786,519 pounds, as compared with 711,134,203 pounds in 1913-14 and 648,851,913 pounds in 1912-13. The share of New South Wales (including Federal Territory) in 1914-15 was 318,935,000 pounds; Queensland, 165,478,740 pounds in the calendar year 1914 and 130,783,277 pounds in 1915; Victoria, 95,406,867 pounds in 1914-15; South Australia, 38,848,978 pounds; Western Australia, 24,562,110 pounds; Tasmania, 8,154,824 pounds; Northern Territory, 400,000 pounds.

**MINING.** Mineral production in the Commonwealth (exclusive of building stone, slate, cement, etc.) was valued in 1915 at £22,396,762, including: gold, £8,270,339; coal, £4,277,592;

copper, £3,035,890. Australia's total gold production up to the end of 1915 is reported at £572,487,653. The table below shows by States the value of important minerals produced in 1914, the total for all minerals produced in 1913 and 1914, and the grand total of mineral production from the beginning of mining to the end of 1914:

\* Silver and lead.

The Commonwealth is one of the leading gold-producing countries of the world. The principal output is in New South Wales, Victoria, and especially, in recent years, Western Australia. The largest total gold production was in 1903, when the output was valued at £16,294,684; since that year the annual output has steadily declined.

**COMMERCE.** During the first year of the great war the Australian foreign trade showed a marked decline in both imports and exports of merchandise; but in the year 1915-16 there was a fair recovery, although the exportation of many articles was prohibited or restricted to British dominions or countries of the Allies. The trade, including specie and bullion, is shown in the table below, which distinguishes total imports, domestic exports (that is, exports of Australian produce), and total exports. The figures for 1914 are for the first six months only; in that year the trade year was changed from the calendar year to the year ending June 30.

	Total Imports	Domestic Exports	Total Exports
	£	£	£
1905 .....	88,346,781	54,127,758	56,841,095

1914* .....	39,777,497	86,265,764	87,980,067
1914-15 .....	64,481,887	58,122,578	60,592,578
1915-16 .....	77,398,516	71,880,279	74,775,025

\* First six months only.

Imports and exports of specie and bullion in 1912 amounted to £1,675,240 and £12,461,600 respectively; in 1913, £1,553,544 and £3,798,735; in 1914 (first six months), £866,033 and £1,612,277; in 1914-15, £868,056 and £2,907,666.

Leading imports in 1914-15 and 1915-16 respectively have been reported as follows, in

thousands of pounds sterling: metal manufactures, 9433 and 9695; cotton and linen piece goods, 4268 and 5350; apparel, 3578 and 4048 (exclusive of hats and caps, 412 and 417; and boots and shoes, 624 and 381); drugs, chemicals, and fertilizers, 2426 and 3001; woollens, 1850 and 2889; machines and machinery, 3501 and 2851; oils in bulk, 1893 and 2454; silk piece goods, 2082 and 2396; bags and sacks, 1552 and 1983; paper, 1739 and 1994; tea, 1529 and 1940; timber, 2150 and 1719; spirits, 1291 and 1149; tobacco, 902 and 989.

Principal exports in 1914-15 and 1915-16, in thousands of pounds sterling: wool, 22,088 and 26,854; gold specie, 1941 and 9517; gold bullion, 480 and 841; gold in matte, 204 and 197; wheat, 859 and 7998; copper matte, ingots, bars, and ore, 2303 and 3591; lead, pig and in matte, 2009 and 3194; skins and hides, 3522 and 2429; beef, 4990 and 2176; flour, 509 and 1739; zinc concentrates, 613 and 1307; leather, 1183 and 1137; butter, 2687 and 1118; mutton and lamb, 3414 and 770; rabbits and hares, 532 and 725; tin ingots, 226 and 577; tin ore, 187 and 244; coal, 721 and 508; tinned meat, 1854 and 501; tallow, 1571 and 444; silver bullion, 433 and 367; silver in matte and silver ore, 322 and 339.

Trade with the more important countries, in thousands of pounds sterling:

In the direct foreign trade, imports to and exports from the several States were as follows in 1915-16: New South Wales, £33,379,698 and £40,972,824; Victoria, £26,654,080 and £14,728,401; Queensland, £7,000,912 and £8,106,123; South Australia, £5,150,710 and £6,136,085; Western Australia, £4,168,443 and £4,198,520; Tasmania, £982,849 and £612,119; Northern Territory, £61,824 and £20,953; total £77,398,516 and £74,775,025.

**SHIPPING.** The number of vessels, with cargo and in ballast, and the net tonnage entered and cleared, in the foreign trade have been as follows:

	Entered		Cleared	
	Vessels	Tons	Vessels	Tons
1906 .....	.....	4,006,145	.....	3,990,518
1911 .....	2,081	4,998,220	2,098	4,991,581
1912 .....	2,085	5,168,857	2,017	5,111,957
1913 .....	2,014	5,871,581	1,971	5,280,417
1914-15 .....	1,568	4,174,955	1,643	4,424,303
1915-16 .....	1,654	4,269,484	1,670	4,268,838

Vessels entered according to nationality, in 1915-16: British, 691, of 2,661,946 tons; Australian, 337, of 552,782 tons; New Zealand, 167, of 261,783 tons; American, 177, of 198,902 tons; French, 57, of 89,160 tons; Norwegian, 51, of 81,945 tons.

Australian merchant marine in 1915: steamers, 1166, of 324,776 tons net; sail, 1337, of 52,398 tons net; total, 2503 vessels, of 377,174 tons net.

**COMMUNICATIONS.** The reported length of Australian railway in 1915 open to public traffic was 21,205 miles, including private railways totaling 1143 miles. In addition, there were private railways not open to general traffic aggregating 1058 miles; so that the total mileage in operation was 22,263. The table below shows the length and the cost of construction and equipment of Commonwealth and State lines up to June 30, 1915, and their gross receipts and working expenses for the year then ended:

	Miles	Cost	Receipts	Expenses
Cwth. ..	1,193	\$6,087,484	\$229,585	\$285,553
N. S. W. ..	4,184	64,008,486	7,616,511	5,311,162

Tas. ....	588	4,628,911	328,265	225,995
Total..	20,062	\$219,227,801	\$20,966,059	\$15,409,121

The 1193 miles of Commonwealth line given in the foregoing table include: Kalgoorlie-Port Augusta line, 564 miles, the portion constructed up to June 30, 1915; Port Augusta-Oodnadatta line, 478 miles; Palmerston-Pine Creek line (in the Northern Territory), 146 miles; Canberra, 5 miles. The Port Augusta-Oodnadatta line and the Palmerston-Pine Creek line are the southern and northern sections respectively of the projected north-and-south transcontinental railway. This establishes rail communication from Longreach via Rockhampton, Maryborough, Gympie, and Brisbane, in Queensland, via Tamworth, Newcastle, Sydney, Goulburn, and Wagga Wagga, in New South Wales, via Melbourne and Ballarat, in Victoria, via Adelaide and Port Augusta, in South Australia, via Kalgoorlie, Coolgardie, and Perth to the seaport of Fremantle, in Western Australia.

In Australia new railway legislation was rendered necessary by the completion of the East-West Transcontinental line. The Commonwealth then had three important lines—the East-West Transcontinental, with a length of 1053 miles; the Port Augusta to Oodnadatta, 478 miles; and the Darwin to Katherine River, 200 miles. Hitherto these lines had been operated in three different ways and a Commonwealth Railway Bill was introduced to bring them under uniform control. The measure provided for non-political control by a Commissioner, presumably Mr. N. G. Bell, the acting Commissioner—who was to be appointed for five years at a salary not greater than £2000 a year. In commenting on the proposals, the *Melbourne Age* said that the most important feature was the provision which did away with the pernicious system of political control.

The completion of the Australian Transcontinental Railway was marked by the running of the first train on October 20, 1917. This connecting link extends a distance of 1053 miles from Kalgoorlie in Western Australia to Port Augusta in Southern Australia. It was an important feature in the development of the Commonwealth idea in 1900, and was insisted upon by the State of Western Australia, which had considered itself cut off from the more populous

cities in the east. The preliminary survey for this railroad was made in 1909 and the first sod of the eastern end was turned in 1912, and that of the western end in February, 1913. At least 800 miles of the route were entirely uninhabited, and great water difficulties were experienced. Throughout the whole distance there was no surface water, so that an important part of the undertaking was the construction of reservoirs, which were placed at intervals along the line. The original estimate made in 1911 was £4,045,000, but this amount was greatly exceeded and before ultimate completion would probably be increased to £7,000,000. The line was constructed for high speed and heavy rolling stock, so that eventually the trip from Port Augusta to Kalgoorlie could be made in 24 hours, although it was not contemplated at the outset to make the journey in less than 25 hours. The new railway was of standard gauge, 4 feet 8½ inches, so that it was impossible to run through trains from Perth on the coast of Western Australia and Adelaide and Melbourne in South Australia and Victoria, where the gauge of 3 feet 6 inches was used. The locomotives and rolling stock introduced in this line afforded a most modern type and represented the best practice in railway construction.

In Australia as elsewhere increased expenses were being felt by the State railways and on the recommendation of P. R. Johnson, an English railway expert, who had been investigating the causes of the unfavorable financial condition, increased freight rates and passenger fares were adopted.

**FINANCE.** Commonwealth revenue and expenditure are reported as follows for fiscal years ending June 30:

	1913-14	1914-15	1915-16
Revenue	£	£	£
Customs .....	12,652,736	12,105,698	13,621,471

The first portion of the debt of the Commonwealth government was contracted at the beginning of 1911, when it assumed responsibility, from South Australia, for the outstanding liabilities of the Northern Territory and the Port Augusta-Oodnadatta Railway. As reported for March 1, 1916, the total Commonwealth debt, including properties transferred from States and war loans incurred, was as follows: Common-

wealth inscribed stock (3¼ per cent), £4,580,000; Commonwealth inscribed stock and bonds (4½ per cent war loan), £35,045,020; war loan from British Government, £29,978,416; Commonwealth treasury bills, £4,290,719; South Australia debt transferred, £4,690,034 (on account of the Northern Territory, £2,778,266; on account of the Port Augusta-Oodnadatta Railway, £1,911,768); total, £89,361,350.

The table below shows State revenue and expenditure, exclusive of loans and expenditure therefrom, in thousands of pounds sterling:

	Revenue		Expenditure	
	1914-15	1915-16	1914-15	1915-16
N. S. W. ....	18,928	19,629	17,928	18,932

W. A. ....	5,141	5,857	5,707	5,705
Tas. ....	1,244	1,376	1,384	1,341

\* Figures for 1915-16 are estimates.

Public debts of the States June 30, 1916: New South Wales, £130,514,018; Victoria, £72,183,927; Queensland, £58,261,136; South Australia, £37,743,289; Western Australia, £39,139,676; Tasmania, £13,908,913. See PRICES.

**NAVY.** The royal Australian navy, under control of the British Admiralty in time of war, includes the following vessels:—battlecruiser, *Australia* (19,200 tons); light cruisers: *Encounter* (5880 tons), *Melbourne* (5600 tons), *Pioneer* (2200 tons), *Sydney* (5600 tons), *Brisbane* (5600 tons); torpedo boat destroyers: *Derwent*, *Torrens*, *Svan*, and *Parramatta*, each of 700 tons; and several gunboats, torpedo boats, etc.

**GOVERNMENT.** The Commonwealth of Australia is a federal state within the British Empire. The legislative power is exercised by a parliament of two chambers, the Senate and the House of Representatives. Senators, 36 in number (6 from each State), are elected for six years; representatives, 75 in number, for three years—all by universal adult (male and female) suffrage. On the basis of the 1911 census, New South Wales has 27 representatives; Victoria, 21; Queensland, 10; South Australia, 7; Western Australia and Tasmania, each 5. No State may have less than 5 representatives. The executive authority is vested in the British sovereign acting through a governor-general, whom the sovereign appoints and who is assisted by a responsible ministry, the executive council. The governor-general in 1917 was Sir Ronald Craufurd Munro-Ferguson, G.C.M.G. The ministry formed February 15, 1917, was as follows: prime minister and attorney-general, William Morris Hughes; minister for home affairs, P. Mc. Glynn; defense, George Foster Pearce; trade and customs, Jens August Jensen; navy, J. Cook; postmaster-general, W. Webster; treasurer, Sir J. Forrest, G.C.M.G.; public works and railways, W. A. Watt; assistant attorney-general, L. E. Groom; vice-president of the executive council, E. D. Millen; honorary minister, Edward John Russell.

Each of the six Australian States has a parliament of two chambers elected, like the federal parliament, by universal adult suffrage. The State parliaments have legislative power in respect of matters not transferred by the constitution to the federal parliament. Each State

is administered by a governor, who is appointed by the crown and is assisted by a responsible ministry.

#### HISTORY

**THE ELECTIONS.** Since November, 1916, when the government's conscription bill was defeated at the polls there had been a bitter political conflict. The Prime Minister of the Commonwealth, Mr. William M. Hughes, driven from the leadership of the Federal Labor party, placed himself at the head of the movement for conscription. A meeting was held at Melbourne early in January of leading men in politics and business who decided upon a new organization which should be a national party and make the winning of the war the dominant issue, to which everything else should be subordinate. Its other objects were the development of Australian national life; the maintenance of imperial solidarity; the insistence upon a Commonwealth parliament which should fully represent the nation in these respects; and the subordination of party issues to these central purposes. On February 19 the Prime Minister resigned but was immediately requested by the governor-general to form a new coalition cabinet. This he did, giving to Mr. J. Cook, the leader of the opposition, the portfolio of Minister of the Navy. The title of the new ministry was to be the Commonwealth War Government. The political conditions in Australia were so difficult that the Prime Minister was unable to attend the imperial conference at London where, accordingly, Australia was not represented. As the elections approached it seemed certain that the Labor party would be overthrown, for everywhere it had been losing ground. This expectation was fully realized. The election which was held in May turned mainly on the issue of the "Winning the War" policy and the rout of the Labor party was complete. They were partially defeated even in their stronghold, Queensland, where the Labor government's referendum on the abolition of the upper house of the State parliament was defeated by a large majority. The Government gained a complete victory in the lower House, and in the Senate the Labor party lost every seat. It was described as the most complete defeat ever inflicted upon a political party since the creation of the Commonwealth. In spite of its defeat the Labor party, which was compactly organized under a few leaders of extreme views, continued in its policy of opposition. In July the Victoria State Labor Conference passed by a vote of 112 to 52 a resolution for the abolition of compulsory military training, and the Melbourne Trades Hall Council on July 19, voted that Labor members of Parliament should refuse to assist in recruiting.

**SOLDIERS' SETTLEMENT.** There was much discussion of plans for the settlement of soldiers in Australia after the war. It was argued that Australia was by the necessity of her situation an exporter of food and an importer of men; that she needed an independent population on the soil. She would be under the necessity of resettling all the soldiers who had gone over-seas to fight. Since, under the present constitution, all the lands are the property of the individual States these States must be concerned in any scheme for land settlement. A conference of the various governments of the Commonwealth was held in January and a scheme was for-

mulated. The principal feature of this was that the British and Australian soldiers were to have equal treatment. A government board entitled the Soldiers' Settlement Board was appointed, consisting of a minister from each State and a minister representing the Commonwealth. The recommendations made by this board were as follows:—1st. Financial aid to be advanced to the soldier settlers. 2nd. The working out by the board of the purposes for which these advances were to be made and the conditions under which that rate was to be paid. The money was to come from the Commonwealth government but was to be advanced through existing State institutions, such as agricultural banks, etc. The plan was to make these advances at very reasonable rates. The Commonwealth, moreover, was to provide the money to enable the settler to begin his occupancy of the land. Already in February, 1917, the respective governments had acquired large areas of land.

**WOMAN'S WORK.** In the beginning of 1917 the employment of the women had greatly increased. No new industries were created for them, but they replaced men in callings that were suited to them. In the factories there was no especial increase in the number. Nor was their number increased very much outside the cities. They were employed frequently as clerks in shops and even in the banks. It was estimated that two-thirds of the places held by the 300,000 men who were called to the colors were filled by women.

**STRIKES.** In August strikes occurred among the employees of the railway shops of Sydney, on the ostensible ground that the card system employed by the Railways Commissioners was unfair to the men. In consequence, many unions in New South Wales as well as in the other States went out on sympathetic strike, causing an almost complete stoppage of shipping. The government resorted to volunteers, and thousands of men left work refusing to touch any material into which volunteer labor had entered. The strike turned out, however, to be a complete failure and after a few weeks' idleness the men returned to work, so that by the end of September there seemed a prospect of prolonged industrial peace. On July 30 the wharf laborers of Victoria went on strike. Allied Trades followed their example, and the strike spread to other States. In August the shipping industry was seriously impeded and Newcastle in New South Wales suffered a falling off in its coal supplies. As a result of the strike many were thrown out of work.

**INDUSTRIAL REORGANIZATION.** As to the future policy of Australia, especially in the matter of organizing trade with the empire, Mr. Hughes at the end of October outlined the measures required. Pointing to the great results achieved by organization in Great Britain he declared that the same methods must be imitated in Australia. The country was now receiving from Great Britain tens of millions of pounds for the purchase of products not yet delivered. The inflation that resulted from this would suddenly collapse at the close of the war. A plan must be devised to meet this danger. Hitherto the country had concerned itself only with individuals and not with industry as a whole. Germany had taken the other course and henceforth this would be necessary for Aus-

tralia, because production was a national function, and therefore should proceed along business lines aided by the best scientific knowledge, supported financially and backed by the entire community. Thereupon he briefly outlined a plan which consisted in—1st, an association representing each industry; 2nd, a general council of commerce consisting of representatives of each of these associations; 3rd, a department of trade; 4th, a science bureau; 5th, trade representation for the chief over-sea markets. The association should supervise the cost of production and give information in regard to markets, thus aiding the individual to produce at the lowest cost and to find the best market. The banks could take a hand in developing industries because they could loan more widely, the credit of the Commonwealth being behind the enterprise. The science bureau ought to be associated with the most important technical schools, universities, and colleges.

**CONSCRIPTION REFERENDUM CAMPAIGN.** It was evident to many that the voluntary system in Australia was a failure and finally on October 31 it was announced that the cabinet would soon consider a change of policy. At that time 380,000 soldiers had been sent over-seas. On November 8 the Federal cabinet unexpectedly announced that a second referendum would be held on the subject of conscription. In general the press supported it enthusiastically, but there was a good deal of uncertainty as Queensland was opposed to it and as it was doubtful whether it could be carried in New South Wales. It was thought that the result would be determined largely by the women's vote. The date for the vote on it was fixed for December 20. The vote as counted down to December 30 was 1,121,000 against and 945,000 for conscription.

It was announced on December 6 that the Commonwealth government had introduced a war loan bill for £80,000,000 of which £20,000,000 was to be floated in Australia at once. The loan was to bear interest at 4½ per cent, to be exempt from income tax, and to be payable in ten years.

**AUSTRIA-HUNGARY**, or the **AUSTRO-HUNGARIAN MONARCHY**. A central European monarchy, consisting of the Austrian Empire, the Hungarian Kingdom, and the territory of Bosnia and the Herzegovina. The common terms "Austro-Hungarian Empire" and "Empire of Austria-Hungary" are misnomers. Vienna is the capital of Austria and the permanent residence of the sovereign; Budapest is the capital of Hungary. In these cities the examining and advisory body known as the Delegations, acting for Austria and for Hungary in respect of their common affairs, convenes alternately.

**AREA AND POPULATION.** The Austro-Hungarian monarchy has an area of 261,241 square miles, which is somewhat smaller than the combined extent of Nebraska, Kansas, and Colorado. The Austrian Empire embraces 115,832 square miles, or about twice the area of Michigan. The Hungarian Kingdom covers 125,641 square miles, an area a little larger than Iowa and Missouri. The Austrian Empire consists of seventeen crownlands, as follows: Bohemia (q.v.), the Bukowina (q.v.), Carinthia (q.v.), Carniola (q.v.), Dalmatia (q.v.), Galicia (q.v.), Górz and Gradišca (q.v.), Istria (q.v.), Lower Austria, Moravia, Salzburg, Silesia, Styria, Tirol

(q.v.), Trieste, Upper Austria, and Vorarlberg. The Hungarian Kingdom consists of Hungary proper and of Croatia and Slavonia (q.v.). Transylvania (q.v.) is sometimes not regarded as a part of Hungary proper, as so much of its population is non-Magyar. The population of the monarchy in 1916 was probably in excess of 52,500,000. The table below shows the area and the population according to the census of December 31, 1900, and the last census, that of December 31, 1910. The figures for Bosnia and the Herzegovina (q.v.) are returns of the census of April 22, 1895, and the census of October 10, 1910. Bosnia and the Herzegovina, formerly Ottoman provinces, were not annexed to Austria-Hungary until October 5, 1908; hence, the population of the monarchy as constituted in 1900 was 45,405,267.

	Square miles	Population 1900	1910
Austrian Empire.....	115,832	26,150,708	28,571,934

Monarchy .....	261,241	46,996,308	51,890,223

\* Census of April 22, 1895.

† Census of October 10, 1910.

Austria-Hungary is one of the most remarkable countries in the world in respect of ethnical composition. Diversity of race and language and the corresponding national aspirations of the peoples have always been elements of insecurity in the coalition of the monarchy. The dominant race in Austria is German-speaking, and in Hungary Magyar-speaking, but the German- and Magyar-speaking elements combined form only about 44 per cent of the total population. It is these two elements that have given willing support to Germany in the great war. Doubtless under the menace of foreign invasions some of the other elements have shown more or less adhesion to the monarchy as a whole, but in general it is only the two elements mentioned that have been regarded as real enemies of the Entente. Below is shown the population as returned by the 1910 census according to vernacular (the figures for the monarchy are exclusive of the military in Bosnia and the Herzegovina, numbering 33,758):

	Austria		Hungary Proper	
	No.	Per cent	No.	Per cent

\* Including foreigners, of whom about 300,000 Magyars.

The civil population of Bosnia and the Herzegovina is included in the foregoing table under "Monarchy." The principal linguistic element in this population is Croatian and Serbian, being represented by 1,822,564 persons.

Austria-Hungary is an overwhelmingly Catholic country. The following table shows, according to the 1910 census, the number of Roman Catholics, Greek and Armenian Catholics, Evangelicals, adherents of the Eastern or Orthodox Church, Jews, and Moslems (exclusive of the military in Bosnia and Herzegovina):

Austria	Hungary	Bos. Her.	Monarchy
R. Cath. 22,530,169	10,888,188	484,061	33,852,368
Gr. & Ar. 3,419,458	2,025,425	8,186	5,453,102
Evangel. 588,686	3,961,472	6,842	4,556,500
Orthodox. 667,065	2,987,163	825,418	4,479,646
Jews ... 1,813,687	982,458	11,868	2,858,013
Moslems. 1,446	.....	612,187	613,588
Others .. 51,428	91,748	82	143,258
Total 28,571,934	20,886,487	1,898,044	51,856,465

Males numbered in 1910, 25,407,965 and females 25,982,258. In Austria, there were 14,034,022 males and 14,537,912 females; in Hungary, 10,345,333 and 10,541,154; in Bosnia and the Herzegovina, 1,028,610 and 903,192.

In Austria, there were in 1913 195,524 marriages, 863,690 living births, and 588,654 deaths (exclusive of stillbirths); in Hungary, 195,030, 735,626, and 500,875.

The larger communal populations in Austria according to the 1910 census were: Vienna, 2,031,498; Prague, 223,741; Lemberg, 206,113; Trieste, 160,993; Cracow, 154,141; Graz, 151,781. In Hungary, the larger communal populations (and in parenthesis the city populations) were: Budapest, 880,371 (710,172); Szeged, 118,328 (77,797); Szabadka, 94,610 (48,140); Debreczen, 92,729 (54,325); Zagr b, 79,038; Pozsony, 78,223 (67,977); Temesv r, 72,555 (70,637).

**EDUCATION.** Elementary instruction, in both Austria and Hungary, is free and compulsory. Children are taught in the language or languages predominating in their communities. Statistics of elementary education in Austria are not available later than for the year 1912. In that year there were 23,247 elementary schools, with 107,374 teachers and 4,471,393 pupils; children of school age numbered 4,947,724.

Secondary education in Austria is provided chiefly by the gymnasia and realschulen. These have been reported as follows:

	Gymnasia		Realschulen	
	No.	Students	No.	Students
1912-13 .....	843	108,888	148	49,151
1913-14 .....	370	111,861	148	48,892
1914-15 .....	872	111,640	148	47,765
1915-16 .....	876	84,907	148	44,230

The number of gymnasia given above included 32 for girls in 1912-13, with 4797 students; in 1913-14, 40, with 5871 students; in 1914-15, 40, with 5997 students; in 1915-16, 41, with 4818 students. German was the language used in 146 of the gymnasia in 1915-16; Polish, 107; Bohemian, 73; Ruthenian, 16; Italian, 9; Serbo-Croatian, 7; Slovene, 2; in 16, two languages. Besides the 41 gymnasia for girls there were in 1915-16 75 lyceums for girls, with 10,528 students.

Austria has seven government technical high schools. Statistics of these schools and of the Vienna agricultural high school are shown below for the winter semester of 1915-16, as compared with the winter semester of 1913-14:

	Teachers		Students	
	1913-14	1915-16	1913-14	1915-16
Vienna .....	183	8,177	639	146
Prague { German .....	86	900	146	146
{ Bohemian .....	151	2,817	848	848
Lemberg .....	98	1,791	167	167
Br�nn { German .....	102	924	115	115
{ Bohemian .....	78	569	133	133
Graz .....	54	814	80	80
Vienna agr. high school...	86	1,135	186	186
Total .....	838	12,127	2,814	2,814

In Austria, eight universities are maintained by the government. The number of students in the winter semester of 1911-12 was 29,417, and in the summer semester of 1912 26,556. As may be seen in the table above, the great war caused an enormous decline in the number of students at the technical high schools. The same is true of the university attendance; the following figures indicate the number of university students in the summer semester of 1912 and the summer semester of 1916: Vienna (German), 8780 and 3472; Prague (German), 1781 and 638; Prague (Bohemian), 4089 and 1891; Lemberg (Polish), 5062 and 1174; Graz (German), 1882 and 647; Innsbruck (German), 1264 and 584; Czernowitz (German), 1162 and 188; Cracow (Polish), 2536 and 1281; total, 26,556 and 9875. Educational statistics later than those given in the 1916 YEAR BOOK are not available for Hungary.

**AGRICULTURE.** On account of the great war, the publication of agricultural statistics has been discontinued, and very little information is available later than for the year 1914. In respect of vegetable foodstuffs, the monarchy is approximately self-supporting. Thus, in 1913, while the importation of grain, pulse, flour, etc., was valued at 133,951,000 kronen, the exportation of these articles amounted to 115,172,000 kronen. But although virtually able to supply her own food needs in peace times, Austria-Hungary has failed to do so in war. The immense drain on her man power, invasion, and the general disorganization of economic conditions have brought about a situation in which many of her people have suffered a grievous lack of food. Some idea of agricultural production is afforded by the following figures,

which represent, in metric quintals, the average annual yield in Austria and Hungary respectively: wheat, about 16,072,000 and 46,072,000; rye, 28,763,000 and 12,759,000; corn, 3,988,000 and 45,330,000; barley, 16,322,000 and 15,070,000; sugar beets, 83,871,000 and 30,353,000; potatoes, 132,848,000 and 52,864,000; tobacco, 66,950 and 676,350.

**MINING AND METALS.** For Austria the latest available definite information concerning the production of minerals and metals are for 1913; this was published in the 1915 and 1916 volumes of the *YEAR BOOK*. The total value of Austrian mining products (exclusive of salt, petroleum, etc.), was 371,442,426 kronen in 1913, and of furnace products 181,607,752 kronen.

In Hungary, the value of mining and furnace products in 1913 was 185,657,000 kronen. The reported steel production in 1915 amounted to 688,267 metric tons, as compared with 623,468 in 1914. Some of the more important mineral and furnace products were valued as follows in 1913 and 1914 respectively: lignite, 88,257,000 and 81,715,000 kronen; pig iron, 53,956,000 and 40,254,000; coal, 14,394,000 and 13,448,000; gold, 9,586,000 and 8,804,000; iron ore for export, 5,816,000 and 4,228,000; silver, 820,000 and 830,000.

**COMMERCE.** In the special trade of the common customs territory, imports in 1913 were valued at 3,406,592,000 kronen, and exports at 2,769,688,000 kronen. Details of this commerce were given in the 1915 *YEAR BOOK*. The 1914 trade was valued at about 2,754,000,000 kronen for imports and 2,015,900,000 for exports. The great war has all but ruined Austria-Hungary's foreign trade except with her allies. No approximate information as to the volume or details of this commerce is now available. There remains a fairly large commerce forced upon Rumania; if peace with Russia, which at the end of 1917 seemed not improbable, be established, active commercial relations will be resumed with that country. A rough idea of the decline of the monarchy's foreign trade may be obtained by noting the figures for Austria-Hungary in the commerce paragraphs of the articles on various countries in this book.

**SHIPPING.** In 1914, there were entered at Austrian seaports 132,365 vessels, of 19,350,194 tons (173,511, of 27,877,722 tons, in 1913); and cleared 132,000 vessels, of 19,071,589 tons (173,377, of 27,857,112 tons, in 1913). Of the 1914 tonnage about 92 per cent was Austro-Hungarian, Italian ranking second and Greek third. Entered at Hungarian seaports in 1913, 31,857 vessels, of 4,930,905 tons; cleared, 31,836, of 4,924,734 tons. Trieste, in Austria, and Fiume, in Hungary, are the principal merchant seaports. The chief Austro-Hungarian naval base is Pola. See *ISTRIA*.

**COMMUNICATIONS.** The Danube River and its affluents are important avenues of transportation. In 1913, canals and rivers navigable for steamers aggregated 3151 miles, of which 974 miles in Austria and 2177 miles in Hungary. At the beginning of 1914, the length of railway in operation was 29,328 miles, of which 14,781 miles in Austria, 13,589 miles in Hungary, and 958 miles in Bosnia and the Herzegovina. Railway open to traffic in Hungary in 1915 is reported at 13,671 miles.

Telegraph lines in Austria in 1915, 30,226 miles, with 160,725 miles of wire; telegraph

lines in Hungary in 1914, 16,740 miles, with 103,540 miles of wire; telegraph lines in Bosnia and the Herzegovina in 1914, 2202 miles, with 6625 miles of wire. Post offices: in Austria in 1915, 10,126; in Hungary in 1914, 6774; in Bosnia and the Herzegovina in 1914, 249.

**FINANCE.** The legal standard of value is gold. The monetary unit is the krone (crown). Its par value is 20.263 cents; its actual value in 1917 was much less. A circular of the U. S. Director of the Mint dated October 1, 1917, stated that there were no market quotations for the krone, but that it had greatly depreciated. The cost of administering the common affairs of the monarchy is borne by Austria and by Hungary in a proportion agreed to by their parliaments and sanctioned by the emperor-king. The agreement renewed for ten years in 1907 provides that the net proceeds of the common customs be applied to the common expenditure, and that the remaining expenditure be satisfied in the proportion of 63.6 per cent for Austria and 36.4 per cent for Hungary. The budget, as reported for the fiscal year 1915, balanced at 790,578,808 kronen.

In Austria, the budget for the fiscal year 1915 showed estimated revenue and expenditure of 3,460,987,902 and 3,460,726,156 kronen respectively. In Hungary, estimated revenue and expenditure for the fiscal year 1915 were 2,264,157,883 and 2,264,096,830 kronen respectively. In Bosnia and Herzegovina, the provisional budget for the fiscal year 1917 showed estimated revenue of 118,598,602 kronen and estimated expenditure of 118,573,512 kronen.

According to the terms under which the union of Austria and Hungary was effected in 1867, no debts are contracted by the common government. The total general debt, contracted before the union, amounted on January 1, 1915, to 5,124,820,435 kronen. The debt of Austria increased from 7,467,346,388 kronen on January 1, 1914, to 12,836,044,942 kronen on January 1, 1915; and it has been reported that the Austrian on July 1, 1916, reached a total of 36,027,834,685 kronen, of which 24,552,502,438 kronen were war debt. The debt of Hungary, including arrears and outstanding paper, amounted in 1912 to 6,592,846,069 kronen, of which about 5,329,460,000 kronen were the funded debt. This debt, like the Austrian debt, has increased enormously during the great war.

**GOVERNMENT.** Under the constitutional compromise of 1867, whereby the Austrian Empire and the Hungarian Kingdom were united to form the Austro-Hungarian Monarchy, the administration of the monarchy is directed by the emperor-king, acting through three ministers, whom he appoints, for foreign affairs, finance, and war. The "emperor-king" is emperor of Austria and king of Hungary. The three common ministers are responsible to the two Delegations; these bodies, consisting of 60 members each, are chosen annually from the Austrian and Hungarian parliaments respectively and convene each year, alternately at Vienna and Budapest. They have no legislative function, but examine the requirements of the common services of the monarchy and advise the two parliaments as to needed legislation. The common government deals with finance relating to the monarchy as a whole, foreign affairs, the diplomatic, consular, postal, and telegraphic services, certain state monopolies, and military

and naval affairs. It is only the active army that is under the common administration; the Landwehr and Landsturm are under the control of an Austrian and a Hungarian ministry of war. The navy constitutes a department of the common ministry of war. Austria and Hungary have each a representative parliament of two chambers and a responsible ministry. The Austrian parliament is termed the Reichsrat, and the Hungarian the Országgyűlés. The lower house of the Reichsrat consists of 516 members, elected for six years; the lower house of the Országgyűlés, 453 members, elected for five years. Each of the Austrian crownlands has a unicameral diet, and there is also a unicameral diet for Croatia and Slavonia. The administration of Bosnia and the Herzegovina is directed by the common ministry of finance.

The sovereign in 1917 was Charles (Emperor Charles I of Austria and King Charles IV of Hungary), who succeeded his great-uncle, Francis-Joseph, upon the latter's death November 21, 1916. The emperor-king was born August 17, 1887, and on October 21, 1911, married Zita, princess of Bourbon and Parma, who was born May 9, 1892. Heir-apparent, Archduke Francis Joseph Otto, born November 20, 1912.

The common ministry in 1917: premier and minister for foreign affairs: Ottokar (Count) Czernin, appointed December 22, 1918, in succession to Stephan (Baron) Burián von Rajecz, who became minister of finance; minister of war, Field Marshal Rudolf Stöger-Steiner von Steinstätten, appointed April 13, 1917. Premier of the Austrian ministry, Heinrich (Count) Clam-Martinitz, appointed December 3, 1916; premier of the Hungarian ministry, Stephan (Count) Tisza, appointed June 10, 1913.

### HISTORY

**THE AUSTRIAN MINISTRY.** As noted in the preceding YEAR BOOK Count Karl Stürgkh, Austrian premier since 1911, was assassinated by a Socialist editor, Dr. Friedrich Adler, on October 21. His successor, Dr. Ernst von Koerber, after a vain attempt to sustain a ministry, gave way on December 13 to Dr. Alexander Spitzmüller, whose cabinet lasted only a few days, that is, until December 20. It was succeeded by that of Count Clam-Martinitz, a Bohemian nobleman who had been formerly minister of agriculture. The Clam-Martinitz ministry lasted six months, during which period the most important event was the convoking of the Reichsrat on May 31 for the first time since the beginning of the war. In the course of his speech from the throne on that occasion the Emperor referred to the Slav situation, saying that the constitution must be extended and the administrative foundations widened, not only in the Empire but in the component kingdoms and countries, especially in Bohemia. He promised that the rights of parliament and the true spirit of democracy would be respected. There was little prospect, however, of harmony in the Reichsrat and the ministry was in a very doubtful position. The Czechs not having been sufficiently consulted by the ministry were exasperated. The Austrian Germans were angered by the delay in the promised measures for Germanizing Austria. The Social Democrats were offended because the Emperor had not taken the oath to the constitution, and the Poles, angered by his refusal

to incorporate Galicia into the new Poland, voted against the budget. The Czechs were further displeased because the prime minister had not taken a Czech into the ministry, but had taken a German instead. Then the trial, for high treason, of the Czech deputy, Kiofac, caused discontent. In the first place, he was a chairman of the Czech Union and in the second place the military tribunal by which he was being tried was not regarded as competent either by the Czechs or by some of the other parties.

The political situation in the summer was very confusing. Rumors were circulated and promptly denied—it was reported for instance that Czech regiments had deserted to Russia—and it was impossible to secure exact information on account of the censorship, but signs that the Dual Monarchy was disintegrating caused alarm among the Germans. Clam-Martinitz had tried to steer a middle course. He would not uphold the absolutism of his predecessor or give way to the demands of the Austrian Pan-Germans for a *coup d'état* and the enforcement of German as the sole official language. On the other hand he did not follow the course desired by the Slavs. He said, "My programme is Austria," meaning thereby that it was the duty of a subject to regard himself as an Austrian rather than a German, or a Czech, etc., but this seemed an unattainable ideal. The Czechs regarded the ministry as entirely hostile to them, and they came to an understanding with the Jugoslavs and Ruthenians for the promotion of their respective national aims. The revelations of political and military oppression during the war caused much distrust, and though the budget passed without opposition, the Reichsrat showed itself refractory whenever any question involving nationality came up for discussion. Both Czechs and Jugoslavs claimed national independence and unity and demanded the abolition of the dual system. When the Poles also joined the opposition, the cabinet could stand no longer. The premier at first rejected the plan of the Slavs for a division of the Empire on a racial basis; then he tried to placate the Slavs by offering to create seven new cabinet offices to be filled by non-Germans; and finally he put forth a plan, the details of which were not published, for the division of Austria into four parts. These efforts failing he presented his resignation on June 18, and after an unsuccessful attempt at the Emperor's wish to reconstruct a ministry he resigned definitely on June 23. The Emperor, who appeared extremely reluctant to let him go, wrote him afterwards a letter which was extraordinarily profuse in his praises. Thereupon a new ministry was formed under Dr. Ritter von Seidler, but it was announced at the time that it was to be only of a provisional character. On June 28, the Reichsrat voted for the prolongation of its official life until December, 1918.

**SLAV OPPOSITION.** Hoping to come to an understanding with the Czechs the Emperor proclaimed a political amnesty on June 30. This angered the Austrian Germans, who preferred to unite with the Germans of the German Empire rather than yield any further political power to the Slavs; and it also offended the chauvinistic element among the Magyars. Nor did it have the effect of placating the Czechs in the Reichsrat. The new premier, Dr. Ritter von Seidler, and his ministers had taken

no part in politics and were little known. The Czechs renewed their opposition and one of their leaders said they would not support any government unless it abolished dualism and turned the monarchy into a federal state composed of independent national divisions. They continued firm in the demand which they had formally put forth on May 30 that all Czechs and Slovaks should be united in an independent, democratic Bohemian state. Overtures of the German element in parliament to the Czech leaders were repulsed early in July. They refused to coöperate with the German deputies in any plan for constitutional revision and urged a policy of "passive resistance" against Austria, on the ground that the Czech problem was an international one and could only be decided at the peace conference after the war. If they allowed themselves to be drawn into a coalition ministry it would, they said, compromise their ultimate independence. Poles, Ruthenians, and Jugoslavs were also aiming at ultimate independence and re-union with their kinsmen outside Austria. Constitutional revision was therefore blocked. Dr. Seidler now attempted to form a permanent parliamentary cabinet, to replace the present one which from the first he had declared to be only provisional. The offer of two seats in such a cabinet was made in July to the Bohemian Club but was rejected. The Polish Club on August 6 declared that no Pole would enter such a cabinet and renewed their demand, definitely put forth on May 16, for a united, independent Poland, with access to the sea. The Jugoslav Club on August 7 passed a similar resolution. It declared that all Southern Slavs stood solidly with the Czechs and like them rejected any plan of self-government that should be limited to the existing provincial boundaries. They said the absolutism practiced in Bosnia-Herzegovina and the oppression of the Jugoslavs in Austria made agreement with the present government impossible. Of the Germans only the Nationalist party favored the plan for a parliamentary cabinet, while Social Democrats, and Christian Socialists opposed it. Thus there seemed small chance of success for it, and the only alternative was to form a permanent ministry of the bureaucratic type.

In June the national council of Czech communities issued a formal protest which in substance was as follows:—More than fifty Deputies, it said, were unable to discharge their duties, for the greater part of them had been placed under arrest. The government had brought on the war without the consent of the Czech deputies and the Czech nation; it had caused the shooting of Czech soldiers in masses; had interned hundreds of their compatriots; condemned their Deputies to death or imprisoned them; gagged or suppressed the press; spent more than sixty billions on this criminal war; and involved the Czech communities in ruin. Now it refused to let the eight imprisoned and exiled Deputies return to parliament. It had brought action against the leader of the radical Czechs only two days before the meeting of parliament, although he had been in confinement since the beginning of the war. It was preparing new trials against other Czech patriots. The calling of parliament was merely a sly trick in favor of the Central Powers, the government hoping to deceive the Allies and bring them to

peace. The protest concluded with an emphatic condemnation of the intrigues and aggressions of the government and declared the determination of the Czechs to secure liberty and complete independence.

The national ideal was equally active in Poland and Galicia and the Jugoslavs also were discontented and were demanding that the promises of the central government should be fulfilled. In parliament out of the 481 deputies there were 232 Slavs who with the Socialists placed the government in a minority. They characterized the policy of Czernin as the maintenance of the old order under the appearance of modern democratic institutions, in order to deceive the Allies.

**CHARGES OF THE JUGOSLAVS.** In a speech delivered in the Austrian parliament on October 19 by a Croatian Deputy, the Austrian government was accused of the most terrible cruelties towards the Jugoslavs, ever since the outbreak of the war. The Deputy said that upon his trial the judge informed him he did not know what the accusation against him was and that this was natural because the authorities had arrested in Dalmatia, Istria, and Carniola alone more than 5000 persons. In transporting the prisoners they were exposed to every sort of hardship as well as to the blows of the Magyar soldiers. Many of them lost their reason on the journey. He implied that many more were arrested in Bosnia, Herzegovina, Slavonia and in the south of Hungary. Among them were professional men, journalists, and other persons of education. He gave a long array of details of death by starvation, cruelty, and murder. Little notice was taken of these charges in the German and Magyar press and a portion of his speech was suppressed. To what extent it was founded could not be ascertained, but its effect in rousing the Slavs everywhere was very great.

**THE POLISH PROBLEM AND COUNT CZERNIN.** The Austro-Hungarian foreign minister, Count Czernin, visited Berlin on November 5 to attend a crown council assembled by the Kaiser. It was generally understood that the chief topic for discussion was the Polish question and that the plan favored by the authorities comprised the following features:—The proclamation of the Emperor Charles as the king of Poland; the cession of Galicia by Austria to Poland, which was then to form a new state within the monarchy on the same footing as Austria-Hungary, and that in like manner Germany should take over Lithuania and Courland, granting them local self-government. There was much excitement in Germany and Austria over this scheme and in Austria there was especial concern on account of its effect upon the aims of the other Slav communities for national unity.

Also it would have an important bearing upon the destiny of the Ukrainian or Ruthenian population of East Galicia. On November 9 an important debate on the subject took place in the Austrian parliament. The Ukrainians protested against the enslavement of three and one-half million of their people, the southern Slavs expressed alarm at the solution of the Polish question without relation to the Jugoslav, Bohemian and Ukrainian questions, since by leaving these out they would place the Slavs in minority in parliament; the Czechs condemned the plan as a violation of democracy and constitutional principles. The Ukrainian socialists opposed it

on account of their desire to form a united independent national state out of parts of Austria-Hungary and the Ukraine. The German Socialists said it would make real democracy impossible and would leave Austria without the power of determining her own needs. The spokesman of the Yugoslavs said the plan, if carried out, would place the Ukrainians in minority in the kingdom of Poland and the southern Slavs in a minority in the rest of the Empire. The southern Slavs said they must be free not only in Austria but also in Hungary and the dual system must be abolished. Many other speeches followed to the same effect denouncing the dual system and demanding the freedom of the nationalities. The prime minister declared that it was not possible at present to solve the Polish question, but if in future the new kingdom of Poland should wish to enter into closer relations with the monarchy the representatives of the Austrian people would have an opportunity to express themselves. He declared that the Polish question did not stand in the way of peace, however it might be solved, and he gave the assurance that the Polish state should have a free choice in its political settlement.

**JUGOSLAV PROGRAMME.** According to a statement of Dr. Korosec, Slovene leader in the Reichsrat, on October 11, the Yugoslav aims were: Creation of an independent Slav state comprising not only all parts of Austria inhabited by southern Slavs, but also Slavonia and Croatia. They agreed with the Hungarian Premier, Dr. Wekerle, that Dalmatia belonged to Croatia-Slavonia, but held that with that region it should be incorporated in the new Yugoslav state. Toward Hungary they believed in following a friendly policy which should include coöperation with the Hungarian unified state in the political and economic tasks of the future. Toward Austria they were in a position of absolute opposition. They would refuse to support the budget or to take part in any active policy.

**THE CZECHO-SLOVAK MOVEMENT.** The Czechs and Slovaks—as represented by their political leaders in Bohemia, Silesia, and Moravia—aimed at an independent Czech republic. This policy was agreed upon. They wished the future peace congress to sanction this purpose and they refused absolutely to take any part in the constitutional reform of Austria in the direction of national independence because they believed it would compromise their policy in the long run. Since the beginning of the war they had claimed their complete independence and they relied upon the promises of the Entente Allies that the small nations should have a right to dispose of themselves. Their leaders argued that they had, at enormous cost of life and property, assumed the attitude toward Austria-Hungary of rebels and that if the Allies obliged them to remain under the Austrian and Hungarian yokes it would be a betrayal. The only condition, they said, under which they would accept independence for a Czecho-Slovak state inside Austria-Hungary was the transformation of the Empire into a federal republic. In this respect they were like the Yugoslavs, who also were unwilling to form a part of the Austro-Hungarian monarchy. The German element in the Empire saw in this the prospect of another war which should follow the present one, that is to say, an internal war on the part of the Slavs, not

only for the dissolution of Austria, but also for the dismemberment of Hungary. Toward the end of the year the debates on this subject in the Hungarian and Austrian parliaments were exceedingly bitter. Among the Entente Allies there was not only a natural sympathy with these aspirations for independence, but in certain quarters it was argued that if realized they would thwart the German project of a middle Europe and check the drive of Germany toward the West. A prominent representative of the Slavic movement for independence said that if Poland were re-constituted, Bohemia made independent, and the Yugoslavs united, an insurmountable barrier would be raised across the pathway of Germany to Bagdad.

**HUNGARY: FALL OF THE TISZA MINISTRY.** There were frequent reports early in the year of disturbed conditions in Hungary. In April it was said that the Hungarians at a secret council at Easter had adopted a resolution in favor of following the example of the Russian revolutionists. In a stormy session of the Hungarian Chamber Count Batthyani denounced Count Tisza as a blood maniac and said that the only way to end the war was to dismiss him. The opposition to Count Tisza on grounds of domestic policies, that is to say, for his refusal to introduce suffrage and other reforms in Parliament solidified in April and a strong element led by Count Andrássy, Count Apponyi, and Michael Karolyi declared finally that they would have nothing to do with the Tisza government. The government still continued in power and on April 29 it forbade a meeting in front of the parliament building for the purpose of discussing voting reform. Count Tisza delivered a speech to the workmen's party saying that neither voting reforms nor the prolongation of parliament which the opposition was demanding was necessary. For a time there was an effort to form a coalition government, but this failed, and the opposition now endeavored to overthrow Count Tisza and form a cabinet under Andrássy. Finally, on May 23, Count Tisza resigned, the reasons assigned being the differences with the throne over franchise reform measures. It was said that Tisza did not wish to go so far in that direction as the Emperor desired. On May 29 Count Julius Andrássy, former prime minister and for a long time one of the leading opponents of the Tisza ministry, became Prime Minister. He was described as a Liberal of the advanced type. Early in the war he, with Count Apponyi and others, had agreed not to antagonize the government's foreign policy but after August, 1916, they broke with the government, especially on account of differences in regard to domestic affairs.

The fall of the Cabinet came as a surprise in spite of the fact that on many previous occasions the crisis was said to be approaching.

Count Tisza had been regarded as one of the chief authors of the war. His government was extremely unpopular with the progressive element. Much disappointment and distrust were occasioned by the promises of reform which were never fulfilled. Instead of universal suffrage, which was demanded by the entire people, the government merely announced that it would permit non-commissioned officers and soldiers who returned from the war with military decorations to enjoy the right of voting. There was even criticism of the Hungarian government on the

part of certain elements in Austria. The newspapers in Vienna, for example, characterized Hungary as the most backward country of Europe. During the month that preceded the fall of the cabinet the Austro-Hungarian government, as well as the German government, had promised all sorts of reforms in the direction of democracy. In Austria-Hungary the government developed a programme that seemed to offer concession to the Slavs. The Slavs in general, however, were very distrustful of this policy, regarding it as an attempt to deceive. They argued that the German element in the empire would never recognize their privileges. In Hungary the privileged classes opposed even more bitterly all popular and national claims and Count Tisza and his ministers were perfect representatives of this reactionary class.

Political observers among the Entente Allies, however, did not anticipate much improvement as a result of the fall of the cabinet and above all they discouraged any confidence that Austria-Hungary would make a separate peace.

A well-known writer for the Press declared: "Among the mistakes of the present hour there is none more serious than the belief in the possibility of the offer of a separate peace by Austria. Austria provoked the war and she cannot reject her responsibility without being guilty of treason. Moreover, Austrian and German troops are so intermingled that a separation of them would be impossible. An attempt at a separate peace would be regarded by the people merely as an expedient to save the throne."

**OTHER EVENTS.** In her war policy Austria-Hungary continued to cooperate cordially with her imperial ally. On January 5 the Emperor addressed the troops on the subject of the peace policy of the Central Powers and on January 12 despatched a new note on that subject to the neutral governments. On January 26 the agreement between Austria and Hungary, known as the *Aus-gleich*, was renewed for the period of twenty years. The changes that were made in it were all in favor of Hungary, whose share in the common expenses was reduced from 36 per cent to 34 per cent. It also provided that export duties should be modified to the advantage of the Hungarian agricultural interests, and that Hungary's securities should be admitted to the Vienna stock exchange.

On January 4, the Emperor commuted the death sentence of four prominent Czechs charged with treason to various terms of imprisonment. Dr. Kramarz, charged with trying to aid Russia, was sentenced to fifteen years in prison. The general amnesty proclaimed on the King's coronation applied only to Hungary. Another important trial was that of Dr. Friedrich Adler, who, as noted above, had assassinated Count von Stürgkh, the Austrian Prime Minister, on October 21, 1916. On May 19 he was sentenced to death. In the course of a plea on his own behalf he declared that he had been driven to the act by the government's violation of constitutional rights in suppressing trial by jury and refusing to summon parliament.

On April 4, the resignation of the three Austrian Ministers of Justice, War, and Finance was announced on account of a scandal pertaining to army supplies furnished by a former director of the Vienna Deposit Bank. They were said to have aided him in escaping after he had

made illegal sales of foodstuffs to the army at exorbitant prices. The Emperor refused to accept the resignation of the Minister of Justice, von Schenck, but in April accepted the resignation of General von Krobatin, the minister of war, who was succeeded by General von Steinmettin. On April 18, two more ministers resigned, Dr. Urban, minister of commerce, and Dr. Baernwerther, minister without portfolio.

See FINANCIAL REVIEW; NAVAL PROGRESS; WAR OF THE NATIONS.

**AUTHORS' LEAGUE OF AMERICA.** The League is a business association of authors and others identified with the production of books, and of persons in artistic work. Its special purpose is the guarding in every way of the interests of all who are engaged in the creation of copyrightable material and to work towards the improvement and standardization of the conditions under which such material is sold, leased, or otherwise made accessible to the public. Writers, whether of novels, poems, essays, stories, or educational books, also writers of dramas and photo-plays, painters, illustrators, composers, sculptors, and photographers may become regular members. Publishers, theatrical managers, literary, and dramatic agents are among its associate members. Through its claim, general business, confidential information, copyright, registration, forwarding, accounting, bulletin, employment, and other bureaus, the League is able to advance the interests of its members in various ways, especially by its advice concerning contracts, in the collection of accounts, and by assistance in securing copyrights. In addition to its work as a business association, the League has frequent meetings of a social character.

The officers for 1917-18 are: President, Rex Beach; vice-president, Theodore Roosevelt; secretary and treasurer, Eric Schuler; counsel, B. H. Stern; consulting accountant, Richard T. Lingley.

**AUTOMATIC RIFLE.** See MILITARY PROGRESS.

**AUTOMOBILES.** In the design of the 1918 cars, passenger as well as commercial or military, developed during the year 1917, the influence of war conditions was distinctly seen, both in the attempts to secure greater simplicity and standardization, and in efforts to adapt the motors to consuming a lower grade of fuel in the interests of economy. This last consideration, of course, resulted in considerable attention being paid to the carburetor and some of the devices employed were an electric coil to raise the temperature so as to enable the fuel to vaporize more readily or a somewhat complicated stove arrangement heated by the exhaust from the engine. In the passenger cars themselves, deeper and lighter frames were being employed without any sacrifice of strength. With this tendency to lightness in body construction many believed that future developments of pleasure cars would show still greater improvement in the design and construction of the bodies.

In the 1918 cars apparently the limit has been reached in the size of wheels, as with the better roads further efforts in this construction were not desirable. The stream lines which had been developed in part for speed, continued to figure, but rather on the score of economy. For later cars the one-man top had become practically universal, and with it was seen the in-

clined windshield, this also serving to reduce the air resistance. For a like purpose care was being expended on the front mud guards and by properly fashioning them, a saving was made here also. The self-starter having become a necessity rather than a luxury was receiving attention, as it too figured to an increased degree in economy as it prevented the waste due to the further operation of the engine when the car was at rest. These and other developments made during the year were of interest, inasmuch as purchasers as well as designers were becoming impressed with the need of considering economies, particularly if the price of fuel continued to rise or if there were government restrictions imposed on its use in the course of the war. Economy of maintenance, greater endurance, and reliability were the points sought after by discriminating purchasers and were being met by manufacturers not in innovations but in selection of materials, better workmanship, and improvement of details.

**GAS DRIVEN MOTOR VEHICLES.** One of the developments of the year in Great Britain was the use of gas in motor vehicles as a substitute for gasoline. Messrs. Barton Brothers of Beeston successfully worked out a system which employed a flexible balloon-like gas-holder ranging in size from 150 to 500 cubic feet capacity, carried on the roof of the vehicle. A very low pressure was used for the gas stored and consequently there was available fuel for but a short run. An advantage, however, was that the gas-holder could be replenished at almost any point, and that it was cheap and of light weight. On the Continent of Europe, compressed gas under a maximum pressure of 120 atmospheres, and even up to 200 atmospheres had been employed, but the difficulty of securing the steel or iron cylinders for such holders prevented extensive experiment in Great Britain with the higher pressures. A joint committee of the Commercial Motor Users' Association, the British Commercial Gas Association, and the National Gas Council was appointed to further the use of gas as a fuel for motor traction, and late in the year the Automobile Association Executive Committee decided to offer a prize of £1000 for the best invention which would enable coal gas to be used with advantage as a propellant of motor cars and motor-cycles.

**UNIFLOW ENGINES FOR ROAD VEHICLES.** The extensive use of the uniflow engine naturally led to its consideration as a source of power for road vehicles. Such an engine with tripleported admission valves and auxiliary exhaust valves which caused the points of compression to occur late in the stroke instead of at the point where the piston covers the main exhaust ports as is customary with uniflow engines, was fitted to a traction engine and was tested in the Mechanical Engineering Department of the Ohio State University. A paper by F. W. Marquis before the American Society of Mechanical Engineers in 1917 described this test, which demonstrated that with saturated steam and working non-condensing, the engine had a lower steam consumption than an ordinary compound engine similarly working, while when working non-condensing, it had approximately the same consumption as a compound counter-flow engine working condensing on the saturated steam. These experiments were typical of the interest in various forms of increased economy for engines

for road vehicles due to the rising cost of the lighter petroleum fuels.

**A KEROSENE GASIFIER.** An invention which it was thought might possibly solve the motor fuel problem was a kerosene gasifier or vaporizer which could be fitted to any car, making possible the use of kerosene for fuel, as well as gasoline, without any changes in carburetor, spark plugs, etc. The new gasifier was installed between the carburetor and the intake manifold, taking kerosene from the former and vaporizing it before its entrance into the cylinders. The vaporization was accomplished by arranging the exhaust pipes to pass around the gasifier, thus heating the kerosene and transforming it to a gas. In thus using kerosene, it was necessary to start the motor by using gasoline which was stored in a small additional tank, the regular tank holding the kerosene. Once the gasifier had become hot the kerosene was picked up automatically and the motor run on the gasified kerosene. A single gallon of gasoline was sufficient for about 200 starts, and in the test of a stock touring car fitted with a gasifier, 21.5 miles were made on a gallon of kerosene as compared with 15.21 miles on a gallon of gasoline.

**MUFFLER CUT-OUT.** The National Automobile Chamber of Commerce decided during the year to give up the fitting of muffler cut-outs to cars on the ground that little additional power was developed by this use, as with a properly designed muffler the loss was unappreciable. Furthermore, the noise of the muffler cut-out was decidedly objectionable.

**THE STANDARD ARMY TRUCKS.** An important event in automobile engineering was the development of the new standard army trucks which were especially designed for the Quartermaster Corps by representatives of the Society of Automotive Engineers with the assistance of many manufacturers, whose engineering and production departments contributed many trade secrets. Early in August a conference of about 50 truck specialists and engineers was held in Washington, and by September the design of the new standard truck was completed and work on the parts was immediately put under way. The class A model was to have a nominal carrying capacity under the ordinary Federal ruling of  $1\frac{1}{2}$  tons, while the class B truck was to have a nominal capacity of 3 tons and an actual capacity of 5 tons. Both trucks were to have a two-wheel drive with a speed of 14 miles per hour for the class A, and 12 miles per hour for class B. With the exception of slight differences in cylinder bore, pistons, piston parts and rigging, the aim was to secure the greatest possible interchangeability in the parts and the entire manufacture was standardized in accordance with the best practice for American motor car works.

During October, the first of the five-ton motor trucks was sent to Washington from a factory in New York State where it was assembled, and on its road journey as well as in subsequent tests it met all expectations. In this truck the wheel base was 160 inches and the four cylinders of the engine were  $4\frac{1}{4}$  by 6 inches with 424 cubic inches piston displacement. The transmission was a four-speed, amidships clutch, dry disk enclosed; there was a worm drive and rear axle of full floating type. There was a fuel feed by gravity from a 15-gallon tank on the dashboard with a 16-gallon reserve tank under the seat.

There was double ignition with battery and magneto systems entirely separate.

The three points of advantage claimed for the new design were the best possible lubrication, a water jacket reaching every hot point, and rigidity without undue weight. There was an entirely enclosed governor. The cylinders were cast in pairs with detachable heads, and the spark plugs were placed in pairs side by side in the centre of the cylinder. There was complete pressure lubrication, while the airpump was in a separate assembly with its shaft coupled with the drive shaft. The early tests of the first two Liberty trucks that were to be assembled exceeded the expectations of the Quartermaster's Department of the United States Army and also of the engineers and draftsmen who worked on the design. The engine showed 58 hp. at 1350 r.p.m., and the engine torque curve was better than anticipated. In addition to its military use it was stated that the United States heavy-duty war truck would play a large part in affecting truck design in commercial circles.

**A ONE-TON FORD TRUCK.** One of the developments of the year was the commercial production of one-ton trucks by the Ford Motor Company. These machines involved a heavier chassis than in the familiar pleasure car model and a wheel base of 123 inches with rear wheels 32 x 3 inches solid tire. The rear axle was modified for worm drive, while the propulsion stresses were taken care of by radius rods with pivot connections at the outer ends of the rear axles. Heavier springs of the familiar transverse type were employed at the rear. The engine, hood, planetary-gear system, clutch, front axle, front wheels, steering gear, and lighting system were the same as the pleasure car of the familiar model T. The sale price of this truck was announced as \$600.

**MOTOR DRIVEN VEHICLES FOR STREET CLEANING.** In the annual report by J. F. Fetherston, the New York City Department of Street Cleaning for the year 1916, published in 1917, reference was made to the extensive use of motor vehicles to displace the horse-drawn vehicles, and hand cleaning. In a model district in the city of New York, a thorough test was made of tractors and trailers as well as of motor driven flusher-sweepers. The trailers were designed to collect in separate containers, ashes, street sweepings, garbage, and rubbish, and these containers could be removed easily and discharged into a scow by tackle and derrick boom. The combination flusher-sweepers also proved effective, and it was estimated that \$68,000 was saved to the city by the more modern equipment in 1916 as compared with 1914 when horses were used exclusively.

**MOTOR TRUCK TRANSPORTATION.** Truck transportation in all the civilized countries attracted much greater interest in 1917 than ever before. One of the developments in England was to provide loads for empty trucks on their return from delivery of their original cargo. In certain of the districts such work proved remarkably effective and released the corresponding amount of much needed rail facilities. In the United States large capacity motor trucks were being used by manufacturers and others to deliver raw materials and finished products, especially where the haul was not too long and the roads were adequate and well maintained. In some in-

stances manufacturers were employing motor trucks to haul coal to relieve the railway congestion, while in other cases, especially between Philadelphia and New York, it was found that a 12-hour motor truck service could be maintained at a cost not in excess of railway express rates. In a number of cases where factories were maintained within 50 miles from great cities, such as New York and Boston, a regular service was organized and a daily schedule maintained.

In December, 1917, the United States Post Office Department called for sealed proposals for bids on a motor mail route between New York and Hartford, the cars going by way of Waterbury, Danbury, and White Plains, a distance of 105 miles and maintaining a scheduled time between the two terminals. It was proposed to leave Hartford at 5.30 in the morning and reach New York at 3.30 in the afternoon of the same day, and also maintain corresponding hours in the opposite direction. In addition to carrying mail bags, the drivers would sell stamps and receive and deliver registered matter along the route. The Post Office Department contemplated the establishment of a large number of parcel post motor routes in various parts of the United States and was to ask Congress in 1918 for the necessary authority.

In April, 1917, a regular service of automobile trucks, described as "highway freight trains," was established by the Goodyear Tire and Rubber Company, to operate over country roads from Akron, Ohio, to Boston, covering 1510 miles in a week. It was called the "Akron and Boston Express," and the equipment consisted of two White and two Packard trucks, of 1½, 3, and 5 ton capacity, which later was to be increased. A regular schedule was maintained, calling for the round trip (1510 miles) in less than one week, and the cars usually were on time. The new service was able to compete as regards time and costs with the ordinary express companies. Tires were carried on the eastward trip and cotton fabrics and machinery on the return trip, while several trips were made to Washington, D. C., with "war orders."

The only serious difficulty in ordinary weather was 28 miles of unimproved road on the route, where mud caused trouble. Another handicap was the poor condition of some of the old wooden and steel bridges. The trucks use pneumatic tires exclusively.

In the construction of the various cantonments and other military camps, motor trucks played an extensive part, and in many cases they were furnished by the Quartermaster's Department to expedite the construction. Often these trucks enabled lumber and other supplies to be carried a considerable distance before the railway sidings were completed up to the camps, and they afforded a unique test of their capabilities under rough conditions. At Camp Custer, near Battle Creek, Mich., where two companies with from 30 to 40 trucks, each, were furnished by the Quartermaster's Department, U. S. A., one company was equipped with 3-ton trucks and the other with 1½-ton trucks. The soil was sandy and both the main and temporary roadways were soon cut into deep ruts, and it was found that the lighter trucks were so much more serviceable that the 3-ton trucks were eventually shipped away to other fields of service.

On December 16 a train of 30 Packard army trucks left Detroit for the Atlantic seaboard, a journey of 600 miles by road in order to test the feasibility of overland transportation, and also to save the freight cars required, as but two of the trucks could be shipped in a 40-ton freight car. Considerable snow was encountered on the trip, and the motor train received a severe test, as the roads left much to be desired. Steady progress was made and the seaboard eventually reached and it was determined to give to other trucks a similar test in order to train their drivers and the transportation troops, as well as actually to transport needed materials.

**STATISTICS OF 1917.** The annual statistics compiled by the National Automobile Chamber of Commerce for the year 1917 revealed a continued and extraordinary development in the use and manufacture of motor vehicles. In 1917, there were registered in the United States 4,842,139 motor vehicles, of which New York State claimed 418,000. The number of motor trucks in use in the United States was approximately 435,000. On January 1, 1917, there were in use in all countries outside of the United States 719,246 motor vehicles, of which there were in Europe, 437,558; in Canada, 118,086; in South America, 39,188; and in Eastern Asia, Australia, and Oceania, 55,340. In 1917, there were 550 motor vehicles manufacturers in the United States, in 32 different States, having an invested capital of \$736,000,000 and employing approximately 280,000 workers. Commercial vehicles were manufactured by 372 firms or corporations and passenger vehicles by 238 factories. In the fiscal year ending June 30, 1917, 1,806,194 motor vehicles were produced in the United States, of which 1,693,994 were passenger vehicles, and 112,200 were commercial cars. The wholesale value of these vehicles was stated at \$917,470,938. In the calendar year 1917, there were produced 1,795,840 passenger cars and 181,348 commercial cars. The average price of the passenger car of 1917 was \$720. The value of automobiles, trucks, engines, tires, and parts exported from the United States in the fiscal year ending June 30, 1917, was \$133,411,217, which was made up in part of 64,834 passenger cars valued at \$48,620,928, and 15,977 commercial cars valued at \$42,337,315. The remaining items consisted of automobile engines, tires, and other parts valued at \$42,452,974. In addition to the manufacture of motor vehicles, the making of bodies, parts, and various accessories and articles used in the automobile trade, involved 6789 manufacturers, of which 1080 were body, parts, and accessories makers with a capital of \$336,000,000, employing 320,000 workers. In the fiscal year ending June 30, 1917, 18,000,000 automobile tires valued at \$450,000,000 were manufactured in the United States. On the commercial and maintenance sides, as well as in manufacturing motor vehicles, there figured a large number of dealers, garages, repair shops, etc., which were conservatively estimated at 46,000, the dealers alone aggregating 27,000, the garages 25,500, and the repair shops 13,500. Tire vulcanizers numbered 12,000, automobile supply houses, 2550, and jobbers in automobile supplies, 282. The invested capital of dealers, garages, etc., was estimated at \$184,000,000.

Two of the leading statistical considerations of the year were the provision of transporta-

tion facilities by motor vehicles and trucks to relieve the railways of short haul, freight, and passenger traffic, and the great registration of automobiles in agricultural States of the west and south. Furthermore, a consideration was the replacement of horses by motor trucks and thus releasing for the production of human foods some 10,000,000 acres of land that would be required to sustain horses. An estimate of the tons of goods hauled yearly by motor trucks was 1,200,000,000, and the cost of haulage was estimated at 18 cents per ton mile as compared with 24 cents per ton mile by horse and wagon.

The statement was made that in the United States, there were 24 persons to every one motor car, and in eleven Middle West States, there were 17 persons, while in eleven Eastern States, there were 26 persons. In 1917, it was estimated that 40 per cent of the cars were sold to farmers, and to each mile of public road there was 1.72 cars, and to each mile of surface road 14.77. The number of automobiles in the United States for each square mile was 1.4.

**SPEED RECORD.** A speed record for a motor car was made on the Sheepshead Bay track by an aluminum racing car, which completed 100 miles in 54 min., 20.98 sec., or an average speed of 110.4 miles per hour. The engine gave 135 horsepower and weighed only 490 lb. or about 3½ lb. per horsepower.

**RACING EVENTS.** Practically all the principal automobile racing fixtures were cancelled during 1917 because of the war. Ralph De Palma contributed the most noteworthy performance of the year by establishing a new world record for six consecutive hours at the Sheepshead Bay Speedway. He drove a Packard car, equipped with a Liberty Motor, 633.12 miles at an average of 105.6 miles an hour. In the first hour De Palma covered 112.96 miles, as against the old record of 107.9 miles established by Dario Resta, Eugene Chassagne, and Lee Guinness, driving alternately, at the Brooklands Track, England, on October 1, 1912. De Palma also was the victor in the triangular race held at Sheepshead Bay, his opponents being Barney Oldfield and Louis Chevrolet.

Two new competitive speedway records, regardless of class, were made by Ralph Mulford at Chicago. He drove a Hudson Special 150 miles in 1 hour, 26 minutes, 14.9 seconds and 200 miles in 1 hour, 55 minutes, 11.05 seconds.

**AVIATION.** See AERONAUTICS.

**AVIATION FIELDS, AMERICAN.** The United States Army Signal Corps maintained during 1917 the following signal corps aviation fields, all of which were being equipped as training or supply camps, and were named for officers who had lost their lives in the flying service, or for famous aeronautical engineers:

**CALL FIELD,** Wichita Falls, Texas, named for Lieutenant Loren H. Call, C. A. C., killed July 8, 1913.

**CHANDLER FIELD,** Essington, Pa., named for Lieut. Rex Chandler, C. A. C., killed April 8, 1913.

**CHANUTE FIELD,** Rantoul, Ill., named for Octave Chanute, the pioneer aeronautical engineer, who died a natural death in 1911.

**ELLINGTON FIELD,** Houston, Texas, named for Lieut. E. L. Ellington, killed November 24, 1913.

**GERSTNER FIELD,** Lake Charles, La., named for 2nd Lieut. Frederick J. Gerstner, 10th Cavalry, who was drowned December 21, 1914.

**HAZELHURST FIELD,** Mineola, L. I., named for Lieut. L. W. Hazelhurst, Jr., killed June 11, 1912.

**KELLY FIELD,** San Antonio, Texas, named for 2nd Lieut. G. E. M. Kelly, 30th Infantry, killed May 10, 1911.

**LANGLEY FIELD,** near Old Point Comfort, Va.,

named for Professor Samuel P. Langley, who died a natural death in 1916.

**LOVE FIELD**, Dallas, Texas, named for Lieutenant Moss L. Love, 11th Cavalry, killed Sept. 4, 1913.

**PARK FIELD**, Memphis (Millington), Tenn., named for Lieut. Joseph D. Park, 14th Cavalry, killed May 9, 1912.

**POST FIELD**, Fort Sill, Okla., named for Lieut. Henry R. Post, 25th Infantry, killed Feb. 9, 1914.

**RICH FIELD**, Waco, Texas, named for Lieut. Perry C. Rich, Phil. Scouts, killed Nov. 13, 1913.

**ROCKWELL FIELD**, San Diego, Cal., named for Lieut. Lewis Rockwell, 10th Infantry, killed Sept. 28, 1912.

**SELFRIDGE FIELD**, Mt. Clemens, Mich., named for Lieut. Thomas Selfridge, F. A., killed Sept. 17, 1908.

**CAMP TALLIAFERRO**, Fort Worth, Texas, named for Lieut. Walter R. Talliaferro, killed Oct. 11, 1915.

**SCOTT FIELD**, Belleville, Ill., named for Corporal Scott, killed Sept. 28, 1917.

**WILBUR WRIGHT FIELD**, Dayton, Ohio, named for Wilbur Wright, who died May, 1912.

**BACTERIA.** SEE BOTANY.

**BADEN.** A European grand duchy, one of the more important constituent states of the German Empire. The capital is Karlsruhe. Baden is bounded by Bavaria on the east and is separated by the Rhine River from the Palatinate and Alsace on the west and from Switzerland on the south. The area is 5819 square miles, which is somewhat smaller than the land area of Connecticut and Rhode Island. The population at the census of December 1, 1910, was 2,142,833, as compared with 1,867,944 in 1900, 1,657,867 in 1890, 1,432,000 in 1864, and 1,006,000 in 1816. The average annual increase from 1816 to 1910 was 0.80 per cent; from 1900 to 1910, 1.37 per cent. In 1910, communes having 2000 or more inhabitants aggregated a population of 1,234,087. Roman Catholics numbered 1,271,015 (59.32 per cent); Evangelicals, 826,364 (38.56 per cent); other Christians, 13,229 (0.62 per cent); Jews, 25,896 (1.21 per cent). Baden has a bicameral diet. The lower house consists of seventy-three members, elected by direct vote for four years. The grand duke in 1917 was Friedrich II, who was born July 9, 1857, and succeeded his father, Friedrich I, September 28, 1907.

**BAEYER, ADOLPH VON.** A German chemist, died, August 24, 1917, at Starnberg, Germany. He was born at Berlin in 1835, studied chemistry under Bunsen and Kekulé, and in 1858 graduated at Berlin University as Ph.D. He was privat docent at Berlin until 1866, when he was appointed assistant professor. Appointed professor of chemistry at Strassburg in 1872, he filled that position for three years after which he taught at the University of Munich. In 1881 he won the Davy medal awarded by the Royal Society, London, for his researches on indigo; and in 1905 he gained the Nobel prize for chemistry. His work in organic chemistry gave him very high rank in that branch of science, especially his synthesizing of a remarkably large number of carbon compounds, including new classes of substances, some of which are important not only from a theoretical point of view, but have also been extensively applied in the arts. His works in two volumes were published in Brunswick, Germany, in 1905.

**BAFFIN LAND.** See POLAR RESEARCH.

**BAGOBO.** See ANTHROPOLOGY.

**BAHAMAS.** The Bahamas, the most northern of the British West Indian colonies, are a chain of coral islands lying between 21° 42' and 27° 34' N. lat. and 72° 40' and 79° 5' W. long., composed of about 20 inhabited islands, and an immense number of islets and

rocks. The principal islands are New Providence (containing the capital, Nassau), Abaco, Harbour Island, Eleuthera, Inagua, Cat Island, Ragged Island, Rum Cay, Exuma, Long Island, Long Cay, and the Biminis, Watling's Island, all of which are ports of entry; and Great Bahama, Crooked Island, Acklin Island, Mayaguana, the Berry Islands, and Andros Island (containing the only river). The total area is 4403½ square miles, and the population (estimate) 58,129 in April, 1916 (55,944 in 1911). In the following table revenue and expenditure are for fiscal years:

	1909	1912	1913	1915
Imports . . .	£343,489	£358,111	£403,529	£363,410
Exports * . .	165,116	276,115	263,954	243,431
Revenue . . .	77,578	97,574	100,753	86,251
Expenditure.	92,858	88,077	96,496	90,925
Shipping †	1,304,660	1,247,844	1,747,779	682,264

\* Of colonial produce. † Tonnage entered and cleared.

The public debt on March 31, 1916, was £33,518. The population is mainly negro.

**BALKAN STATES.** The countries comprising the southeastern part of Europe west of the Black and Aegean seas. Parts of this region have frequently been the scene of sanguinary strife between the jealous nationalities. See ALBANIA; BULGARIA; GREECE; MONTENEGRO; RUMANIA; SERBIA; TURKEY; WAR OF THE NATIONS; also DOBRUJA; EPIRUS; MACEDONIA.

**BALLOONS.** See AERONAUTICS.

**BALLOT.** See ELECTORAL REFORM.

**BALTIC PROVINCES.** A term designating the Russian governments of Esthonia, Courland, and Livonia. They border the Baltic Sea and inclose the Gulf of Riga. Area and population as estimated for January 1, 1915: Esthonia, 7818 square miles, 512,500 inhabitants; Courland, 10,535 sq. m., 812,300; Livonia, 18,158 sq. m., 1,778,500; total, 36,511 sq. m., 3,103,300 inhabitants. The principal cities include Riga (see WAR OF THE NATIONS), capital of Livonia, an important commercial seaport, with an estimated population, before the great war, of about 569,000; Revel, capital of Esthonia, a fortified seaport, 137,600; Libau (Libava), seaport, 90,700; Mitau (Mitava), capital of Courland, 46,800; Dorpat (Yurev, Yuriev), university town, 44,100. See COURLAND; ESTHONIA; LIVONIA.

**BANARO.** See ANTHROPOLOGY.

**BANK CLEARINGS.** See FINANCIAL REVIEW.

**BANKS AND BANKING.** While every recent year has seen a remarkable growth in the banking strength of the United States the developments of any previous year were exceeded by those of 1917. This was due fundamentally to the remarkable development of strength and the perfected organization of the Federal Reserve System; but indirectly a considerable effect resulted from the immense increase in the gold holdings of the American banks. By the close of 1917 the deposits of the Federal Reserve Bank, due in part to changes in the law, exceeded those of any other bank in the world. In addition at least one-third of all the greatest banks of the world were to be found in the United States. Below is given some account of the Federal Reserve System and some indication of developments in foreign banks. Ma-

terial of interest in this connection will be found under AGRICULTURAL CREDIT where the establishment of the Federal Farm Loan banking system is described; FINANCIAL REVIEW; NATIONAL BANKS; STATE BANKS; and SAVINGS BANKS.

**FEDERAL RESERVE SYSTEM.** The third year of the operation of the Federal Reserve Banking System was completed November 16, 1917. While the great advantage of this system had been amply demonstrated by the avoidance of panic in the fall of 1914, its great strength and the relative completeness of its organization of the banking and credit facilities of the country were amply demonstrated by the ease with which the first and second liberty loans exceeding more than \$6,000,000,000 were floated.

In a summary of "What the Federal Reserve System Has Done," Mr. H. Parker Willis (the *American Economic Review*, vol. VII) pointed out that it had organized a plan of coöperative banking covering the entire country with a central supervisory agency at Washington; it has to some extent harmonized and unified interest rates, met currency demands readily, eliminated the former difficulties of crop moving periods, and otherwise secured the advantages of centralized banking without some of the latter's defects; and it has made considerable progress toward the pooling of banking resources and the establishment of uniform control over gold reserves. In addition, it has accelerated the standardization of commercial paper, including the bankers' acceptance; has established and carried through to completion a uniform and universal system of check collections; and has stimulated the movement for the introduction of uniform standard methods of business accounting. As yet, however, this system has done little in the development of foreign banking connections and opportunities; it has not developed policies to aid American manufacturers in the retention of foreign trade; nor has it rendered full service in the development in the United States of an international discount market.

Various amendments to the Federal Reserve Act were approved by President Wilson on June 21. In its third annual report in February the Federal Reserve Board had proposed numerous amendments, of which the more important dealt with reserve requirements and note issues. The most important of the eleven new provisions permits each reserve bank to count as part of its gold reserves the gold deposited by it with federal reserve agents against note issues. Previously this gold did not count among the bank's assets so as to be available for credit purposes. Under the new provisions the reserve notes will, it is believed, still be amply protected by at least 100 per cent of commercial paper or gold or both as heretofore, but the reserve banks will be able to pool their gold reserves under the control of the Federal Reserve Board at Washington. It is believed that this gold can thus be more amply protected when necessary and more effectively used when needed. That the new plan will permit a tremendous expansion of credit is shown by the calculation that at least \$1,000,000,000 of new notes can now be issued by the reserve banks in case of a commercial crisis. Moreover, it is anticipated that if the war should terminate suddenly this provision will go far toward pre-

venting a panic; and that, when peace comes, suddenly or otherwise, the unified control of the enormous gold holdings of the system will enable the American banking system to meet the inevitable exportations of gold with less disturbance. The changes in the distribution of reserves may be briefly indicated. Under the original act the central reserve banks were required to hold at least 18 per cent of reserves against demand deposits and 5 per cent against time deposits. The new law reduces these minimum percentages to 13 and 3 respectively with the proviso that the entire reserves may be kept in the Federal Reserve Bank. Under the original act reserve banks were required to hold 15 per cent against demand deposits and 5 per cent against time deposits; the amendment reduces these to 10 per cent and 3 per cent respectively of which all may be deposited in the Federal Reserve Bank. In the original law country banks were required to keep 12 per cent against demand deposits and 5 per cent against time deposits; the amendment reduces these to 7 per cent and 3 per cent respectively, of which all may be deposited with Federal Reserve banks. Thus the more than 7500 individual banks are in a position where they need keep only "till money" on hand, all other reserves being in the reserve institutions.

Another amendment permitted local non-member banks and trust companies, even though too small to be eligible to membership in the System, to utilize the facilities of the reserve banks for clearing and collection, on condition that they cover checks on themselves sent to the reserve banks for collection and keep in addition a compensating balance at the reserve bank. This was designed to universalize the collecting and clearing system and thus increase its serviceability and convenience for the public. Another amendment permits national banks under the approval of the Federal Reserve Board to accept import or export paper up to 100 per cent of their capital and surplus. Another cancelled the requirement that national banks maintain a minimum deposit of government bonds with the United States Treasury. This was designed to alleviate the condition of certain national banks that had retired all their circulation but were still required to have on deposit with the treasurer a certain amount of government bonds. New national banks organized since the passage of the Federal Reserve Act have been free from any such requirement.

**Increased Membership.** As a part of the general plan of consolidating the gold reserves and banking resources of the nation special effort was made to induce state banking institutions to enter the system. Among the amendments adopted on June 21 was one guaranteeing that by taking membership in the System no state bank would sacrifice any charter privileges. This guaranty was strengthened by an opinion of the Attorney-General, September 10, holding that this amendment released state bank members from anti-trust legislation intended to prevent "interlocking directorates." With the opening of the campaign for the second Liberty Loan on October 1, additional pressure was brought to bear on the state institutions. On October 13 President Wilson issued a letter in which he urged "upon the officers and directors of all non-member state banks and trust com-

panies which have the required amount of capital and surplus to make them eligible for membership, to unite with the Federal Reserve System now and thereby contribute their share to the consolidated gold reserves of the country." Numerous state banks and trust companies fell into line. By November 1 enough had joined to bring within the System 70 per cent of the entire banking resources of the country.

**Reserve Bank Statement.** The most notable change in the statement of resources of the Federal Reserve Bank was the enormous increase in the gold holdings due primarily to the amendments above outlined. There was a corresponding increase in the deposits due to members. The consolidated statement of the twelve Federal Reserve banks for December 8 showed a total reserve of \$1,883,307,000. This was an increase of \$994,000,000 over the corresponding week of 1916. All of this reserve except \$51,949,000 of legal tender notes and silver was in the form of gold. This was distributed as follows: gold coin and certificates in vaults, \$500,656,000; gold settlement fund, \$376,776,000; gold with foreign agencies, \$52,500,000; gold with Federal Reserve agents, \$683,939,000; and gold redemption fund, \$17,485,000. The total earning assets of the twelve banks aggregated \$978,120,000, or four times the amount for the same date in 1916. These included: bills discounted for members, \$686,902,000; bills bought in open market, \$190,682,000; and bills slightly over \$100,000,000 of United States and municipal securities. Nearly all of this increase in earning assets was in the item of bills discounted for members. The aggregate resources for the twelve banks were \$3,001,836,000, as compared with \$961,195,000 in December, 1916. The total deposits were \$1,809,265,000, or about treble the amount for 1916. The principal item was the sum due to members on reserve accounts which aggregated \$1,437,174,000. The total amount of Federal Reserve Notes in actual circulation was \$1,110,537,000 or slightly more than four times the amount for 1916.

The gold reserve against net deposit liabilities was 63.1 per cent as compared with 69.8 per cent for 1916. Gold reserve against notes in actual circulation was 63.2 per cent as compared with 103.4 per cent in 1916. Of the twelve banks that of the second (New York) district was far the most important as regards reserves and business. Thus its total gold reserves were \$592,923,000 or 35 per cent of the total for the entire system. Its total resources considerably exceeded \$1,000,000,000, being more than one-third of the total. The second largest bank was that at Chicago, while those at Cleveland and Philadelphia ranked next in size.

**FOREIGN BANKS.** In a general way the changes in the statements of the most important foreign banks were similar to those here. In all but Germany there was a tendency for gold coin and bullion held in vault or abroad to increase. Deposits expanded in all cases much more rapidly than gold holdings; while the most rapid expansion was found in loans and in investments and in note circulation. On August 1, 1914, the Bank of England held \$190,000,000 of gold coin and bullion; on August 1, 1916, \$270,000,000 of gold coin and bullion plus \$142,000,000 of gold held against exchequer

notes; and on August 1, 1917, \$250,000,000 of gold coin and bullion plus \$142,000,000 against exchequer notes. Its loans and investments, August 1, 1914, amounted to \$290,000,000; 1916, \$585,000,000; 1917, \$800,000,000. Deposits for 1914, \$335,000,000; for 1916, \$680,000,000; for 1917, \$865,000,000. Bank note circulation for 1914, \$145,000,000; for 1916, \$183,000,000, and for 1917, \$200,000,000. Exchequer notes to the amount of \$635,000,000 were outstanding on August 1, 1916; one year later their number had been increased by \$170,000,000. These notes partially replaced gold but for the most part were an addition to money in circulation made necessary in part by increased business and higher prices. They were redeemable in gold on presentation at the Bank of England. While other English banks are not required to publish statements a summary of the condition of thirteen principal institutions on June 30, 1917, showed total loans of \$2,335,000,000, an increase in one year of \$420,000,000. Their deposits aggregated \$4,348,000,000, an increase of \$347,000,000 in one year.

The Bank of France held gold coin and bullion in its vaults on August 1, 1914, amounting to \$825,000,000; on the same date in 1916, \$958,000,000; but in 1917 it held \$650,000,000 in vault and \$400,000,000 abroad. Its commercial discounts and advances were \$640,000,000 in 1914; \$618,000,000 in 1916; and \$590,000,000 in 1917. But by August 1, 1916, the bank had advanced to the state for war purposes \$1,600,000,000, and during the subsequent year advanced \$500,000,000 more. In addition the bank held treasury bonds representing advances to foreign governments of \$244,000,000 on August 1, 1916, and of \$550,000,000 on August 1, 1917. Its deposits more than doubled, being \$260,000,000 in 1914 and \$535,000,000 in 1917. At the same time, however, its note circulation trebled, being \$1,355,000,000 on August 1, 1914; \$3,200,000,000 in 1916; and \$4,000,000,000 in 1917. This enormous increase in note circulation was much greater than in either England or Germany but less than in Russia. Bank of France notes have long been the popular currency in that country and this great expansion of the bank's credit reflected the strong place it holds in the confidence of the French people.

Little could be learned of banking conditions in Germany. The statement of the Imperial Bank showed that its gold coin and bullion rose from \$338,000,000 in 1914 to \$615,000,000 in 1916, but fell to \$600,000,000 on August 1, 1917. Its discounts and loans rose from \$200,000,000 in 1914, to \$1,635,000,000 in 1916, and to \$2,780,000,000 in 1917. Deposits amounted on August 1, 1914, to \$235,000,000; in 1916, \$595,000,000; and 1917, \$1,460,000,000. Its bank-note circulation was only \$470,000,000 in August, 1914; two years later it was \$1,755,000,000; and August 1, 1917, \$2,210,000,000. In August, 1914, the bank held treasury notes of only \$21,000,000; two years later it held treasury notes and loan bank notes aggregating \$240,000,000; but on August 1, 1917, such notes amounted to \$1,220,000,000. Thus there was an expansion of liabilities measured in terms of deposits and note circulation from \$705,000,000 in 1914 to \$3,670,000,000 in 1917.

The State Bank of Russia held gold coin and bullion on August 1, 1914, of \$800,000,000 and

gold abroad of \$70,000,000. Two years later its gold in vault was \$775,000,000 while that held abroad aggregated \$980,000,000; and in August, 1917, it held in vault \$645,000,000, and abroad \$1,150,000,000. Its loans in 1914 aggregated \$380,000,000; two years later \$2,440,000,000; and in August, 1917, \$6,620,000,000. This enormous expansion of loans was due almost entirely to loans against short-term obligations of the Public Treasury. These loans amounted to \$5,880,000,000 in August, 1917. In addition, \$150,000,000 represented loans extending on account of merchandising operations of the Treasury. The deposits increased from \$530,000,000 in 1914 to \$980,000,000 in 1916, and to \$1,650,000,000 in 1917. Nearly all of this increase in deposits was credited to the current accounts of persons and institutions. The bank note circulation increased amazingly. In August, 1914, it aggregated \$815,000,000; in

	1914	1916	1917
Bank of England.....	75.3	61.1	61.5
Bank of France.....	71.3	30.4	27.5
State Bank of Russia.....	102.6	22.8	12.7
Bank of Italy.....	56.4	80.7	21.3
German Reichsbank.....	52.5	34.7	31.4
Bank of Netherlands.....	54.8	84.7	82.8
Riksbank, Sweden.....	48.0	...	44.2

Bank of Spain.....	66.5	85.4	93.4
Swiss National Bank.....	46.2	80.5	72.6
Bank of Japan.....	61.1	75.5	94.5

The total liabilities of these twelve foreign banks had trebled, increasing from \$7,233,000,000 in 1914 to \$21,125,000,000 in 1917. Their deposits, however, had increased similarly, or from \$1,864,000,000 in 1914 to \$5,238,000,000 in 1917. The following table shows this expansion of deposits.

	1914	1917
Bank of England.....	Gov. \$61,869,000	\$226,850,000
	other 264,830,000	617,267,000

Total—twelve banks.....	\$1,864,199,000	\$5,237,333,000

August, 1915, \$1,915,000,000; in August, 1916, \$3,438,000,000; and in August, 1917, \$7,060,000,000. There was thus a total increase of resources and liabilities from \$2,690,000,000 in 1914 to \$4,600,000,000 in 1916, and to \$9,480,000,000 in 1917. In addition to the foregoing the Bank held in 1915, \$3,370,000,000 of deposits on trust; these had increased in August, 1917, to \$5,450,000,000.

Some light is thrown upon the condition of credit in Russia by the fact that in August, 1915, 1916, and 1917 the rate of discount on bills up to three months was uniformly 6 per cent; on the same dates the discount rate on bills up to six months was  $6\frac{1}{2}$  per cent; the interest on loans against merchandise was 6 to 7 per cent, while the interest on loans against interest-bearing securities was  $6\frac{1}{2}$  to 7 per cent in 1915 and 1916, and ranged from  $5\frac{1}{2}$  to 7 per cent in 1917.

A large part of the increase of note circulation of the Bank of Russia has been due to the chaotic state of trade which has interfered with the collection of revenues and the orderly flotation of loans and made the Bank a chief reliance in supporting the operations of government.

Among the notable effects of the war on foreign banking and currency systems as indicated above were the changes in the ratio of gold reserve to note issues and the astonishing expansion of the latter.

The following table shows the percentage of gold held against circulating notes for twelve principal banks at the close of July, 1914, 1916, and 1917:

BAPTISTS. According to official statements there were in the United States in 1916, 6,107,686 members of this denomination as compared with 5,932,364 in 1915. The total number in the world in 1916 was 7,200,324, as compared with 7,003,737 in 1915. There were in the United States in 1916, 1986 Baptist associations, 51,248 churches, and 36,926 ministers. The Baptists are divided into two main branches known as the regular Baptists, who include the Northern and Southern Baptists and several smaller branches. The Northern Baptists had in 1916, 1,338,759 members, 8531 ordained ministers, and 9646 churches. The Southern Baptists had, in 1916, 4,744,178 members (these figures include colored Baptists in the South of whom there were 2,150,929), 41,602 churches, and 28,395 ordained ministers. The larger of the smaller denominations are the Primitive Baptists with about 101,500 communicants; the Free Baptists (see below); the Free Will Baptists, with about 60,500 members; and the General Baptists, with about 34,250 communicants.

There are in addition several smaller divisions of the colored Baptists. The general work of the larger denominations is under the supervision of the Northern Baptist Convention and the Southern Baptist Convention. The missionary work of the Northern Baptists is conducted by the American Baptist Foreign Mission Society, the American Baptist Home Mission Society, and the American Baptist Publication Society. The Southern Baptists have their own agencies. Their foreign missionary work is carried on through the Foreign Mission Board at Richmond, Va., and the home mission work through the Home Mission Board at Atlanta, Ga. The Sunday School and publication work is done through the Sunday School Board at Nashville, Tenn. For foreign missions in 1916 the Baptists contributed \$1,211,901, as compared with \$1,231,664 in 1915; for home missions, \$924,645 in 1916, as compared with \$965,698 in 1915; and for State Missions there was contributed \$993,180, as compared with \$1,059,914 in 1915. The Baptists maintain 14 theological seminaries and have under their control 101 colleges and universities. There were in 1916 43,597 Sunday Schools as compared with 42,769 in 1915; 335,620 officers and teachers in 1916 as compared with 325,475 in 1915; and 3,535,038 Sunday School pupils, as compared with 3,288,902 in 1915. See BAPTISTS, FREE.

**BAPTISTS, FREE.** This denomination has been practically united with the regular Baptist denominations. In some States the term United Baptists is used to show the consolidation of the different denominations. The movement towards union was started in 1911, by the transfer of the part of the Free Baptists of their denominational and missionary activities to the three national mission organizations of the Northern Baptists: the American Baptist Foreign Mission Society, the American Baptist Home Mission Society, and the American Baptist Publication Society. No full statistics of the present membership of the denomination are available.

**BAR ASSOCIATION, AMERICAN.** The fortieth annual meeting was held at Saratoga Springs, N. Y., on September 4-6, 1917. On Tuesday morning, September 4, Edgar T. Brackett, of Saratoga Springs, made an address of welcome, which was followed by the address of the President of the Association, George Sutherland, of Utah, on "Private Rights and Government Control." On Tuesday evening United States Senator Thomas W. Hardwick, of Georgia, presented a paper on "The Commerce Clause of the Constitution of the United States." On Wednesday, September 5, the session was presided over by Jacob M. Dickinson, of Illinois, and the time was occupied by reports of standing and special committees. At Wednesday evening's session, when Stephen S. Gregory, of Illinois, presided, addresses were delivered by Charles Evans Hughes on "War Powers Under the Constitution," and by Robert McNutt McElvoy, of New Jersey, on "The Representative Idea and the War." On Thursday morning, September 6, William H. Burges, of Illinois, gave an address on "A Hothouse Constitution; Mexico; 1917." On Thursday afternoon, during which Alton B. Parker presided, Maitre Gaston de Beval, of the Bar of Brussels, addressed the Association on "Prussian Law as Applied in Belgium," during which the legal aspects of the

execution of Edith Cavell, the British nurse, were considered. The annual dinner was held at 7 P. M. The regular business programme of the association was varied by the routine work of different subsidiary and allied bodies of the association, such as the conference of Bar Association delegates, the comparative law bureau, the section of patent, trade-mark, and copyright law, the judicial section, and the national conference of commissioners on uniform State laws. There were 10,885 members of the association in 1917. The officers in the same year were: President, Walter George Smith, of Philadelphia, Pa.; secretary, George Whitelock, Baltimore; treasurer, Frederick E. Wadhams, Albany. The forty-first annual meeting of the association will be held at Cleveland, Ohio, August 28-30, 1918.

**BARBADOS.** Barbados is a British colony situated in latitude 13° 4' North and longitude 59° 37' West, and is the most easterly of the Caribbee Islands. It is nearly 21 miles long by 14 in breadth, and contains an area of 106,470 acres, or about 166 square miles, with a population (1915) of 180,516.

Bridgetown, the chief town and port, is situated in the parish of St. Michael, in latitude 13° 5' 42" North and longitude 3° 58' 29" West. This town contains, according to the census of 1911, 16,648 inhabitants; Speights-town, the only other town, has about 1500 inhabitants.

**BARGE CANAL.** See CANALS.

**BARGES.** See CANALS.

**BARLEY.** The world produces normally about 1,485,000,000 bushels of barley but in 1917 figures were lacking as to production for many of the more important barley-growing countries, so that trustworthy estimates of the world's crop could not be made. According to data supplied by the International Institute of Agriculture, Rome, the countries of the northern hemisphere, not including Belgium, Denmark, Germany, Austria-Hungary, Russia, Rumania and other Balkan countries, and India, produced 586,280,000 bushels. The crops of the countries of the southern hemisphere which were harvested early in 1917 were given by the same authority as aggregating 8,619,000 bushels. The production of Argentina, owing to drouth and locust injury, was only 2,163,000 bushels which was less than one-half normal.

The United States, which furnishes about one-eighth of the world's barley supply, produced 208,975,000 bushels on 8,835,000 acres. This production was surpassed in 1912 and 1915 but the acreage was the largest ever devoted to the crop. The average yield per acre was 23.7 bushels which was 0.2 of a bushel above that of 1916 but 2.7 bushels under the average acre yield for the five-year period 1911-14. The average farm price on December 1 was 113.7 cents per bushel, the highest on record, and the total value of the crop was \$237,539,000 which

was also the highest ever reached. The value per acre on this basis was about \$26.95 as compared with \$20.79 in 1916 when the corresponding price was 88.1 cents per bushel. The average farm value on December 1 had not reached a dollar per bushel since 1868. As in the preceding year the States leading in acreage and production were California, Minnesota, and North Dakota.

The Canadian crop was estimated at 51,684,000 bushels, or greater by 8,914,000 bushels than the year before, and valued at \$58,620,000. The total production of the United Kingdom was reported at 60,167,700 bushels, as compared with 54,934,000 bushels in 1916. In every barley-producing country of the world the exports of the crop were subject to regulation which ranged from government supervision and approval to absolute prohibition. In some countries a heavy export duty was imposed. Prices also were fixed by many governments. As instances may be mentioned that the British government in August, 1917, fixed the price at \$1.63 per bushel, the French government in October at \$1.76, while in Germany the maximum price was placed at \$1.71 in March and in Austria at \$1.63 in August. These prices were changed from time to time or were based on a sliding scale.

**BARLOW, JANE.** An Irish novelist, died April 17, 1917. The daughter of J. W. Barlow, vice-provost of Trinity College, Dublin, she was born in 1860 at Clontarf, near Dublin. Her special distinction was as an interpreter of Irish village life. Occasionally she wrote in verse. Dublin University gave her an honorary degree of doctor of letters. Among the books published by Miss Barlow between 1892 and 1913 were: *Bogland Studies, Irish Idylls, Kerrigan's Quality, The End of Elflintown, Maureen's Fairing, Mrs. Martin's Company, Creel of Irish Stories, From the East Unto the West, From the Land of the Shamrock, Ghostbereft and Other Stories, From Beach and Bog Land, Irish Ways, Flaws, and Doings and Dealings.*

**BABOTSELAND.** See RHODESIA.

**BASEBALL.** America's national game not only thrived during 1917 despite the war but also added to its popularity. Professional baseball suffered in a sense, for several of the minor leagues were forced to disband before their seasons were completed. The major leagues on the other hand had a fairly prosperous year. The attendance at the games in the large cities fell off somewhat during the latter part of the summer but this was probably as much due to the one-sided pennant races as to any other cause.

The world championship contests in October witnessed a return to the usual conditions as far as the fan was concerned for in only one former year did the attendance and receipts reach higher figures than in 1917.

The majority of the leading colleges cancelled their schedules when they saw their star players deserting the campus for the camp but the smaller institutions of learning continued their usual activities on the diamond. As a result of the war, baseball was carried to England and France by every transport that sailed

from American shores. The Canadian soldiers had already been playing the game both in England and behind the trenches in Flanders and France and the United States troops and ambulance units gave the pastime another boost "over there."

Organized baseball in the United States responded most generously to the call of the national government for aid in the promotion of the war. Of the 300 major league players, seventy-five had joined the colors by the close of the year. The first recognized star of the game to enter the military service was Hank Gowdy, the brilliant catcher of the Boston Braves. Gowdy enlisted at the height of the baseball season and is now with his regiment in France.

The American League officials won well-merited praise by their stand. Chiefly through the efforts of Capt. T. L. Huston, part owner of the New York American League Club, military training was adopted by each of the clubs in the organization. The national government furnished each team with an officer to direct the drilling which soon became a feature of practically every game.

Captain Huston, not content with this excellent service, left his club in mid-season and organized a regiment of engineers under the direction of the government, and his command was among the first to be sent to the French front to perform the engineering work necessary before the advent of U. S. troops.

Clarke Griffith, manager of the Washington American League Club, recognizing the demand for baseball paraphernalia among the soldiers and sailors, both in the United States and in Europe, initiated a movement which resulted in the collection of thousands of dollars. Entire companies were fitted out with baseball bats, balls, gloves, etc., by means of this fund.

The New York Giants won the National League pennant in fairly easy fashion while the Chicago White Sox captured the American League honors after a keen struggle with the Boston Red Sox, world champions in 1916, the Detroit Tigers, and the Cleveland Indians. In the contest for the world championship the White Sox were successful, winning four of the six games played.

This was the first time that New York and Chicago teams had been contenders in the baseball classic but the games did not attract such large crowds as had been expected. The total attendance (paid admissions) was 186,654 and the total receipts, \$425,878. The players on the winning team each received \$3528.13 and the losers, \$2548.14.

The series opened in Chicago on October 6, the White Sox winning by a score of 2 to 1. Cicotte and Schalk were the battery for Chicago, while Sallee and McCarty were in the points for New York. Each team made seven hits and one error. The scores of the other games follow:

October 7—White Sox, 7 runs, 14 hits, 1 error; Giants, 2 runs, 8 hits, 1 error. Batteries, Faber and Schalk; Schupp, Anderson, Perritt, Tesreau, McCarty, and Rariden.

October 10—Giants, 2 runs, 8 hits, 2 errors; White Sox, 0 runs, 5 hits, 3 errors. Batteries, Benton and Rariden; Cicotte and Schalk.

October 11—Giants, 5 runs, 10 hits, 1 error; White Sox, 0 runs, 7 hits, 0 errors. Batteries,

Schupp and Rariden; Faber, Danforth, and Schalk.

October 13—White Sox, 8 runs, 14 hits, 6 errors; Giants, 5 runs, 12 hits, 3 errors. Batteries, Russell, Cicotte, Williams, Faber, and Schalk; Sallee, Perritt, and Rariden.

October 15—White Sox, 4 runs, 7 hits, 1 error; Giants, 2 runs, 6 hits, 3 errors. Batteries, Faber and Schalk; Benton and Rariden.

According to the composite score, the White Sox outhit the Giants, the percentages being .274 for Chicago and .256 for New York. In fielding the Giants had a slight margin, the figures being .953 for New York and .952 for Chicago.

The playing of Eddie Collins, of the White Sox, at second base, his batting, and his base-running stood out most prominently throughout the entire series. Collins handled thirty-four chances in the field without making an error, batted for an average of .409, and stole three bases. The most amusing incident of the series occurred in the final game in New York when Heinie Zimmerman, the Giant third baseman, vainly tried to catch Collins in a sprint from third base to the plate. Another White Sox player deserving of mention is Urban Faber, whose steady pitching made the victory of the White Sox possible.

The Giants who distinguished themselves during the series were Rube Benton, Benny Kauff, and Davey Robertson. Benton made the best showing in the box of any of the New York twirlers and, had he received proper support, the outcome might have been different. Kauff made two home runs in one of the games, a feat never before accomplished in the diamond classic. Robertson had the satisfaction of compiling the highest batting average on record. His average with the stick was .500.

The prediction of the experts of the game that the Giants would have little difficulty in winning the pennant were borne out by the result. During the early part of the season Christopher Mathewson's Cincinnati Reds made a spurt which carried them to the top, but they soon dropped back. The Brooklyn Dodgers, winners of the 1916 pennant, made a sorry showing, finishing in seventh place.

The batting honors for the year in the National League went to Eddie Roush, centre fielder of the Cincinnati Reds, whose average was .341. The other leading hitters were: Rogers Hornsby, St. Louis Cardinals, .327; Zack Wheat, Brooklyn Dodgers, .312; Benny Kauff, New York Giants, .308; Heinie Groh, Cincinnati Reds, .304; George Burns, New York Giants, .302. The best team batting was done by the Cincinnati Reds, whose average was .264. The New York Giants were second with .261 and the St. Louis Cardinals third with .250. The New York Giants led the National League in team fielding with a percentage of .9683. The Philadelphia club was second with .9673 and the St. Louis Cardinals third with .9669.

Grover Cleveland Alexander, of the Philadelphia club, was the most effective pitcher in the National League. He won thirty games and allowed the lowest number of earned runs per game. Ferdie Schupp, of the New York Giants, had a higher winning percentage than Alexander, but permitted more runs to the game.

One of the biggest baseball deals ever made was put through in December when the Phila-

delphia Club sold Alexander and William Kilfiter, catcher, to the Chicago Cubs for an amount said to have been \$50,000.

The pennant race in the American League was much keener than in the National. The Chicago White Sox had considerable trouble shaking off the Boston Red Sox, world champions in 1916, while the Cleveland team also put up a hard fight until the closing weeks of the campaign.

Tyrus Cobb, of the Detroit Tigers, regained his crown as the leading batter in the American League and in all baseball, compiling an average of .383. George Sisler, of the St. Louis Browns, finished second to Cobb with .353 and Tris Speaker, of the Cleveland Indians, winner of the laurels in 1916, was third with .352.

Eddie Cicotte, of the Chicago White Sox, was the premier pitcher of the American League, winning 28 games and losing 13 and at the same time holding his opponents to the lowest number of earned runs per game.

The final standing of the National League club was: New York won 98, lost 56; Philadelphia won 87, lost 65; St. Louis won 82, lost 70; Cincinnati won 78, lost 76; Chicago won 74, lost 80; Boston won 72, lost 81; Brooklyn won 70, lost 81; Pittsburgh won 51, lost 103.

The final standing in the American League was: Chicago won 100, lost 54; Boston won 90, lost 62; Cleveland won 88, lost 66; Detroit won 78, lost 75; Washington won 74, lost 79; New York won 71, lost 82; St. Louis won 57, lost 97; Philadelphia won 55, lost 98.

The pennant winners in the more important minor leagues were: International, Toronto; American Association, Indianapolis; Pacific Coast, San Francisco; Southern, Atlanta; Central, Grand Rapids; New York State, Wilkes-Barre; Eastern, New Haven.

**BASKETBALL.** The American intercollegiate basketball championship in 1917 was won by the Yale University team with 9 victories and 1 defeat. Princeton finished second, winning 8 games and losing 2, and Pennsylvania was third with 5 games won and 5 games lost. The record of the other teams was: Dartmouth won 4, lost 6; Columbia won 3, lost 7; Cornell won 1, lost 9. The leading scorer of the year was Kinney, of Yale, who gathered a total of 130 points from 43 field goals and 44 goals from foul.

The universities of Illinois and Minnesota divided the honors in the Western Intercollegiate Conference, each scoring 10 victories as against 2 defeats. Purdue occupied third place, winning 7 games and losing 2. The other teams finished as follows: Wisconsin won 9, lost 3; Indiana won 3, lost 5; Chicago won 4, lost 8; Ohio won 3, lost 9; Northwestern won 2, lost 10; Iowa won 1, lost 8.

Washington State College was the victor in series played by the Pacific Coast Conference Colleges, winning 8 of the 9 games contested. The standing of the other five was: University of California won 5, lost 1; Oregon Agricultural College won 6, lost 7; University of Washington won 5, lost 7; Stanford University won 0, lost 6; University of Oregon won 0, lost 8.

The national Amateur Athletic Union basketball championship games were played at the Second Regiment Armory, Chicago, under the auspices of the Illinois Athletic Club, on March

14, 15, 16, and 17. The series brought into conflict sixteen of the strongest teams in the United States. The Illinois Athletic Club five captured the title through its defeat of the Brigham Young University team. The score was 27 to 14. Montana State College won third place by triumphing over the Seward Park Blues, 16 to 9.

The basketball rules committee of which Dr. Joseph E. Raycroft, of Princeton University, is chairman, made only one change in the playing regulations. This rule provides that the entire background of the court shall be regarded as within bounds, thereby giving the player an additional leeway of two feet under the basket. The change was made because of the fact that a player has often been deprived of a well-earned field goal by what might be properly termed the technicality of being out of bounds.

**BASSERMAN, ERNST.** A German statesman, died at Baden-Baden, July 25, 1917. He was born in 1854 and after entering political life served as a member of the Reichstag for many years. He was leader of the National Liberals, and from the beginning of the European War in 1914 supported the most aggressive methods of carrying on the conflict. He was particularly hostile to the British, emphasizing the necessity of fighting them until defeated, advocating for that purpose the unsparing use of submarines and the bombarding of open towns by Zeppelins. He opposed the peace resolution made by Matthias Erzburger before the Chief Committee of the Reichstag on July 7, 1917. Basserman was a firm friend of Admiral von Tirpitz and supported his war policy.

**BATEMAN, KATE JOSEPHINE.** An American actress, died in London, April 9, 1917. She inherited her talent for the stage, for her father, Colonel H. L. Bateman, was an actor, theatrical manager, and playwright; her mother was an actress. She was born in 1842 in Baltimore, Md., and made her debut, as a child, in *The Babes in the Wood*. A few years later she appeared in New York and London in *Richard III* and in *Evangeline*. Perhaps she was best known for her Shakespearean rôles, which included Portia, Juliet, and Lady Macbeth. One of her greatest successes was gained in *Leak the Forsaken* and another in *Medea*. After her marriage to George Crowe, former editor of the London *Daily News*, in 1866, she left the stage temporarily. In *Macbeth* she appeared with Henry Irving, who was a "discovery" of her father's. In 1892 she founded a school of acting in London. She was last seen in *The Younger Generation* in 1912.

**BATTLE CRUISERS.** See BATTLESHIPS AND OTHER WAR VESSELS; NAVAL PROGRESS.

**BATTLESHIPS AND OTHER WAR VESSELS.** At the end of 1917 the tendency of warship construction was still in the general direction of increase of size in order to obtain improved offensive and defensive qualities, but in vessels of the light cruiser, destroyer, and submarine type the movement, exhibited in the past three or four years, towards separation into two or more classes of different size and attributes was becoming more marked.

**BATTLESHIPS.** In all navies, each battleship of new type laid down in 1917 was larger than its predecessors. According to reports from Germany late in 1916 plans had been prepared

for two battleships. They were to have triple bottoms, the outer one armored to a thickness of eight inches abreast boilers and engines. The armament was to consist of eight 16-inch guns and the speed to be 25 knots. No mention was made of the displacement except that it would be considerably greater than that of previous ships. Whether any such vessels actually were commenced was unknown at the end of the year. The new Japanese battleships, one laid down in 1916 and one in 1917, were of 32,000 tons, 1200 tons larger than the ships of the *Hiuga* class which preceded them. But the greatest increase in size was made in the new U. S. battleships of the 1917 programme. These were of 42,600 tons, 10,000 tons larger than any which had preceded them in any navy. They were to be heavily armored, carry 12 16-inch guns, and have a speed of 23 knots.

**BATTLE CRUISERS.** According to German reports, the new British battle cruisers completed in 1917 were of 30,000 tons, 32 knots speed, and were armed with 8 16-inch guns. These details were not confirmed from British sources. The new U. S. battle cruisers were of 34,800 tons, 35 knots speed and carried 10 14-inch guns. A new German battle cruiser while on her trial trip in 1917 was badly injured by striking a mine. Others were reported to be building and their armament, speed, and armor was said to be greater than those of previous ships of their class, but details were lacking.

**LIGHT CRUISERS.** The new light cruisers of 7100 tons and 35 knots speed which were building for the United States navy were the largest of their class although Japan had laid down one of about the same size in 1917. The displacement of British light cruisers grew steadily from 2700 tons in 1904 to 5400 tons in 1912. In that year a new 30-knot, 3600-ton class appeared and the vessels proved to be so successful that, with some changes in the battery (the new ones carried 6 6-inch guns), a large number (perhaps 20) were later built. Realizing the importance of the class for operations with and against destroyers, Japan laid down a similar vessel in 1917 and expected to follow it with others. Since the war began, Germany had built several light cruisers and was reported to have others under construction. Their details were unknown at the end of 1917. All the earlier cruisers were armed with 10 or 12 4.1-inch guns. The ease and dispatch by which they were sunk by British cruisers carrying 6-inch guns may have led the Germans to the mounting of larger guns on the new craft. The latest French light cruisers were of 4500 tons, carried 8 5.5-inch guns, and had a speed of about 30 knots. Three had been completed and it is possible that others were building.

**DESTROYERS.** The destroyers building in 1917 were of three types—the flotilla leader of 1500 to 2000 tons, the heavily armed fast destroyer of 1100 to 1300 tons, and the light destroyer of 600 to 800 tons. The average tonnage of the new boats was about 1100 because the United States was building several hundred destroyers, most of which were commenced in 1917. All were said to be of the same type—1085 tons, 35 knots speed, 4 4-inch guns, 4 triple torpedo tubes—though it was possible that some flotilla leaders had been laid down. The new German destroyers which were com-

pleted in 1917 were of about 1200 tons and carried 3 4.1-inch guns. A larger type, reported as having a displacement of 1500 tons and carrying 5.9-inch guns, was said to be in hand, but the correctness of the report was doubtful. No destroyer of high speed could carry an ordinary 6-inch gun or withstand the shock of its discharge. If 5.9-inch guns are mounted they must be short, light, and of low velocity. Such a piece might be exceedingly useful at close quarters. Many flotilla leaders of about 1900 tons were built for the British navy since the war began and others were said to be in hand at the end of 1917. In addition to acting as flag-boats they were used as scouts and skirmishers to drive in the enemy's smaller craft. Two British leaders defeated a squadron of six German boats of recent type, destroying two and compelling the others to flee. See NAVAL PROGRESS; SUBMARINE OPERATIONS; SUBMARINES.

**BAVARIA.** A European kingdom, in area and population the second of the states composing the German Empire, Prussia being first. The capitol is Munich. Below are shown the area and the population according to the census of December 1, 1910, as compared with that of December 1, 1890:

	Sq. miles	Population	
		1890	1910
Bavaria proper ....	27,004.7	4,866,643	5,950,206
Palatinate .....	2,289.8	728,339	937,085
Total .....	29,293.5	5,594,982	6,887,291

Bavaria covers about 14.0 per cent of the area of the German Empire and had in 1910 about 10.6 per cent of the population. Its area is about one-half that of the State of Georgia. In 1816 Bavaria had 3,607,000 inhabitants; in 1864, 4,775,000; in 1900, 6,176,057. The average annual increase from 1816 to 1910 was 0.69 per cent; from 1900 to 1910, 1.09 per cent. In 1910, communes having 2000 inhabitants or more aggregated a population of 3,079,022. Roman Catholics numbered 4,863,251 (70.61 per cent); Evangelicals, 1,942,658 (28.21 per cent); other Christians, 13,963 (0.20 per cent); Jews, 55,065 (0.80 per cent).

Bavaria has a bicameral parliament. The lower house consists of 163 members elected for six years by direct vote. The king in 1917 was Ludwig III, born Jan. 7, 1845. He became regent in succession to his father, Prince Luitpold, who died December 12, 1912, and was proclaimed king, November 5, 1913, in succession to his cousin, King Otto (died October 12, 1916) who had long been mentally incapable.

**BEAR ISLAND.** See POLAR RESEARCH.

#### **BEAUX-ARTS INSTITUTE OF DESIGN.**

An organization incorporated in 1916 to carry on and develop the courses in design hitherto conducted by the Society of Beaux Arts Architects. With the society it was housed in its own building at 126 East Seventy-fifth Street, New York City. It offered three courses: Architectural Design; Sculpture, including Architectural Ornament; and Mural Painting. In the instruction given in these courses, the Institute had associated with itself the Society of Beaux Arts Architects, the National Sculpture Society, and the Society of Mural Painters, from which societies it drew instructors who

gave their services gratuitously. There were no fees of any kind excepting a registration fee of \$2.00 per annum for the course in Architectural Design. The Atelier System, resembling closely that of the Ecole des Beaux Arts of Paris was adopted in each department. There were 111 architectural ateliers in correspondence situated in 90 different cities of the United States and Canada, aggregating 774 registered students. It had 316 students registered in the Sculpture Department, working in its own building. Circulars of information concerning the different courses will be mailed on application. The object of the Institute and the Society was to perpetuate the principles and associations of the Ecole des Beaux Arts in Paris. The officers of the Institute in 1917 were: Thomas Hastings, chairman of the Board of Trustees; William Lawrence Bottomley, secretary; Lloyd Warren, treasurer and director of the Institute.

**BECKWITH, JAMES CARROLL.** An American portrait and genre painter, died October 24, 1917. He was born in Hannibal, Mo., September 23, 1852, and studied painting in Chicago, New York, and with Carolus Duran and Yvonne in Paris in 1873-78. Returning to New York in 1878 he was soon after elected a member of the Society of American Artists and in 1894 was elected to the National Academy of Design. He was for eighteen years professor at the Art Students' League, New York, and was elected a member of the National Institute of Arts and Letters. A fine example of his decorative ability was seen in his work on one of the domes of the Manufacturers' Building at the Chicago Exposition of 1893, but portraiture occupied his chief attention. His best known portraits include those of Mark Twain, Colonel Appleton, Judge Palmer, General Schofield, and the Ogden and Parish families. He had a notable exhibit at the World's Fair at St. Louis in 1904, including "The Nautilus" and portraits of Mrs. Beckwith and F. H. Hitch; in 1905 he produced several portraits, including that of Richard H. Ewart. He also exhibited portraits of Col. Charles Henry Jones (1906), Harold de Raasloff (1909), and "The Veil" (1912). The Military Academy at West Point, and Yale and Johns Hopkins Universities possess portraits painted by him. A fine collection of his crayon and pencil drawings is in the New York Public Library.

**BEES.** See ENTOMOLOGY.

**BEET SUGAR.** See SUGAR.

**BEHRING, EMIL ADOLPH VON.** A famous German bacteriologist, died at Marburg, April 1, 1917. He was born March 15, 1854, at Hansdorf, Prussia, studied medicine in Berlin, and for a time was an army surgeon. He and Ehrlich have been called "twin sons of science and humanity" (they were born within a day of each other). Both became assistants to Koch in the Institute for Infectious Diseases, one in 1890 and the other in 1891. Koch set Behring, who had already studied questions relating to immunity to disease, to the investigation of disinfectants, but he found that any disinfectant strong enough to affect bacteria through their protecting membrane would first injure the tissue cells beyond repair. He therefore returned to the study of bacterial toxins.

"He soon succeeded," says the *Journal* of the American Medical Association (April 7, 1917), "in immunizing animals with attenuated bacterial toxins against diphtheria and tetanus, and announced in 1890 that immunity is a humoral process, due to some newly acquired specific antitoxic power developed by the blood serum." This discovery led to the actual production of diphtheria antitoxin, to which Ehrlich contributed. In 1894 Behring accepted the chair of hygiene at Halle, but after 1895 he was identified with Marburg, where he had charge of the institute for hygienic research, with its medical farm. To the latter he gave most of what he received in prizes. In 1901, at the first distribution of the Nobel prizes, he received that in medicine. He had previously received, with Roux of the Pasteur Institute, a prize of \$5000 from the Paris Academy of Medicine, and \$10,000 came to him from the French Academy of Sciences. He was appointed a member of the Prussian Privy Council and was given a title of nobility. In later years he devoted much attention to tuberculosis, the result of which was a bovivaccine that rendered cattle immune, a triumph in its field which it was hoped would lead to the discovery of a vaccine for man. When Behring returned to the field of diphtheria, "he developed a means of inoculating against this disease. By injecting a practically balanced mixture of diphtheria toxin and antitoxin, the human body proceeds to elaborate its own antitoxin. He found that the serum from persons thus actively immunized might be used for curative and preventive purposes. He hoped by this means to vaccinate people against diphtheria so that in time diphtheria would be exterminated as completely as smallpox now is." (*Journal* of the American Medical Association, April 7, 1917). His publications included *Die Blutserumtherapie* (1892), *Bekämpfung der Infektionskrankheiten* (1894), and *Beiträge zur experimentellen Therapie* (1900).

**BELGIAN CONGO.** See CONGO, BELGIAN.

**BELGIAN RELIEF COMMISSION.** See RELIEF FOR WAR VICTIMS.

**BELGIUM.** A kingdom of central Europe, anciently inhabited by the Belgæ (a Celtic-speaking Germanic tribe), and part of the Gallia Belgica of the Romans. In 1815 the country was joined to the kingdom of the Netherlands, but recovered its independence by the revolution of 1830. By the constitution of 1831 it was declared a constitutional, representative, hereditary monarchy, and on June 4, 1831, Prince Leopold of Saxe-Coburg was chosen hereditary king. By the treaty of London, 1831, signed by Great Britain, France, Austria, Prussia, and Russia, Belgium's neutrality was guaranteed; and during the Franco-Prussian War of 1870 her neutrality was rigidly observed by the belligerent Powers. But upon Sir Edward Gray's inquiry, July 31, 1914, concerning the attitude of the European Powers towards this question, while France immediately affirmed her intention to adhere to her guarantee, Germany returned evasive answers. An ultimatum sent to Germany failing to elicit the required assurance that the neutrality of Belgium would be respected, upon information, August 4, 1914, that Belgian territory had been invaded, Great Britain entered the war. The Germans at present occupy the country and have established

a civil government there. The Belgian government has removed its seat temporarily to Le Havre, France. An estimate purporting to be authentic reports that the Germans succeeded in occupying 11,130 square miles, or more than 97 per cent of the total area of Belgium. They now hold approximately 11,008 square miles, or 96 per cent of the total. A little over 1 per cent of the Belgian territory which the Germans held before the battle of the Marne is therefore all that has been recovered from them.

**AREA, POPULATION, ETC.** Belgium has a frontier of 831 miles, and is bounded on the north and east by the Netherlands (268 miles), on the south and west by France (381 miles), on the east by Germany (60 miles) and the Grand Duchy of Luxembourg (80 miles), with a seaboard of 42 miles. The Meuse and its tributary, the Sambre, divide it into two distinct regions; that in the west being generally level and fertile, while the table-land of the Ardennes, in the east, has for the most part a poor soil. Its great harbor and commercial entrepôt is Antwerp, a strongly fortified city on the Schelde. The other harbors are Ostend, Nieuport, Blankenberg, and Zeebrugge.

Few of Belgium's thriving towns in the path of the German invasion have suffered more than has Ypres, situated on the Yperlee River (a tributary of the Yser), about 35 miles south of Ostend. The inhabitants (about 17,000) were among the first victims, as the Germans occupied the town October 3, 1914. They were driven out before the end of the year by the British who continued to hold this section of the line. Mons, a manufacturing and trade centre of about 30,000 inhabitants, the centre of a rich coal region and the capital of Hainaut, was the scene of the battle which preceded the Anglo-French retreat ending on the banks of the Marne. A recent order from German headquarters gave instructions for the deportation of its citizens. Zeebrugge, the seaport of Bruges, lies 15 miles north of Ostend and 60 northwest of Brussels. A prosperous city of 50,000 people before the war, it has served the Germans as a submarine base and has been in that capacity the objective of Allied airplane raids. Should the Allies win control of the coast of Belgium as far inland as Bruges, they would not only hamper the enemy's submarine operations but would themselves come into possession of a splendid system of canals extending from France to Furnes, and thence by way of Nieuport to Ostend and Bruges. There is also a canal from Bruges to the coast near Blankenberg, another to Ghent, and a third to the waterway connecting Heyst with Ghent. A railroad parallels the coast from the French border to the Dutch frontier.

Large numbers of the civil population, both male and female, having been deported and others murdered by the German invaders, in addition to losses in the army on the field of battle, only the antebellum population can be given. In the following table will be seen the area by provinces in square kilometres, the population for 1912 and that for 1831:

	Sq. km.	1912	1831
Antwerp .....	2,832	1,004,909	349,942
Brabant .....	3,283	1,522,941	561,828
West Flanders.....	3,234	884,777	608,228
East Flanders.....	3,000	1,134,079	742,973
Hainaut .....	3,722	1,247,042	613,179

	<i>Sq. km.</i>	<i>1912</i>	<i>1931</i>
Liège .....	2,895	896,649	375,080
Limburg .....	2,408	284,171	160,090
Luxemburg .....	4,418	282,500	160,762
Namur .....	3,860	364,319	213,784
Total Belg. ....	29,451 *	7,571,387	3,785,814

\* 11,371 square miles.

A report comes from Amsterdam to the effect that the German governor-general is to divide that country's ministries of agriculture, industry, art and science, and labor into Flemish and Walloon ministries. In point of population the Walloon district of Belgium is considerably smaller than the Flemish, the latest census showing some three million Walloons and four million Flemings, but in area the Walloons have a slight advantage. The advantage in population grows out of the fact that three of the four largest cities—Brussels, Antwerp, Ghent—are in Flemish territory, while Liège alone lies south of the imaginary boundary line running in a southwesterly direction from Aix-la-Chapelle (Aachen) to Lille. The term "Walloons" is used to designate those Belgians who speak French or a French dialect, while the Flemings are those who speak Dutch or a Dutch dialect. The Walloons are in the main confined to Hainaut, Namur, Liège, Luxembourg, and a part of Brabant.

Of the total population in 1910 (7,423,784), 2,833,334 spoke French only, 3,220,662 Flemish only, 31,413 German only, 871,288 French and Flemish, 74,993 French and German, 8652 Flemish and German, and 52,547 all three languages. The four cities of Antwerp, Brussels, Ghent, and Liège, with their environs, contained 21.16 per cent of the population of the kingdom; but the appearance of urbanization induced by these figures is offset by the fact that the dependent communes cover areas with boundaries widely separated from the urban centres; within these confines are areas devoted to agriculture.

Almost the entire population is of the Roman Catholic faith, but full religious liberty prevails, and grants are made from the national treasury to all denominations. Primary education is compulsory, the cost falling on the communes, with subsidies from the state and the provinces. The high branches of education are well provided for. Education is very largely under clerical control, which is a great grievance from the liberal and socialist point of view.

**PRODUCTION AND COMMERCE.** The north is mainly agricultural, the south industrial. The success of the manufacturing industries of the country is attributed in part to an abundance of cheap fuel easily accessible, in part to the high standard of technical education prevailing. Agriculture, mining, iron-, sugar-, and textile-manufacturing are the chief occupations; and textiles, sugar, machinery, and agricultural products are the chief exports. Raw materials are admitted free of duty, but there are small duties on manufactured goods imported. An agricultural commission exists in each province and a special council advises the government as to the best means of promoting the various national industries. The total length of the canals and navigable waterways of the country is 1350 miles, 85 per cent of which are under the direct control of the state, and the cheap transport thus rendered possible gives to all industries an incalculable advantage.

A new ministry, to be known as the Ministry for Economic Affairs, was created for Belgium in 1917. The portfolio was held by M. Paul Hymans, leader of the Liberal party, minister of state, and formerly Belgian minister in London. The department was to be assisted by an advisory council composed of some fifty prominent Belgians connected with the industrial and commercial life of their country. The duties of the new department were to consist in making preparations for the restoration and reconstruction of Belgium after the war. Since, to quote Mr. Brand Whitlock, the Germans had carried off everything in Belgium from the machines in factories and the belting to the kitchen utensils and the brass knockers on the doors of private houses, the country at the end of the war would be stripped literally bare of every tool and article needful in the mechanical, industrial, and domestic arts, and to supply this need would require unprecedented commercial transactions.

No returns for production are available since the German occupation. A British publication gives total imports for 1913 (special trade) at £183,345,000 and total exports at £143,073,000; for the first six months of 1914, at £92,126,000 and £74,159,000 respectively. A record of trade with the United Kingdom in 1915 shows imports into Belgium valued at £255,581 and exports to the United Kingdom valued at £1,291,766. Details of the 1912 and 1913 trade will be found in the 1916 YEAR BOOK.

**FINANCE AND GOVERNMENT.** The 1914 revenue amounted to 807,314,000 francs and the expenditure to 806,754,000. The debt stood January 1, 1914, at 3,743,027,438 francs, of which 3,523,067,806 francs loans at 3 per cent, and 219,959,632 francs share of the Netherlands debt at 2½ per cent. The report of the governor-general appointed by the usurping power estimates the revenue for 1916 at 248,649,935 francs and the expenditure at 274,480,435 francs.

The king of the Belgians is Albert, born April 8, 1875; succeeded his uncle, Leopold II, December 17, 1909; married, October, 1900, the Duchess Elizabeth of Bavaria, and has issue two sons, the heir apparent and Charles Theodore, born October 10, 1903; and a daughter, Marie-José, born August 4, 1906. Heir apparent, Prince Leopold, Duke of Brabant, born November 3, 1901. King Leopold II was born at Brussels, April 9, 1835, and was the son of King Leopold I, whom he succeeded December 10, 1865. He married, in 1853, the Archduchess Maria of Austria, who died September 19, 1902, and by whom he had three daughters. The eldest, Princess Louise, married in 1875 Prince Philip of Saxe-Coburg-Gotha, but the marriage was dissolved in January, 1906. The second, Princess Stephanie, widow of the late Crown Prince Rudolf of Austria, married Count Lonyay in 1899. King Albert is the second son of the late Count of Flanders, brother of Leopold II.

The French Chamber of Commerce stated that "the last reports received at Havre by the Belgian government show that Germany is requisitioning the great factories and mills of Belgium and northern France and systematically despoiling the manufactures of those countries, which were so flourishing before the war." Factories have been requisitioned to turn out munitions for the German armies, the statement continued. Wire mills are turning out barbed

wire, while thousands of French workmen are forced in the Longwy-Bas district, under the guard of troops, to turn out iron cinder, of which 600,000 tons already have been produced. Electric current for a part of the western front is being supplied by a 7200-horsepower turbine, which the Germans have installed in a Loos factory. In addition to carrying into Germany all church bells and other bronze materials, the Germans "during the last three or four months have sent trains of ten to fifteen trucks loaded with agricultural machinery from the north of France through Belgium to Germany. The slag heaps of all the blast furnaces in Belgium have been cleared away and sent to the front, and at Malcour the German authorities have had the greater part of the railway and joinery shops destroyed. In most of the large factories Germans are destroying the machinery and sending the spoils across the Rhine. Pieces of machinery which cannot be used are broken up for shrapnel."

#### HISTORY

On January 10 the Belgian government gave its entire support to the response of the Allies to President Wilson's note on the terms of peace, and in addition declared its gratitude to the United States for the services rendered by the latter to the population of invaded Belgium. It was announced on February 9 that the Germans were building a large number of railways in Belgian Ardennes. In May Baron von Falkenhause, the successor of von Bissing as governor-general, levied, in addition to the existing war tax of 50,000,000 francs a month, a supplementary war contribution of 10,000,000 francs. An important feature of his administration was its adherence to the policy of separating the Walloon from the Flemish districts. Each had a separate administration.

**DEPORTATIONS.** The protests against German methods in Belgium particularly in the matter of deportations continued in January. The Dutch government's protests against the practice brought from the German authorities on January 12 a permission for those Belgians who had been deported after returning from Holland to leave Germany and such of them as were employed were allowed to go back to Belgium while the unemployed were required to go to Holland. On January 17 a letter from the papal secretary of state to Cardinal Mercier was published showing that the Pope had approached Germany on the subject of the deportations and had directed Cardinal Mercier to do all in his power to help the sufferers. Cardinal Mercier instructed the priests to care for the interests of civilians and to do all they could to aid the families of the deported men. The German defense of her deportation of Belgians was presented to the United States State Department on January 20. According to this the British blockade had paralyzed the industries of Belgium and had made unemployment almost universal. More than a half a million people were dependent upon the public charity and if the 293,000 wives and 612,000 children were added the figures rose to 1,560,000; that is to say, one-fifth of the whole population. The German method according to the document provided them with a welcome means of escaping unemployment or the humiliation of public charity. It defended the course of the military au-

thorities as necessary and as not in violation of the principles of international law and humanity. It concluded with an invitation to the United States to send a member of its embassy in Berlin to visit the persons who had been deported and inform himself about their condition. On January 24 Ambassador Gerard was instructed to accept the German government's offer. On March 15 it was announced that the Emperor had ordered the deportations to be temporarily discontinued and that he had directed the governor-general of Belgium to restore to Belgium those who had been wrongly sent to Germany as unemployed. As to the feeling of the civilian population in Belgium and the difficulties which resulted from the German policy see the article **RELIEF FOR WAR VICTIMS**.

The other side of the affair was made public on April 8 when the United States State Department gave out hitherto unpublished letters from an official who had investigated conditions in Belgium. The German treatment of the non-combatants was characterized as inhuman. The real reason for deporting the unemployed was said to be because they needed skilled workmen and such workmen were naturally out of employment in Belgium now that her industries were destroyed. The condition in Belgium was described as a reign of terror in the course of which an uninterrupted series of trials of alleged spies was going on, but the chief atrocity was the policy of deportations. Down to January 10, 1917, it was said that nearly 90,000 Belgians had been deported, frequently under the threat of soldiers backed by machine guns. The German contention that the Belgians voluntarily signed contracts, worked for high pay, etc. was declared to be a trick and it was said that the German military authorities tried by force to make the Belgians sign such contracts and only did so by the exercise of extreme brutality. It was said that in order to deceive civilians the Germans divided the Belgian workers into two classes: namely, those who volunteered for forced labor and those who did not. To the former were promised a good salary and the care of their families by Belgian institutions. The others were required to work for thirty pfennigs a day and were told that their families would not be supported. It was charged that brutal methods were employed in order to force men to work. The chief means was starvation. It was said that in Ghent a large number of men had died from the effect of brutal treatment or the conditions under which the work was done. Great numbers of the Belgians who had been returned from Germany were ill or dying. It was said that in no instance had a German promise of liberal pay for volunteers been kept. See **WAR OF THE NATIONS**.

**BELGIUM, COMMISSION FOR RELIEF IN.** See **RELIEF FOR WAR VICTIMS**.

**BENCKENDORFF, ALEXANDRE CONSTANTINOVITCH, Count.** A Russian diplomat, ambassador to the Court of St. James's from 1903, died January 11, 1917, in London. He belonged to a well-known Roman Catholic family of the Baltic provinces, and was born in 1849. His education was obtained in France and Germany, after which he entered the diplomatic service when 20 year old. For 10 years he left the service, but by 1886 he was first secretary of the embassy at Vienna and from 1897 to 1903 served as

Minister at Copenhagen. Count Benckendorff did much to further Anglo-Russian friendship. Since his coming to London the Anglo-Russian agreement of 1907 relating to respective spheres of influence in Persia was signed, and this led the way to the Triple Entente. The Count, who was especially popular in the English capital, had been made honorary president of the Russo-British Chamber of Commerce, formed shortly before his death to advance the interests of trade between the two countries.

**BENEDIOT XV, POPE.** See ROMAN CATHOLIC CHURCH; WAR OF THE NATIONS, *The Diplomacy of the War*.

**BENEFACTIONS.** See GIFTS AND BEQUESTS.

**BEREA COLLEGE.** A co-educational and non-sectarian institution located at Berea, Ky., in the heart of the great mountain region of the South in whose people the College has taken particular interest. Students in the fall of 1917 numbered 1416 and there were 112 members of the faculty. Volumes in the library numbered 34,500. More than a thousand donors in 1917 contributed to an Efficiency Fund (started more than two years previously). In addition there were in 1917 productive funds amounting to \$1,500,000, the income from which was about \$60,000. Berea College was founded in 1855. President, William G. Scott, Ph.D., D.D., LL.D.

**BERMUDA.** The "Bermudas" or "Somers' Islands" constitute a British colony; they are a group of about 300 small islands, situated in the western Atlantic Ocean, in lat. 32° 15' N., and long. 64° 51' W., about 580 miles to the eastward of Cape Hatteras in North Carolina, the nearest point of the neighboring American continent. The total area is estimated at 19 square miles, with a population (1915) of 20,801. Commerce and finance statistics follow:

	1910	1912	1913	1915
Imports ....	\$517,074	\$637,178	\$570,575	\$579,828
Exports ....	108,508	116,586	90,695	104,467
Revenue ....	78,593	88,629	80,576	97,643
Expenditure ..	83,392	78,210	87,779	107,666
Shipping * ..	688,315	1,273,666	1,255,866	1,748,377

\* Tonnage entered and cleared.

**BESSARABIA.** The southwesternmost government of Russia, extending from Galicia southeasterly to the Black Sea. On the northeast and east it is separated from the Russian governments of Podolia and Kherson by the Dniester River, and on the southwest and west from Moldavia by the Pruth River. On the south it is separated from the Dobruja by the Danube River. The area is stated at 17,143 square miles, which is about equal to the land area of Vermont and Massachusetts combined. Population, 2,686,600, according to the estimate of January 1, 1915. The inhabitants are Moldavians and other Rumanians, Little Russians, Poles, Bulgars, Jews, Armenians, Greeks, and Tatars. More than two million of the people are dependent on agriculture. The capital of Bessarabia is Kishinev, which, before the great war, had an estimated population of 128,700. It was reported, upon its entrance into the war (August, 1916), that Rumania was to receive part of Bessarabia on account of the large Rumanian population there. See RUSSIA, *History*.

**BIBLE SOCIETY, AMERICAN.** The war had

a disturbing effect upon the working of the Society during 1917, but there were also many reasons for encouragement. The reduced income and increased cost of publication produced their inevitable result. According to the report of the Board of Managers for 1917, which gave the latest available statistics in default of an unusually late annual report, the issues of the Bible for 1916 were much less than for the year before. The Bible House issued 2,301,847 in 1916, over 400,000 volumes less than those of the previous year; and the issues in the Foreign Agencies were 2,776,244, or over 1,300,000 less than the previous year. As no report was received in 1917 from certain of the Society's regular correspondents, comparisons could not justly be made concerning the number of their issues. The Society had issued during its one hundred and one years, in America, 73,838,152 volumes of the Scriptures, and in foreign lands, 49,454,207 volumes. The circulation of the Scriptures in the foreign agencies showed a relative decline in 1916, being 3,447,769 volumes as compared with 3,706,112 for the preceding year. The circulation in the home agencies was also less in 1916, being 1,157,217 as compared with 1,184,991 the previous year. The agency among the colored people showed a substantial increase in 1916, being 49,176, the largest in the history of the agency. In order to accomplish this, eleven colporteurs, together with the Agent, visited 319 towns and villages. The territory of the United States was divided into the northwestern, South Atlantic, Western, Pacific, Southwestern, Eastern, Central, and Atlantic agencies. In 1916 there were 1412 workers employed in distributing the Scriptures, 935 in foreign fields and 477 in the home field. In addition to these there were 515 voluntary workers. The revision of the Spanish New Testament for use in Central and South America was completed; but work on the Japanese New Testament was not yet finished. Progress had been made on various other versions of the New Testament for foreign fields. The Society has an annual expenditure of from \$600,000 to \$800,000, and an endowment that yields about \$85,000. The president in 1917 was James Wood of New York; the corresponding secretaries, Rev. Drs. John Fox and William I. Haven; and the treasurer, William Foulke.

**BICYCLING.** See CYCLING.

**BILLIARDS AND POOL.** Nathan Hall of Boston, who became a lieutenant in the Army, captured the highest honors in amateur billiards during the year 1917 by winning the national Class A 18.2 balkline tournament played at Boston in March. Hall was undefeated in the six games contested. Second place went to Ledyard Blake, who won 4 games and lost 2. Edward W. Gardner, Eugene L. Milburn, and T. Henry Clarkson were tied for third, each winning 3 games and losing 3. The Class B amateur championship was won by C. E. White, who played 5 games without suffering a defeat. J. Rice was second with 4 victories and 1 defeat, while G. T. Moon, Jr., and C. P. Matthews were tied for third with 3 victories and 2 defeats each. The Class C title went to C. B. Terry.

The three-cushion emblem was much buffeted about during the year. It passed through the hands of George W. Moore to Charles McCourt to Robert L. Cannefax, to Alfredo de Oro. Ches-

brough S. Otis was to meet de Oro in a championship contest at Havana in January, 1918. William F. Hoppe set a new world mark at three-cushions when he made an unfinished run of 15 in a 20-point match with Charles Patterson of St. Louis.

William Gershell won the first Poggenburg Memorial balkline handicap with Edward T. Appleby second and F. S. Appleby third.

In professional billiards William F. Hoppe remained king of the balkliners, going through the season without receiving a challenge. Welker Cochran, a young player from Chicago, by his wonderful showing throughout the year, gave promise of making Hoppe extend himself to defend his laurels after the former has obtained a bit more experience.

J. Howard Shoemaker of New York retained the amateur pocket billiard (pool) championship for the fifth successive year. Edward F. Reynolds and William A. Tilt were tied for second place in this tournament.

Frank Taberski successfully defended his title of professional pocket billiard champion by defeating James Maturo, Benjamin Allen, Louis Kreuter, Lawrence Stoutenburgh, and Joseph Concannon.

**BIRTH CONTROL.** Beginning in 1914 an active propaganda for the spread of knowledge of birth control has repeatedly claimed the attention of a wide public. The most conspicuous cases were those of Mrs. Margaret Sanger and her sister, Mrs. Ethel Byrne, who established a birth control clinic in a thickly populated district of Brooklyn, N. Y. They were arrested on indictments obtained under a section of the New York penal code which forbade the dissemination by any means whatever of knowledge regarding contraceptives. Their plan had been to instruct Jewish mothers in methods of control at a nominal charge of ten cents for registration in their clinic. Their registration clerk, Fania Mindell, was also arrested. The latter was convicted of having sold a book entitled *What Every Girl Should Know* and was fined \$50. Mrs. Byrne was convicted on January 22 and sentenced to the workhouse for 30 days. She entered upon a "hunger strike"; after three days she was forcibly fed and after nine days she was pardoned by Governor Whitman on the understanding that she would thereafter discontinue her dissemination of forbidden information. The Governor's action was in consequence of nation-wide publicity and a special petition signed by many women. At the trial of Mrs. Sanger it could not be shown that she either sold contraceptives or literature on birth control; moreover her attorney asked for a dismissal of the case on the ground that the law was unconstitutional. She was, however, judged guilty and sentenced to 30 days in the workhouse.

At Chicago a Citizens' Committee on Family Limitation was formed in the spring by an interested group of university professors, physicians, lawyers, social workers, and their wives.

They first obtained from the Attorney-General of the state an opinion regarding the legality of the dissemination of knowledge of control methods. Their plan was to hold public meetings calling attention to the importance of the problem but to disseminate scientific information only in private interviews. It was the opinion of the Attorney-General that in Illinois there was no statute similar to that in New York penalizing the giving of any advice or information on the subject, but that the matter was largely discretionary with physicians who might give such advice as in their judgment was advantageous to the physical health and welfare of mothers. The committee thereafter sent a statement of principles to the papers signed by seventeen prominent physicians, lawyers, ministers and others and began the formation of clinics. Subsequently there was introduced into the Illinois legislature a bill sponsored by a Catholic member, imposing restrictions as drastic as those of the New York law upon dissemination of information.

Consequent upon the publicity achieved by the Pittsburgh Birth Control League and similar agitation in other Pennsylvania cities there was introduced in the Pennsylvania legislature a bill providing a penalty of not less than \$250 and imprisonment for not less than three months for "any person who shall disseminate or impart or attempt to disseminate or impart information or knowledge tending to interfere with or diminish the birth of human beings" either orally or in writing or by printed matter. This was subsequently passed by the legislature but vetoed by Governor Brumbaugh, who in a long message declared that if enacted such a law would be "more honored in its breach than in its observance." In many cities there were agitation and repeated thrusting of the matter upon public consciousness. In Cleveland, Mrs. R. D. Mitchell was arrested on a charge of having in her possession birth control literature. Believing her prosecution unjust, numerous prominent club women who were mothers of families aroused the greatest public interest in the entire question. In New York City Dr. Morris H. Kahn, prominently connected with the Mount Sinai Hospital and the New York Department of Health, publicly announced that he was disseminating information about contraceptives to poor women coming to dispensaries of the Department in direct violation of the penal code. He stated that investigation showed that abortions are much more frequent among women ignorant of all methods of control than among those who have even inadequate information.

Birth Control Leagues were formed during 1916 and 1917 in nearly every important city, including the following: New York, Chicago, Philadelphia, St. Louis, Boston, Cleveland, Ann Arbor, Los Angeles, San Francisco, Portland, Ore., Seattle, Detroit, Racine, Wis., Milwaukee, St. Paul, Minneapolis, Spokane, Denver, Indianapolis, Washington, D. C., and Pittsburgh. These were brought into the National Birth Control League, with headquarters at 104 Fifth Ave., New York City. Mr. Frederick A. Blossom resigned as business manager of the Cleveland Associated Charities to become head of this national organization and editor of its *Birth Control Review*. The first issue of this monthly appeared in February "dedicated to the princi-

ple of intelligence and voluntary motherhood." Mr. Blossom soon resigned the editorship but after suspending some months the *Review* again appeared in December under new management. About the same time appeared the *Birth Control News*, to be issued occasionally by the Birth Control League of Ohio, with headquarters in Cleveland. This bore the heading "The rational limitation of offspring is not only a right but a duty; the state should recognize that right and teach that duty."

**BIRTH RATE.** See VITAL STATISTIC.

**BLACK LIST.** See TRADING WITH THE ENEMY ACTS.

**BLENK, JAMES HUBERT.** An American Roman Catholic prelate, died in New Orleans, La., April 20, 1917. He was born at Edenkoben, Bavaria, in 1856. He received his education at St. James's College, Baltimore, and at Jefferson College, in St. James Parish, La. Entering the Society of Mary in 1874, he went abroad to study in Marist Houses of Studies in France and Ireland. As an ordained priest, he returned to the United States in 1885, and accepted a professorship in Jefferson College. Of this he became president in 1891. After making a tour of the Marist institutions in Europe and serving as auditor of an apostolic delegation to Cuba and Porto Rico, he was consecrated bishop of the latter island in 1899. Seven years later he was appointed archbishop of New Orleans. Archbishop Blenk was a convert to Catholicism from the Lutheran Church.

**BLISS, TASKER HOWARD.** An American soldier, appointed September 21, 1917, Chief of Staff of the Army of the United States in succession to Gen. Hugh Lenox Scott (q.v.). He was born December 31, 1853, at Lewisburg, Pa., and studied for two years at the university of that city (now Bucknell University). He graduated from the Military Academy at West Point in 1875, was professor of military science at the Naval War College in 1885-88, and was for two years military attaché to the American legation at Madrid. After the close of the Spanish-American War, in which he had served during the Porto Rican campaign of 1898, he was made Collector of Customs at the Port of Havana and in 1902 was appointed special envoy to Cuba to negotiate the treaty of reciprocity between Cuba and the United States. He became commandant of the War College in 1903, held command in the Philippines in 1905-09, and in the early part of 1911 commanded the provisional brigade on the southern California border during the Mexican Insurrection, and later the Western Division for a short time. After August 12, 1911, he was successively in command of the Department of the East, of the Southern Department and the Cavalry Division. Appointed Assistant Chief of Staff on February 15, 1915, he was promoted November 20, 1915, to major general of the United States Army. After the departure of Gen. Hugh L. Scott, with the American Mission to Russia, headed by Elihu Root (q.v.), Gen. Bliss became Acting Chief of Staff. After his appointment as Chief of Staff he reached the age of retirement on December 31, 1917, but was immediately re-appointed.

**BOHEMIA.** A crownland and titular kingdom of Austria, occupying the northwestern part of the Empire. It is bounded by the Kingdom of Saxony and the Prussian Province of Silesia on the north, Moravia on the east, Mo-

ravia and Lower and Upper Austria on the south, and Bavaria on the west. Bohemia has an area of 20,057 square miles, being about half the size of Kentucky and, after Galicia, the largest of the Austrian crownlands. The population, as returned by the 1910 census, was 6,769,548, as compared with 6,318,897 in 1900; the natural increase in the decade was 622,405 and the net emigration, 171,554. The estimated population in 1913 was 6,860,029. Of the Austrian population present at the 1910 census, persons whose vernacular was German numbered 2,467,724 (36.76 per cent); Bohemian, Moravian, Slovak, 4,241,918 (63.19 per cent); Polish, 1541; Ruthenian, 1062. Of the inhabitants in 1910, Catholics numbered 6,477,536 (95.69 per cent); Evangelicals, 176,941 (2.61 per cent); Jews, 85,826 (1.27 per cent). In 1910 there were dependent on agriculture (including forestry) about 32.3 per cent of the population; industry and the trades, 41.1 per cent; commerce and transportation, 13.2; public and military service and without vocation, 13.5. The capital and largest city of Bohemia, and the second city of Austria, is Prague; it is the seat of a German and a Bohemian technical high school and a German and a Bohemian university. Its population (including environs), as estimated June 30, 1914, was 541,500. Population of Pilsen in 1914, 84,800; Budweis, 46,300; Aussig (Ústí nad Labem), 40,000. Bohemia has a unicameral diet of 242 members; it is represented in the lower house of the Austrian Reichsrat by 130 members. See AUSTRIA-HUNGARY.

**BOILERS.** During 1917 the general tendency to employ larger generating units had its effect in a demand for boilers of increased capacity, and at the same time the trend towards higher pressure accompanied by superheat, which has been noted in previous issues of the *YEAR BOOK*, continued. The pressure limit for a standard boiler in the United States was placed at 350 pounds, although pressures of from 500 pounds to 600 pounds were expected within a few years, and experimental work in the design and development of such boilers was under way. In the year under review, pressures up to 250 pounds were common, though 300 pounds was about the highest for steam turbines, and the higher pressures were proposed in a number of new stations which were being planned. A boiler constructed for 350 pounds pressure had been in successful operation in Great Britain at the works of the British Thomson-Houston Company. At Joliet, the Public Service Company of Northern Illinois, in its new central station plant, installed cross-drum boilers for 350 pounds pressure and 225 degrees of superheat, this installation marking the limit for American boilers of standard design. In this boiler the plates of the drum were  $1\frac{1}{4}$  of an inch thick, and the longitudinal seam was a quadruple-riveted butt joint with double covered straps. The boiler tubes were of lower gauge than in boilers designed for 250 pounds pressure, and in the economizer tubes the metal was  $\frac{1}{4}$  of an inch in thickness.

Another notable plant was that of the Buffalo General Electric Company whose boilers were of the cross-drum type, having 11,400 square feet of steam-making surface and were designed for a 250 pounds pressure, and 275° of superheat, giving a total steam temperature of 689°. The

initial boiler installation was 60,000 kw. in three units, fired at both ends by two 15-retort end-feed stokers capable of supplying 15 tons per boiler per hour, and affording a grate area ratio to heating surface of 1 to 27.3. The evaporation per square foot of heating surface was 14.4 pounds.

Another important development of the year was the Stevens and Pratt boiler made up in four sections, each composed of a complete Babcock and Wilcox cross-drum boiler and having its own superheat economizer and draft-fans. This unit was made up of two sections on the same side with the boilers placed end to end, and had one stack. The unit occupied 7632 sq. ft. of floor space, and was complete in itself with the exception of the coal bunkers, and avoided the elaborate boiler-room construction usually seen.

The scarcity of fuel during the year led to the adoption of various underfeed stokers to burn the high-ash bituminous coals of the Middle West and lignite, while for large quantities of anthracite coal the duplex stoker was being more used. Another attempt of the year in the interest of economy was to apply forced draft to a chain grate, but with bituminous fuel solution of the problem was considered practically impossible, though promise was made in efforts with anthracite.

With the increase in boiler pressure, steam velocities also increased, and at the Joliet plant of the Public Service Company of Northern Illinois, a velocity of 7200 ft. per minute was secured at normal load in the turbine leads. In other cases, this velocity was exceeded and in this way it was possible to reduce pipe diameters and minimize the cost of pipe line construction. The increased use of instruments of the recording type in the boiler-room continued, and on account of the high cost of fuel economies and greater efficiency were sought after as never before, for in many plants the husbanding of the coal supply was a vital matter.

The United States Bureau of Standards announced the results of an investigation made at the request of the Steamboat Inspection Service on the subject of steam boiler plates. In the course of this work, it was developed that the specifications heretofore enforced had been unnecessarily severe, and might be relaxed so as to increase the output without any sacrifice of safety. The Bureau of Standards recommended that the sulphur limit be raised from 0.04 per cent to 0.05 per cent though no change was made in the phosphorus which remains at the maximum of 0.04 per cent. New conditions of test were adopted for plate material and the rule for determining the working pressure of the flat surfaces of boilers was also modified.

During 1917 the American Uniform Boiler Law Society organized to secure the legal adoption of the boiler code of the American Society of Mechanical Engineers, made considerable progress in having the various legislatures pass the enabling acts creating boards to draw rules which usually embodied the code of the Society of Mechanical Engineers. In some cases, the Boilermakers' Union succeeded in having a rider attached to the enabling act which provided that only boiler-makers should be appointed as inspectors, and this rider usually succeeded in defeating the

proposed law. The new code by 1917 had been adopted or was about to be enforced in New York, New Jersey, Pennsylvania, Ohio, California, Minnesota, Wisconsin, Michigan, and Indiana, and the cities of St. Louis and Kansas City, Mo. The bill failed of passage for various reasons in Washington, Oregon, Texas, Tennessee, Rhode Island, New Hampshire, South Dakota, Iowa, Utah, and Kansas. See STEAM ENGINE; STEAM TURBINE.

**BOKHARA.** A Russian vassal state in central Asia. Estimated area, 83,000 square miles; estimated population, 1,500,000. Capital, Bokhara, with about 75,000 inhabitants. Other towns are: Karshi (25,000), Hissar, Khuzar, and Shahr-i-Zabz (about 10,000 each). Mohammedanism prevails. Russians in the country number upwards of 10,000. The town of Bokhara is only a few miles from the line of the Trans-Caspian Railway, which traverses the country; the length of the railway within Bokhara is 186 miles. The Ameer in 1917 (from January 6, 1911) was Sayid-Mir-Alim Khan.

**BOLIVIA.** An interior republic of South America. Historically, the capital is Sucre, which is still the seat of the supreme court, but the executive and legislative departments of government are at La Paz, where also the foreign diplomats are resident.

**AREA AND POPULATION.** According to an official estimate, the area is 1,379,014 square kilometres (532,437 square miles), or, including disputed territory, 1,458,034 square kilometres (562,047 square miles). Another estimate, which is perhaps as nearly satisfactory as any until the Paraguayan boundary is determined, is 514,690 square miles. The area of 532,437 square miles is approximately twice the size of the State of Texas. A recent estimate of population is about 2,890,000, but this may be regarded as excessive; probably another recent estimate of about 2,268,000 is more nearly correct. The 1900 census showed a population of 1,744,568; of this number, 50.9 per cent were Indian, 26.7 per cent mestizo, 12.7 per cent white, 0.21 per cent negro, and 9.4 per cent unclassified. The bulk of the population, both rural and urban, is resident in the great lofty plateau of western and central Bolivia. Estimated population of the larger towns: La Paz, about 100,000; Cochabamba, 31,000; Sucre, 30,000; Potosí, 30,000; Oruro, 25,000; Santa Cruz, 22,000; Tarija, 10,000; Trinidad, 6000.

**EDUCATION.** A large part of the population is illiterate. Primary instruction is free and nominally compulsory, but probably not more than 60,000 pupils are registered in primary schools. For secondary education there are a few so-called colleges and other institutions. Higher or special instruction is offered by several establishments, as the university and the normal school at Sucre, the university and the school of commerce at La Paz, the school of languages at Potosí, the schools of mines at Potosí and Oruro, and the agricultural and veterinary school at Cochabamba. The normal school at Sucre is said to rank among the best of its kind in South America. The state religion is Roman Catholicism, but the exercise of other forms of worship is permitted.

**PRODUCTION.** Agriculture in Bolivia is important only to meet local needs and not as a factor in the foreign trade; cultivation of the soil has not become extensive or highly de-

veloped. The products include corn, barley, rice, potatoes, beans, etc. Coffee, coca, and quina are also produced and have a place in the foreign trade. By far the chief product of the soil commercially is rubber, large quantities of which are gathered in the northern forests. The export value of Bolivian rubber is exceeded in South America only by that of Brazil. But its mineral resources constitute the republic's chief source of wealth. The country contains deposits of nearly all known metals, some of them widely distributed and very rich and abundant. Formerly Bolivia stood third among the silver-producing countries of the world, and now, among the tin-producing countries, ranks second only to the Federated Malay States. The tin zone in Bolivia is divided into four districts—La Paz, Oruro, Chorolque, and Potosí. The commercial centre of the industry is the city of Oruro, which is also the centre of the Bolivian railway system. The tin-mining country is much in the Cordillera Real, and the lodes are found at altitudes of from 11,000 to 16,000 feet. After tin the important metals now mined are copper, antimony, bismuth, silver, and tungsten.

**COMMERCE.** Imports and exports in 1914 were valued at 39,761,222 bolivianos (\$15,506,876) and 65,801,146 bolivianos (\$25,662,447) respectively; in 1915, 22,574,567 bolivianos (\$8,804,081) and 95,210,351 bolivianos (\$37,132,037). The boliviano is here valued at 39 cents. In thousands of bolivianos imports and exports have been as follows:

	1911	1912	1913	1914	1915
Imports ....	58,371	49,509	54,763	39,761	22,575
Exports ....	82,631	90,123	98,722	65,801	95,210

Classified imports are stated as follows, in bolivianos:

	1913	1914	1915
Live animals.....	2,230,284	1,912,926	927,740
Food and drink....	10,353,546	9,508,142	9,425,682
Raw material.....	4,706,631	5,197,835	2,943,177
Manufactures .....	34,095,872	20,017,819	9,277,968
Gold and silver, including coin.....	3,376,500	3,125,000	.....
Total.....	54,762,833	39,761,222	22,574,567

Classified exports, in bolivianos:

	1913	1914	1915
Live animals.....	117,310	238,860	792,860
Food and drink....	27,760	75,036	140,800
Raw material.....	90,000,808	59,878,942	90,236,165
Manufactures .....	261,199	286,605	295,843
Gold and silver, including coin.....	3,314,436	5,321,694	3,744,682
Total.....	93,721,513	65,801,146	95,210,350

The principal imports are cotton and woolen goods, provisions, machinery and hardware, wines and spirits, and apparel. The following table shows the principal exports in metric tons, valued in thousands of bolivianos, in 1914 and 1915:

	1914	1915
	Tons	Tons
Tin concentrates..	37,260	36,492
Copper barilla and ore .....	8,667	23,813

	1914	1915
	Tons	Tons
Antimony ore.....	156	17,928
Rubber .....	4,485	5,055
Bismuth ore.....	550	663
Silver, uncoined....	72	82
Wolframite .....	276	792
Coca .....	848	389
Hides .....	374	613
Silver coin.....	21	398
Lead ore.....	1,555	2,208
Gold ore.....	291	307

Of the tin concentrates, the United Kingdom took, in 1915, almost the entire export, namely, 35,358 metric tons, valued at 43,490,505 bolivianos. The United Kingdom also took in 1915 nearly one-half the copper barilla, a quarter of the copper ore, practically all of the bismuth, and over 90 per cent of the antimony. The United States took over 90 per cent of the rubber. By principal countries, imports and exports were as follows, in thousands of dollars:

	Imports	Exports
	1914	1915
United States.....	1,808	9,757
Peru .....	1,115	31
United Kingdom.....	3,045	25,988
Chile .....	2,140	291
Argentina .....	1,006	565
Germany .....	4,144	25
France .....	413	319
Brazil .....	308	65
Spain .....	206	52
Total, incl. others.	15,507	37,137

**COMMUNICATIONS.** Between 1906 and 1917 eleven railway lines were constructed in Bolivia, totaling upwards of 660 miles. On July 4, 1917, the Oruro-Cochabamba line (125 miles) was opened to traffic, bringing the total length of railway in operation to 840 miles. There remained some 350 miles under construction. The Bolivian railways are connected, so that the chief towns, excepting Sucre, have rail communication. The railway has not yet been extended to Sucre. La Paz, Oruro, Cochabamba, and Potosí have rail communication with the Chilean ports of Arica and Antofagasta and (aside from the country about Lake Titicaca, which is traversed by steamer) with the Peruvian port of Mollendo. It is of interest to note that construction continues on the line from Tupiza to La Quiaca (56 miles). The latter town, on the Argentine frontier, is the terminal of a branch of the Argentine railway system. From Tupiza northwest to Atocha is a stretch of 65 miles without railway. Thus the completion of 121 miles of line, between Atocha and La Quiaca, will put La Paz in rail communication with Buenos Aires.

In 1917, there were in operation in Bolivia about 840 miles of railway and under construction about 1100 miles with some 3000 more or less definitely proposed. The important construction work involved the extension of Yungas railway from La Paz to Coripata, and thence to Rurrenabaque on the Beni River. The route then leads from Cochabamba to Santa Cruz, and from Santa Cruz to Trinidad, and from Potosí to Sucre, the latter section nearing completion in 1917. With the completion of the section from Tupiza to La Quiaca, which was

under construction in 1917, there would be a through connection between the Pacific and Atlantic at Buenos Aires, Argentina. This through line was of interest as being a part of the proposed Pan-American railway route. The financing of the La Quiaca-Tupiza and La Paz-Yungas lines was carried on in France and the United States, while the Potosí-Sucre line was being built with appropriations from the government of Bolivia. The National Congress of Bolivia had authorized the guaranteeing of \$5,000,000 for a line from Tupiza to Atocha. The total cost of the railway construction by the Bolivian government up to 1917 amounted to \$30,316,965, while the American capital invested in the foreign railway projects was estimated at about \$17,000,000. Of the proposed projects, the extensions of the Potosí-Sucre Railway to Puerto Suarez on the Paraguay River which was said to be controlled by an Italian syndicate, the Fomento de Oriente Boliviano, involved a length of line of between 425 and 450 miles and a cost in excess of \$10,000,000; the right-of-way for this project by 1917 had been partly surveyed. To meet the Argentine line being constructed from Embarcación to Yacumba on the frontier, a Bolivian project of a line 250 miles southward from Santa Cruz was being discussed. Concession had been granted by the government for the construction of the line and the surveyors had examined a large part of the route. To connect with the Argentine line at La Quiaca on the frontier, Bolivian interests had surveyed a line from Tarija, Bolivia, in the centre of a rich agricultural area. This line would probably not exceed 125 miles in length.

Telegraphic communication is established with foreign countries and between the principal towns, including all the departmental capitals. Reported length of line, 6858 kilometres (4259 miles); offices, 216. There are several radio-telegraph stations.

**FINANCE.** Bolivia's standard of value is gold. The monetary unit is the boliviano; its par value is 38.932 cents, 12.5 bolivianos being equivalent to one pound sterling. Revenue is derived chiefly from import and export duties and taxes. The estimated revenue and expenditure for 1916 were 16,034,500 and 22,573,338 bolivianos respectively. The public debt, as reported for June 30, 1916, amounted to 53,211,355 bolivianos, the foreign debt being 36,340,595 and the internal debt 16,870,760.

**GOVERNMENT.** The legislative power is exercised by a congress of two houses, the Senate and the Chamber of Deputies. Senators (16 in number) are elected for six years, and deputies (75) for four years, all by direct vote. The suffrage is held by every male citizen over twenty-one years of age who can read and write and has a fixed, independent income. The executive power is vested in a president, who is elected by direct vote for four years, and is ineligible for the next term. Two vice-presidents are elected for the same period. The president is assisted by a cabinet of six ministers. For the term beginning August 14, 1913, the president was Ismael Montes, who succeeded Eliodoro Villazón. On May 6, 1917, the leader of the Liberal party, José Gutiérrez Guerra, was elected president and on August 15 was inaugurated at La Paz for the four-year term. The new first and second vice-pres-

idents respectively are Ismael Vázquez and José S. Quinteros.

**HISTORY.** Bolivia followed the example of other neutrals in protesting against the German menace. The note, which was made public in the United States on February 12, declared that the German government was trying to abolish by its own will the rules which, according to international law and practice, permitted neutrals to carry on their trade, and that the effect of this was to force neutrals in a way to enter the war. The note declared that the Bolivian government had resolved to consolidate its attitude with that of the government of the United States. On April 13 it was announced that the Bolivian government had handed the German Minister his passports and a note breaking off negotiations. The note referred to the sinking of a Bolivian vessel which was sailing in neutral waters and which had on board the Bolivian Minister. The vessel (the *Tubantia*) was sunk by a German submarine. While announcing the rupture of diplomatic relations the note declared that German subjects as well as German property would enjoy their legal rights so long as they kept within the law themselves. On May 7 José Néstor Gutiérrez, minister of war, was elected president to succeed General Ismael Montes. It was reported that the defeated candidate, De Escalier, had taken refuge in the Argentine legation at La Paz on account of a revolutionary movement in the departments of Oruro and Potosí. The new president was inaugurated on August 17.

**BOLL WEEVIL (BOLLWORM).** See COTTON.

**BOLSHEVIKS** (Russian, *Bolshevik*; plural of *bolshevik*). A nickname originally applied to the majority (Russ., *bols'hinstvo*) at the second Congress of the Russian Socialist Party in 1903, as opposed to the *Mensheviks*, or minority. At that time the two wings differed merely on the subject of party administration; in the course of time, however, the breach between the two kept ever widening. The *Mensheviks* advocate social transformation through a process of gradual reform and education of the masses, while the *Bolsheviks* are International Communists, their programme including a revolution of the proletariat of all countries and government control by, and in the interest of, the proletariat, to the exclusion of all others. Although now a minority among Russian Socialists, the appellation of *Bolsheviks* has stuck to these extremists, but the word *bolshevik* is not, as has been often stated, the Russian for a "maximalist" and "extremist." See RUSSIA, *History*.

**BOOTS AND SHOES.** Throughout the world the boot and shoe industry as well as the leather trade generally felt the effects of the war and the shortage of hides and leather. The vast amount of boots and shoes, as well as other manufactures of leather required for the armies of the world, led to a curtailment of the product for civilian use, especially in Europe. In Germany wooden soles made of beech wood were treated so as to become pliable and found extensive use during the year, and were well liked by those wearing them. By a German edict of October 13, all shoes in Belgium except wooden shoes were requisitioned and in many cases this order even went into the households.

In France, England, and Italy, the prices of shoes were being fixed, at least for the poorer portions of the population, and in the first named country, a government standard shoe was selling at from \$2.75 to \$4.87, according to quality, the retailers' profit being from 45 cents to 75 cents. Various patterns were available for the manufacturers who were obliged to work under special contract and minute instructions. No attempt had been made to employ standardized lasts, but shoes made of special leathers and cloths were encouraged. In Italy, the government was operating its own shoe factories, turning out a standardized national style which was commented on as having more utility than beauty. In Great Britain, an official order prohibited the manufacture of women's boots with uppers over seven inches in height if of leather, or of eight inches if of any other material.

In Switzerland, standard shoes were developed and were to be placed on sale early in 1918. There was no movement for a standardization of shoes for civilians in the United States but it was believed that there would be a general tendency to cut down the number of styles and introduce various economies.

It was reported that there had been an increase in repairing shoes in the United States, and manufacturers were preparing various economies for the ensuing year. There was an increased use of rubber and various artificial products for soles, a number of which were giving considerable satisfaction. In May and June the Commercial Economy Board studied the possibilities of conserving leather by simplifying shoe styles and a number of conferences were held with tanners, last makers, shoe manufacturers, and also merchants and retailers. Various measures of coöperation were inaugurated, and it was hoped that the available leather would be most economically used in the future.

During the year, the United States Bureau of Census issued a bulletin with the shoe-making industry covering the year 1914. This bulletin showed that for the year under review there were 1300 shoe manufacturing establishments in the United States with an annual output of nearly 300,000,000 pairs of shoes, with an average production for a single factory of approximately 220,000 pairs annually, an increase over conditions in 1909 when the average annual output was less than 200,000 pairs. This obviously indicated that the average factory was increased in size, and a further consideration of the statistics indicated that the tendency towards concentration in the shoe industry continued.

**ARMY SHOES.** Throughout the United States generally 21,000,000 of shoes were contracted for in 1917 for the Army and Navy, and fifty factories were engaged in this work. Three hundred thousand pairs of rubber boots for soldiers in the trenches were contracted for in October, 1917, and the American supply was placed before that which was being furnished for the armies of Great Britain and France.

An interesting development was the large number of short size army shoes, by which it became apparent that the American recruits had larger feet than had been figured in the tables of sizes developed by the Quartermaster's Department. This led to a substantial reor-

ganization and the ordering of larger shoes, but at the same time it was responsible for a shortage at a number of the camps.

Foreign service particularly made the further adjustments necessary and the commanding officer in France recommended the dropping of the smallest size and the narrowest widths in all sizes, and added various widths in sizes 13 and 14, size 12 having been the largest size previously called for by the army tables. The question of the supply of shoes for the Army figured in the Congressional investigation of the War Department and brought out a number of interesting developments. The Munson last used by the Army was criticized by shoe manufacturers in that it was too short and too wide, while the system under which shoes were fitted to the individual soldiers came in for much unfavorable comment.

The U. S. Department of Labor in a report stated that employment in the boot and shoe industry for sixty-eight establishments was 53,170 employed in 1917, as compared with 57,094 in 1916. There was a gain in the number employed in October over September, and there was a gain of 5.5 per cent in the pay rolls for October, 1917, over 1916. In 1917, the City of Brockton, Mass., shipped 621,900 cases of 15,547,500 pairs of shoes, or 178,734 fewer cases, approximately 4,343,000 pairs less than in 1916. Of the 1917 output 3,265,000 were army shoes and over 5,000,000 were under contract for the Army and Navy in this city. Prices for such shoes ranged from \$4.65 to \$4.80 per pair. See **LEATHER.**

**BOSNIA AND THE HERZEGOVINA.** Provinces, formerly Ottoman, annexed to the Austro-Hungarian monarchy October 5, 1908. Area: Bosnia, 16,239 square miles; the Herzegovina, 3529; total, 17,769. Civil population according to the census of October 10, 1910: Bosnia, 1,631,006; the Herzegovina, 267,038; total, 1,898,044; in addition, military population, 33,753; grand total, 1,931,802, as compared with 1,591,036 in 1895. Estimated population at end of 1912, 1,962,411. The nationality of the people is principally Serbo-Croatian. Of the population in 1910, adherents of the Serbian Orthodox Church constituted 43.48 per cent; Roman Catholics, 22.88 per cent; Greek Catholics, 0.43 per cent; Evangelicals, 0.34 per cent; Jews, 0.62 per cent; Mohammedans, 32.25 per cent. According to the 1912 estimate, adherents of the Serbian Orthodox Church numbered 856,158; Roman Catholics, 451,686; Greek Catholics, 8605; Evangelicals, 6734; Jews, 12,798; Mohammedans, 626,649. Population of the larger towns in 1910: Sarajevo (Bosna Serai), capital of Bosnia and of the territory of Bosnia and the Herzegovina, 51,919; Mostar, capital of the Herzegovina, 16,392; Banjaluka, 14,800; Tuzla, 11,333; Bjelina, 10,061; Srebrenica, 7215.

Agriculture is not in a high state of development, although in 1910 the percentage of the population dependent thereon was 87.9. Nearly half of the total area is under forest. The mineral output in 1915 included: Lignite, 798,891 metric tons; iron ore, 110,410; manganese ore, 10,422. Output of metals in 1915: Pig iron, 25,701 metric tons; rolled iron, 14,019; steel ingots, 18,933. Bosnia and the Herzegovina are included in the Austro-Hungarian customs territory. The imports from and exports

to Austria-Hungary and foreign countries in 1912 were estimated at 174,713,655 and 130,179,153 kronen respectively. In 1915 there were 956 miles of railway; in 1914, 2202 miles of telegraph line and 6625 miles of wire; post and telegraph offices, 249.

The provisional budget for 1916-17 showed revenue of 118,596,802 kronen (largely from railways and the tobacco monopoly) and expenditure of 118,573,512 kronen. The constitution of Bosnia and the Herzegovina bears date of February 17, 1910. The diet, consisting of seventy-two elective and twenty appointive members, is competent to deal with provincial finance, taxation, police, railways, public works, and civil and criminal law, subject to Austro-Hungarian veto. There is a governor and a government in six departments, while the highest administrative authority is the Austro-Hungarian minister of finance acting for the emperor-king.

**BOSTON UNIVERSITY.** A non-sectarian institution of learning located at Boston, Massachusetts. Students in the fall of 1917 numbered 3400 and there were 225 members of the faculty. Volumes in the library numbered 65,000. There were productive funds amounting to \$1,300,000 the income from which was \$60,500. The University received a bequest of \$565,000 from the will of Mrs. C. C. Cornin in 1917. Boston University was founded in 1869. President, Lemuel Herbert Murlin, D.D., LL.D.

**BOTANY.** Meetings of the Botanical Society of America, the Ecological Society of America, the American Phytopathological Society, and other affiliated societies were held in conjunction with the American Association for the Advancement of Science in New York City, December 26 to 31, 1916, and at Pittsburgh, Pa., on December 28, 1917. The South African Association for the Advancement of Science met at Stellenbosch, July 2 to 6, 1917. The meeting of the British Association for the Advancement of Science scheduled for 1917 was canceled on account of war conditions. The Botanical Society of Russia was organized at Moscow, December 16, 1916. The society has begun the publication of *The Journal of the Russian Botanical Society*.

The Third Annual Field Conference of Cereal Pathologists met at Madison, Wisconsin, July 9 to 11, 1917. A conference on the white pine blister rust was held at Albany, New York, late in 1916. A Plant Disease Survey was organized in the United States Department of Agriculture July 1, 1917, to collect information on plant diseases in the United States. Collaborators have been appointed for every State in the country.

Considerable extension was made to quarantine regulations of the United States and other countries. Federal and State quarantines were in force against the importation of white pines, currants, and gooseberries on account of the white pine blister rust. Canada also had similar restrictions in force. The Arkansas Legislature provided for a State Plant Board, which was given broad powers for preventing the introduction of insect pests and fungous diseases. Idaho and Colorado also enacted inspection laws. New Zealand prohibited the importation of all kinds of pome fruit stocks on account of the root knot disease. Queensland put into effect a Disease in Plants Act on January 1,

1917. A Commission of Plant Sanitation was created in Cuba.

The committee on bacterial classification of the Society of American Bacteriologists recently appointed has submitted its report, which recommends for bacterial nomenclature the general principles of the international rules of botanical nomenclature adopted at Vienna.

**NECROLOGY.** Among botanists of note who died within the past year were: Prof. Daniel Oliver, formerly connected with Kew Botanic Gardens; Dr. George Massee, the well-known English mycologist; Prof. H. H. W. Pearson, of the College of South Africa; W. G. Smith, plant illustrator and fungologist; Philippe de Vilmorin, a French investigator in genetics; Dr. M. Raciborski, famous for his investigations in plant diseases in Java; Dr. C. H. Peck, for many years botanist of the State of New York; Dr. H. W. Conn, an eminent bacteriologist, and J. Y. Bergen, the author of a number of botanical text-books.

**PLANT BREEDING.** A committee was formed by the British Association for the Advancement of Science to report progress on experimental studies in the physiology of heredity. Pearl suggested a simplification of methods for the estimation of the probable error of a Mendelian class frequency. De Vries described some dimorphic mutants of *Oenothera* in which the hereditary phenomena were independent of visible characters. Atkinson gave an account of twin hybrids in *Oenothera* and Davis of intercrosses and back crosses of *F. Oenothera* hybrids. East described inheritance in *Nicotiana* crosses; Harris, correlations in sugar beets; Altenburg, linkage in *Primula*; Emerson, linkage intensities; Detjen, inheritance in *Vitis rotundifolia*; Collins, hybrids between *Zea mays* and *Z. tunicata*; Frost, mutation in *Matthiola annua*; and Harris, correlations in beans.

East claimed that self-fertility was dominant over self-sterility in *Nicotiana*. Goodspeed and Clausen considered self-sterility in species crosses of *Nicotiana* due to nonspecific incompatibility. Trabut claimed that alfalfa, *Medicago sativa*, had arisen by the hybridization of two primitive species, *M. falcata* and *M. getula*. East considered bud variation so infrequent that it might be disregarded in plant breeding. On the other hand, Stout showed the possibility of establishing varieties of *Coleus* by the selection of somatic variations, and Shamel gave an account of his investigations on the improvement of citrus through bud selection. Lotzy claimed that crossing was the cause of the origin of new types which were perpetuated by heredity, natural selection being the cause of their extinction and not their origin.

Release described about forty natural hybrid oaks. Standish thought that a large number of the recently described species of *Crataegus* are true hybrids. There was a considerable number of contributions to the subject of sterility in hybrids. Moore thought that in some cases it was due to a deficiency of food materials for the pollen tube, causing a stoppage of longitudinal growth before fertilization is possible. Goodspeed and Avres reported partial sterility in *Nicotiana* hybrids, the pollen being shrunken and functionless. Ruth Cole claimed that many species of *Rosa* were hybrids and not mutants, their pollen being largely abortive.

Hoar reported pollen sterility a common character in *Rubus*, many species crosses being sterile hybrids. Backhouse cautioned against ascribing too much importance to fertility of hybrids as a guide to relationships. Cole and Wright applied the principles of line breeding to bacteria, and they claimed that many of the variations reported in ordinary cultures were due to selection, by the investigator or the environment, of preëxisting biotypes and the suppression or elimination of others.

**ECOLOGY, ETC.** Ecological studies on the factor limits of forest, grass land, and desert were reported on by the Carnegie Desert Laboratory staff. Lipman called attention to the benefit to be derived by closer coöperation between soil scientists and ecologists, many of their problems being closely related. Richter and others showed that plants required the same initial intensity of light for carbon dioxide decomposition whatever their ecological relations. Those having special adaptations for intensifying light might exist in habitats with lower illumination than other plants not so provided.

Cannon considered aëration of soil no less important than temperature and water. Iljin and others from studies of swamp and steppe plants found a close relationship between osmotic pressure and the amount of water at the disposal of the plant. Drought resistance in plants, they found, was due to their more economical evaporation of water. Yunker also reported an important relation to exist between the amount of soil moisture and the activity of transpiration and photosynthesis. Bowman claimed that the red mangrove transpires in proportion to the concentration of the medium. Gates concluded that a change in evaporation was the cause and not the result of plant successions.

Bews gave an account of the chief types of vegetation in South Africa, and he called attention to the rarity of formations or associations composed of a single species of plant. Harper made a quantitative, volumetric, and dynamic study of the vegetation of the *Pinus taeda* belt of Virginia and the Carolinas. Reed gave the results of a study of meadow formations in Colorado, and Shantz described the plant successions in abandoned roads in the same region. A number of papers on forest successions appeared within the year.

**PLANT PHYSIOLOGY, ETC.** Mirande claimed that anthocyanin is secreted by granular mitochondria. According to Moreau, rhodoxanthin originates in plastids without passing through a chlorophyll stage. Shibata reported the very common occurrence of flavone derivatives which play an important rôle in the protection of chlorophyll through the absorption of ultraviolet rays. Delft showed that the permeability of protoplasm to water might be increased rather indefinitely with a rise in temperature. Osterhout considered the claim that permeability is of a chemical nature not proven by the evidence thus far presented. Denny reported that permeability of plant membranes is affected by lipoids, tannins, and pectic substances.

Osterhout found marked differences in marine plants and parts of the same plant with respect to their tolerance to fresh water, suggesting protoplasmic differences. Brooks claimed that living protoplasm was permeable to solutions of certain salts, some increasing and others di-

minishing permeability. Sodium salts increase and calcium salts decrease exosmosis in dandelion scapes. Brown and Tinker added to the evidence regarding a semipermeable membrane in barley seeds.

Livingston and Shreve described improvements in the method of measuring the transpiring power of plant surfaces. Tomato leaves were found by Shive and Martin to increase their transpiration when coated with Bordeaux mixture. Knight claimed that there was no necessary agreement between stomatal opening and transpiration rate. Wilkie found marked individual differences in the periodicity of transpiration in quite a range of plants. Briggs and Shantz found no close agreement between the hourly transpiration and the evaporation rate in alfalfa. Livingston showed a regular periodicity in the foliar transpiration power in plants, the cycle changing from low night to high day values. MacDougal claimed that the apparent periodicity of root growth of forest trees can be explained by a scarcity of water in summer rather than any inherent tendency. Jadin and Astruc believed that arsenic in plants plays a part comparable with phosphorus and that manganese favors the oxygen reactions of plants. Brigham found that maize could assimilate certain organic nitrogen compounds through its roots, but that the assimilation was in some instances greatly facilitated by the presence of *Bacillus subtilis*.

From a study of the pea plant Sure and Tottingham believed that amids may be produced synthetically from carbohydrates and ammonia. Stoklassa showed that the potassium ion was active in the synthesis of nitrogen compounds in the plant cell, especially in the exclusion of light. Loeb considered the phenomena of geotropism due to chemical mass action of the common nutritive substances in the cell sap. Lubimenko announced the discovery of an enzyme which protects chlorophyll from decomposition during the process of assimilation. Palladin and others reported the process of reduction the most common of the enzymic activities of plants. Reed called attention to the analogy between the action of plant peroxidase and colloidal platinum. Kastle and Buckner presented evidence regarding the occurrence of oxidase in living plants. Bunzel found, in agreement with other experimenters, that acids inhibit oxidase activity. MacDougal and Spoehr reported upon a sodium cell which gives light measurements more nearly parallel with the plant than any other measure yet known. Jörgensen and Kidd suggested that formaldehyde arises from phytol which is split off from the chlorophyll molecule under the action of light and oxygen.

**MISCELLANEOUS.** Experiments for increasing plant growth were reported with varying conclusions. Investigations at Kew and Wisley seemed to cast doubt on the value of humogen, or bacterized peat, as an accelerator of plant growth. The practical value of radium compounds for promoting plant growth was questioned by Gager and others. Blackman and Jörgensen reported successful experiments with overhead discharge of electricity in which increased growth and larger yields were obtained from the electrified areas. Pickering summarized experiments on the effect of one plant or another growing near or succeeding it, and

found evidence for the toxin theory. Bottomley claimed that auximones were formed during the germination of seeds and that they enabled the embryo to utilize the food materials in the seed.

Burrill and Hansen gave the results of extensive studies of the organisms connected with nitrogen fixation by leguminous plants. All sub-families of Leguminosae were found capable of inoculation. Experiments to induce the organisms to grow on nonleguminous plants gave negative results. Forbes showed that the injury caused to plants by copper in irrigation waters was due to the effect produced in the proteids near the growing root tips. Gile and Carrero found that plants in water cultures absorb nutrients in proportion to the number of roots receiving them. The practical importance of this in connection with the application of fertilizers was pointed out. Beccari reached the conclusion that the cocoanut is of Asiatic or Polynesian origin and not American as is claimed by Cook.

Lubimenko reported successful experiments in feeding trees by the introduction of solutions into the wood, and Rankin, following the method of Shevyrev, found that lithium nitrate could penetrate the heartwood of chestnut trees three inches or less in diameter. In larger trees the substance was translocated above and below the point of feeding. Experiments by others with potassium cyanid as an internal insecticide gave negative results.

**PLANT DISEASES.** Reports were made of a number of diseases of plants due to nonparasitic causes. Crowther and Rustin described various types of injury to plants by smoke. Stone showed that illuminating gas was very injurious to greenhouse plants, roses being especially sensitive to gas poisoning. Doubt found marked variation in plants with regard to gas injury, some being destroyed by quantities of gas far below the limits of perceptible odor while others were quite resistant.

Chivers published additional data on the injurious effects of tarvia fumes on vegetation. Lipman and Gericke claimed that the solids of smelter fumes are not harmful to agricultural plants. Pickering reported that washings from plants are deleterious to the growth of other plants. Lightning injury to potatoes, cotton, sugar cane and other crops was described by various writers. Malnutrition disease of potatoes and cotton, due to lack of potash, was reported. Bioletti and Bonnet described, under the name "little leaf," a serious disease of grapes in California for which no cause had been determined. An internal disease of cotton bolls was reported in the West Indies by Nowell, and a new disease, of unknown causation, to which all native varieties of cotton in Poona is subject, was described.

Maze gave an account of an infectious chlorosis of maize in France. Sideron claimed that chlorosis was due to a lack of iron assimilation under alkaline conditions, while Freiberg considered it due to an enzyme, the original factors for which were unknown. Stewart, Reddick, and others reported a serious mosaic disease of beans. A mosaic disease of potatoes was described by Melhus. A disease of sugar cane, somewhat resembling the sereh disease in Java, appeared in Porto Rico, according to Stevenson.

Among the bacterial diseases of plants, the citrus canker, due to *Bacterium citri*, received most attention in 1917. The United States government was cooperating extensively with various state agencies for its eradication in the Gulf States. Citrus canker had appeared in South Africa and in the Philippines. Stevens found that the bacteria causing this trouble could retain their vitality in soil for more than a year. Experiments of Jehle showed practically all kinds of citrus trees were subject to citrus canker.

Bacterial diseases were described as follows: On lettuce, by Brown; tobacco, by Wolf and Foster; wheat, by Smith; oranges and lemons, by Lee; cherries, by Sackett, etc. Bonequet claimed that a species of *Bacillus* is associated with the curly top of beets. The bacterial blight of walnuts was reported in the East, but the organism did not appear so destructive as in California. Faulwetter demonstrated the dissemination of bacterial diseases through the splashing effects of rain. Smith described the mechanism of tumor growth in crown gall, and Shaw called attention to the influence of variety on the form of crown gall on apple trees.

A large number of fungous diseases of plants received attention from various investigators. The white pine blister rust became quite serious, and active measures for its control were in progress in many States. McCubbin believed that the alternate form of the fungus might winter over on currants, and Spaulding and Gravatt failed to find any species or variety of currant or gooseberry resistant to its attack. Ants, weevils, snails, and slugs were believed to be active carriers of the spores of the fungus from host to host. The chestnut blight seems to be spreading, no natural means of checking it being known. Stevens believed that its spread in the southern States would be very rapid because of favorable climatic conditions.

Extensive campaigns for the control of potato diseases were waged with considerable success in many countries. Rhizoctonia diseases of potatoes were described as occurring in Maine. Cotton advanced the theory that the potato wart disease originated on wild species of *Solanum* in Hungary. Surveys of cereal diseases in the United States were made. The *Phyodermis* disease of maize was found widely disseminated. The *Peronospora* disease of maize had become serious in Java and was being especially investigated to prevent its entry into America.

**BIBLIOGRAPHY.** Among the botanical books of 1917 or immediately previous, the following may be noted: W. R. G. Atkins, *Recent Researches in Plant Physiology* (London, 1916); F. E. Clements, *Plant Succession* (Washington, 1916); H. W. Conn, *Bacteria, Yeasts, and Molds in the Home*, revised ed. (Boston, 1917); K. C. Davis, *Productive Plant Husbandry* (Philadelphia, 1917); W. F. Ganong, *A Text-Book of Botany for Colleges* (New York, 1916); H. B. Guppy, *Plants, Seeds, and Currents in the West Indies, and Azores* (London, 1917); J. W. Harshberger, *Mycology and Plant Pathology* (Philadelphia, 1917); L. R. Hepler and H. H. Whetzel, *Manual of Fruit Diseases* (New York, 1917); E. C. Jeffrey, *The Anatomy of Woody Plants* (Chicago, 1917); H. Kraemer, *Applied and Economic Botany*, 2d ed., revised (Philadelphia, 1916); H. C. Long, *Plants Poisonous to Live Stock* (Cambridge, 1917); J. P. Lotzy, *Evolu-*

tion by Means of Hybridization (The Hague, 1916); H. Molisch, *Pflanzenphysiologie als Theorie der Gärtnerei* (Jena, 1916); W. A. Murrell, *Edible and Poisonous Mushrooms* (New York, 1916); F. R. Petherbridge, *Fungoid and Insect Pests of the Farm* (Cambridge, 1916); W. Trelease, *Pocket Manual of Woody Plants* (Urbana, Ill., 1917); W. W. Robbins, *The Botany of Crop Plants* (Philadelphia, 1917); M. Wheldale, *The Anthocyanin Pigments of Plants* (Cambridge, 1916), and W. C. Worsdell, *The Principles of Plant Teratology* (London, 1916).

**BOTULISM.** See VETERINARY MEDICINE.

**BOULDER, COLORADO.** See MUNICIPAL GOVERNMENT.

**BOWDOIN COLLEGE.** A non-sectarian institution of learning located at Brunswick, Me. Students in the fall of 1917 numbered 343 and there were 29 members in the faculty. Volumes in the library numbered 115,789. In 1917 there were productive funds amounting to \$2,473,451, the income from which was \$180,057. Bowdoin College was founded in 1794. President William DeWitt Hyde died on June 29, 1917; Dean Kenneth C. M. Sills of the College was acting-president in 1917.

**BOWELL, Sir MACKENZIE.** A Canadian statesman, died at Belleville, Ont., December 10, 1917, at the age of ninety-four. He was born in 1823 in Suffolk, England, but came to Canada in 1833, and in 1834 was apprenticed as a printer in the office of the *Belleville Intelligencer*, of which later he became editor and proprietor. He took a prominent part in local civic affairs and was elected to the Dominion Parliament for North Hastings in 1867, serving in that body until 1892, for part of that period as a member of the Privy Council and as Minister of Customs. In 1892 he was appointed Minister of Militia and Defense in the Conservative administration, and from 1894 to 1896 he was Premier of Canada. Later he was leader of the Conservative Opposition in the Dominion Senate (1896-1906). He represented the Senate at the coronation of King George V in 1911. Sir Mackenzie was a prominent Orangeman and had held high offices in that society. His editorial work on the *Belleville Intelligencer* was continued until a short time before his death.

**BOWLING.** The seventeenth annual tournament of the American Bowling Congress was held at Grand Rapids, Michigan, in March. Otto Kallusch, of Rochester, won the individual championship with a score of 698. Archie Rodee, of Milwaukee, was second, one point behind Kallusch. The winners in the other events were: Two-man, Satorious and Holzschuh, of Peoria, Ill., 1346; five-man, Birk Brothers, Windy City League, 3061. Birk Brothers also had the distinction of setting a new world mark for five-man teams, one game of 1102 and for three games of 3061. The Eastern Intercollegiate championship was won by the Renasselaer Polytechnic Institute of Troy, N. Y., in the roll-off of a tie with teams from Yale and Princeton universities.

**BOXING.** Three world titles changed hands in boxing during 1917. Benny Leonard wrested the lightweight championship from Freddie Welsh; Pete Herman defeated Jimmy Williams for the bantamweight laurels and Mike O'Dowd overthrew Al McCoy in a bout for the middleweight crown. The most sensational of these

upsets was the victory secured by Leonard over Welsh, the former knocking out the latter before a crowded house at the Manhattan Casino, New York City, on May 28.

The champions who retained their titles during the year were Jess Willard, heavyweight; Billy Miske, light heavyweight; Ted Lewis, welterweight; Johnny Kilbane, featherweight; and Jimmy Wilde, flyweight. Willard did not defend his championship despite the large number of challenges he was confronted with. It should be said in his defense, however, that none of the aspirants save perhaps Fred Fulton were of a strong enough type to have any hopes of being returned the victor.

The repeal of the Frawley Law by the New York State Legislature dealt a severe blow to the sport in the metropolis where it had attained its greatest popularity. The repeal was due to the stand taken by Governor Whitman who was dissatisfied with the conduct of the sport both on the part of the State Commission he himself had appointed and the promoters whose methods brought boxing into disrepute. A vigorous campaign was inaugurated in the latter part of 1917 to have a new law enacted, which by remedying the defects of the old measure should restore the sport to its former prestige and privileges.

Three boxers of note died during the year. They were Robert Fitzsimmons, one of the greatest fighters of all time; Les Darcy, the Australian middleweight who came to the United States seeking the world title after having defeated every contender in his own country, and Al Palzer, a boxer of less prominence.

The championships of the Amateur Athletic Union were held at Boston, Mass., in April. The results of the final bouts were: 108-pound class, Thomas Fall, Lowell, Mass., defeated Freddie Madden, East Boston, three rounds; 115-pound class, J. Tomasulo, Elizabeth, N. J., defeated Dan Looney, Cambridge, Mass., three rounds; 125-pound class, Earl Baird, Seattle, Washington, defeated Charles Beachler, New York City, three rounds; 135-pound class, Tommy Murphy, Kansas City, Mo., defeated James Sullivan, New York City, three rounds; 145-pound class, Daniel O'Connor, Dorchester, Mass., defeated Andrew O'Boyle, New York City, three rounds; 158-pound class, Eugene Brosseau, Montreal, defeated S. Lagonis, New York City, three rounds; 175-pound class, Ted Jamieson, Milwaukee, Wis., defeated John Gaddi, New York City, three rounds; heavyweight class, John Gaddi, New York City, defeated Joseph Burke, Toronto, Canada, two rounds, bout stopped by referee.

**BOY SCOUTS OF AMERICA.** The Boy Scouts of America form part of the world brotherhood of scouts several million strong. On February 8, 1918, the eighth anniversary of the incorporation of the Boy Scouts of America, there were 299,033 scouts properly registered in 13,886 troops, with 79,350 men council members and troop committeemen and scoutmasters. The ideals of the movement are efficient citizenship, service, and character building. "The Boy Scouts of America," the name under which the movement in the United States was incorporated on February 8, 1910, has as its honorary president, Woodrow Wilson, and as honorary vice-presidents, William H. Taft and Theodore Roosevelt. The active president is Colin H. Liv-

ingstone; the national scout commissioner, Daniel C. Beard; the treasurer, George D. Pratt; the chief scout executive, James E. West. A group of men brought together as a local council for the promotion of scout work receive a charter from the national organization. In many cases this council engages a scout executive to be leader of the scoutmasters in its district. The Scouts are organized in patrols and troops. Eight boys constitute a patrol, one being chosen as the patrol leader. Three or four patrols make up a troop. The scoutmaster is the adult leader of the troop. Any boy of any class or creed, over 12 years of age, is eligible to become a Scout. The initial requirements are that he take the Scout oath and honor the Scout law and know the significance of the badge and pass tests in the history of the flag and in knot tying. He is then a tenderfoot Scout. By meeting certain requirements he is in line to become a second-class Scout and first-class Scout. Scoutcraft includes instruction in first aid, life saving, tracking, signaling, cycling, nature study, seamanship, campercraft, woodcraft, chivalry, and all the handicrafts. It is a prime purpose of the Boy Scout Movement, abroad as well as in the United States, to teach boys that to create is better than to destroy. Splendid first aid and other humanitarian services have been rendered by the scouts in the present European war.

In the United States the Scouts have assisted in Liberty Loan and War Saving Stamp sales, in gardening and food conservation, as dispatch bearers for the government in distributing pamphlets for the Committee on Public Information, and have aided in the Red Cross, the Y. M. C. A., and other war service campaigns.

**BRADY, JAMES BUCHANAN.** An American capitalist, died in Atlantic City, N. J., April 13, 1917. He was born in New York in 1856, and after a public school education began life as a messenger boy in the offices of the New York Central Railroad. As a salesman for a machinery manufacturing firm he made a successful start in business and eventually he became an officer in a number of concerns, especially those manufacturing railroad cars and appliances. Business ability, for which he was less known than for his eccentricities, enabled him to build up a fortune of some millions. His fondness for jewels, particularly diamonds, and for the night life of New York kept him in the public eye. He was known popularly as "Diamond Jim" Brady, and always appeared, even by day, in an extraordinary array of precious stones. These were not always confined to his own person. He went so far as to equip his dog with sun-glasses set with rose diamonds and costing \$6500. In 1912, after Mr. Brady had been treated at Johns Hopkins Hospital for a digestive disorder that threatened his life, he gave \$200,000 to the institution to found the Brady Urological Clinic, with assurances of an annual \$15,000 for maintenance. He also left it \$300,000 in his will. Other bequests included jewelry valued at about \$1,000,000 to friends, besides \$150,000 in money, \$50,000 to charities, and his residuary estate, valued at some \$4,000,000 to New York Hospital to establish the James B. Brady Urology Foundation. Some of the most important railroad and business men in the country were among Mr. Brady's friends.

**BRAZIL, UNITED STATES OF.** A federal re-

public and by far the largest country of South America. The capital and largest city is Rio de Janeiro. The greater part of the country is undeveloped and much of it practically unknown to white men, but the natural resources throughout vast tracts are unquestionably immense. Energy and proper financial methods in the exploitation of the mineral deposits and, more particularly, in the development of agriculture, should place Brazil among the most prosperous countries of the world. Conditions and prospects there are well defined in a volume published in 1917: *Brazil: To-day and To-morrow* by L. E. Elliott.

**AREA AND POPULATION.** Estimates of area vary, but are near enough to permit the statement that Brazil covers almost 3,300,000 square miles. The planimetric calculation of the Brazilian ministry of agriculture shows perhaps the best tentative figure, 8,497,540 square kilometres (3,280,900 square miles). This area exceeds the area of Continental United States (without Alaska) by over 254,000 square miles. Our idea of the magnitude of Brazil's territorial extent may be further defined by noting that the 254,000 square miles is about equivalent to the combined areas of California and Oregon. Brazil consists of twenty states, the Federal District, and one territory. The population is supposed to be about 24,000,000. An estimate of about 26,500,000, relating to the year 1915, may be regarded as excessive. The census of 1890 returned a population of 14,333,915, and that of 1900 17,318,556. Little reliance can be placed upon published figures for the population of Brazilian cities. One estimate appearing in 1917 for Rio de Janeiro was 1,500,000, but this figure must not be taken seriously. The results of an official Brazilian calculation gave Rio 944,917 inhabitants on November 30, 1916; while an estimate of the Brazilian health department gave the city a population of 933,355 on January 31, 1917. It appeared from the report that the latter estimate comprehended the entire Federal District. The following figures for other cities are quoted from a pamphlet published by the Pan American Union in 1917: São Paulo, 400,000; São Salvador (Bahia), 280,000; Recife (Pernambuco), 250,000; Belém (Pará), 200,000; Porto Alegre, 150,000; Manaus, 60,000; Fortaleza (Ceará), 50,000; Bello Horizonte, 50,000; Curitiba, 50,000; São Luiz (Maranhão), 50,000; Therizina, 50,000; Nitheroy, 50,000; Maceió, 40,000; Florianopolis, 30,000; Aracaju, 30,000; Cuyabá, 20,000; Victoria, 20,000; Parahyba, 20,000; Natal, 20,000; Goyaz, 18,000. Estimated population of Santos, 35,000.

Recorded immigration to Brazil from 1820 to the end of 1915 is 3,363,456. This number includes 1,361,266 Italians, 976,386 Portuguese, 468,583 Spaniards, 122,830 Germans, 103,683 Russians, 78,545 Austrians and Hungarians, 52,434 Syrians, etc., 28,072 French, 22,005 British, 15,608 Japanese, and 10,713 Swiss. Immigration has been retarded by the great war. The number of immigrants in 1913 was 192,684; in 1914, 82,572; in 1915, 30,287. Of the latter number, there were 15,118 Portuguese, 6895 Spaniards, 5779 Italians, 640 Russians (mostly Poles), and 514 Syrians.

**EDUCATION.** Illiteracy prevails, but education is encouraged and supported by both Federal and state governments. Elementary instruction

is free, secular, and in some states nominally compulsory. Schools of all kinds are reported to number about 13,000, with an enrollment of about 750,000. There are a number of secondary, normal, special, and technical schools, while agricultural instruction is encouraged by all of the state governments. Brazil has no university, but there are 25 faculties which confer degrees. Among the law faculties should be mentioned those of Recife, São Salvador, and São Paulo; the medical schools of São Salvador and Rio de Janeiro are well known, and also the mining school at Ouro Preto. The people (except the uncivilized aboriginals) are almost wholly Roman Catholic, but church and state are separate, and the exercise of all religious forms is permitted. The language of Brazil is Portuguese.

**PRODUCTION.** The chief commercial product is coffee. Among other products of great importance are rubber, leather, cacao, yerba maté, tobacco, and sugar. In addition to these products should be mentioned rice, cotton, corn, manioc, bananas and other fruits, beans, and Brazil nuts. Brazil produces about four-fifths of the world's coffee, and the state of São Paulo over one-half. The principal coffee-producing states besides São Paulo are Rio de Janeiro, Espírito Santo, and Minas Geraes. The average annual production is upwards of 12,000,000 sacks (one sack = 60 kilograms = 132.377 pounds). Rubber is gathered in the forests of the Amazon basin, but the cultivation of the rubber tree is encouraged by the government. Cacao, in the production of which Brazil leads the world, is grown especially in the state of Bahia; sugar cane is produced chiefly in Pernambuco and other parts of the northeast; maté, chiefly in Paraná; cotton, largely in the northeast; tobacco, in Bahia and Rio Grande do Sul.

The live stock census of 1913 showed horses to the number of about 7,289,000, valued at \$54,667,500; mules and asses, 3,208,000, \$40,100,000; cattle, 30,705,000, \$383,812,500; sheep, 10,653,000, \$13,063,250; goats, 10,049,000, \$12,561,250; swine, 18,399,000, \$91,995,000; total value, \$596,199,500. Since 1914 the frozen-meat industry has shown a notably increasing importance.

Parts of Brazil, especially Minas Geraes, are rich in minerals; but mining, in general, has not attained a satisfactory development. Brazil produces the greater part of the world's supply of monazite, but from 1913 to 1915 the export of monazite sand fell from 1437 metric tons to 439 tons. The output of manganese ore shows rapid increase, the export in 1915 being 288,671 metric tons; returns for a portion of 1916 show a much larger amount. The manganese ore goes largely to the United States, affording about four-fifths of the American supply. There is some mining of gold, gems, and a few other minerals.

Brazil's leading manufacture, that of cotton goods, has developed in the last twenty-five years so that now all but the finer grades are produced. Other manufactures of importance are flour, woolen goods, and beer.

**COMMERCE.** The following table shows the value of imports and exports in contos (that is, thousands of milreis) gold. The milreis is valued at 54.62 cents, and the conto accordingly at \$546.20.

	1912	1913	1914	1915	1916
Imports ..	562,775	597,034	315,312	267,452	358,839
Exports ..	663,548	576,433	413,571	470,847	488,980

In thousands of American dollars, the trade is represented as follows:

	1912	1913	1914	1915	1916
Imports ..	307,934	326,100	172,224	146,082	195,998
Exports ..	362,430	314,848	225,892	257,177	267,081

Classified import values are shown below. The class "raw materials" includes "materials used in the arts and industries," as vegetable oils, materials for paints, etc. Values are given in contos.

	1913	1914	1915	1916
Live animals...	3,171	1,322	381	938
Raw materials...	125,004	65,393	70,528	106,216
Manufactures ..	334,980	152,817	95,949	152,063
Food and drink	133,880	95,782	100,594	99,622
Total.....	597,034	315,312	267,452	358,839

The leading articles imported include machinery and other iron and steel manufactures, railway materials, cotton fabrics, coal, flour, codfish, wine, arms, and ammunition, kerosene, and paper.

Exports are divided into three major classifications as shown below. Values are in contos.

	1913	1914	1915	1916
Animals and animal products..	29,613	28,114	37,819	56,290
Minerals and mineral products..	6,276	7,076	10,431	19,120
Vegetable products .....	540,544	383,381	422,598	413,570
Total.....	576,433	413,571	470,847	488,980

The reported export of coffee in 1913 amounted to 13,267,449 sacks of 60 kilos each (of which 4,914,730 to the United States); in 1914, 11,269,724 (5,532,081); in 1915, 17,061,319; in 1916, 13,039,000. Of the 1915 export, the United States took 7,194,594 sacks; France, 2,449,222; Sweden, 2,333,386; Netherlands, 1,486,994; Italy, 710,800; United Kingdom, 413,786. The exportation to Austria-Hungary decreased from 1,016,824 sacks in 1913 to 363,932 in 1914 and was nothing in 1915; that to Germany decreased from 1,865,632 sacks in 1913 to 656,369 in 1914 and was nothing in 1915. Another effect of the great war should be noted in this connection, namely, the increase of the coffee export to Sweden. The reported amount sent to Sweden was 212,034 sacks in 1913, 487,002 in 1914, and 2,333,386 in 1915.

Leading articles of export, besides coffee, are shown in the following table, in metric tons:

	1913	1914	1915	1916
Rubber .....	36,232	33,581	35,165	31,495
Cacao .....	29,759	40,767	44,980	42,720
Leather .....	31,442	38,324	38,324	46,390
Yerba maté....	65,415	59,554	75,885	73,552
Tobacco .....	29,338	26,980	27,098	21,293
Sugar .....	5,367	31,660	59,074	53,824
Cotton .....	.....	30,434	5,228	1,071
Manganese ore	122,300	183,630	288,671	503,130

In 1916 the export of Brazil nuts amounted to 197,647 hectoliters; beans, 45,594 metric tons; cottonseed, 11,762 tons; carnauba wax, 4167 tons; piassava nuts, 3561 tons; bananas, 2,980,271 bunches.

Imports by principal countries, in thousands of dollars:

	1913	1914	1915	1916
United States.....	51,238	30,213	46,858	76,908
United Kingdom...	79,801	40,958	82,029	89,962
Argentina.....	24,269	16,570	23,237	27,555
France.....	31,908	13,436	7,217	10,173
Portugal.....	14,313	8,785	7,236	9,088
Italy.....	12,353	7,083	6,443	6,849
Newfoundland.....	3,821	8,462	8,113	3,856
British India.....	2,677	1,832	2,722	3,164

**COMMUNICATIONS.** Brazilian railways have been constructed chiefly to serve the settled seaports, penetrating the producing agricultural areas inland. The building of coastwise lines from town to town was undertaken later and this construction is comparatively small; in fact, it has not been greatly needed with the maintenance of good shipping service. Brazilian railways have been criticized for lack of coherence, but no other plan of construction could have well been followed. The reported length of railway in operation at the end of 1915 was 16,331 miles (26,282 kilometres). A monograph published by the Pan American Union in 1917 states that the "total extent of railways in

Brazil is 14,596 miles." This figure perhaps relates to length of line rather than to length of track. The total is made up as follows: Federal lines, 2194 miles; private lines, 3232; leased lines, 5386; state lines, 3782; total, 14,596.

In 1917 there were a number of important railway developments in Brazil, which country was wide awake to the necessity of opening up the interior and developing its vast resources. In February, 1917, contracts entered into by the Brazilian government and the Brazil Northern Railway for the construction of the Tocantins Railway, were revised and during the year the company endeavored to open to traffic the second section from Alcobaca, sixty-five miles further. The first section from Cameta to Alcobaca, and the third section which extended from the second to Chambioaz, were to be built within six months from a date set by the government, while a branch line from Chambioaz to Santa Maria and the Tocantins was to be commenced six months after the completion of the third section. The Tocantins Railway, being near the coast and in a reasonably healthy country, did not present the usual difficulties of tropical engineering. An interesting concession made on August 16, namely to Alberto Alvarez de Azevedo de Castro of Rio de Janeiro for a line between the city of Cuyaba, the capital of Matto Grosso, to communicate with the Araraquara Railway, and thus afford direct communication between Cuyaba and the ports of Rio and Santos, continued under discussion in 1917. The length of the proposed extension was about 620 miles, and during the life of the concession, sixty years, no other line was to be built within the zone of twelve miles of each side of the roadbed, although branch lines for private use were permitted. Plans for the first section of sixty-two miles were to be submitted to the government before June 30, 1919, and construction was to be begun within one year from the date of approval. The new line was to be of metre-gauge (3.28 feet).

**FINANCE.** Brazil's monetary unit is the milreis, equivalent to 54.62 cents. Currency is government paper. The paper milreis has a par value of 32.444 cents, but its actual value fluctuates, being in 1917 about 25 cents. The "conto" is 1000 milreis, the conto gold being worth \$546.20, and the conto paper about \$250. Estimated revenue for 1916: 110,682 contos gold, 349,166 contos paper; estimated expenditure, 84,365 contos gold, 405,266 contos paper. Estimated revenue for 1917: 128,335 contos gold, 340,138 contos paper; estimated expenditure, 98,533 contos gold, 407,427 contos paper. Chief estimated receipts in 1917: import duties, etc., 70,400 contos gold, 57,000 contos paper; consumption taxes, 102,488 paper; national property and industries, 4292 gold, 100,182 paper. The largest departmental expenditures as estimated for 1917 were: finance, 73,653 contos gold, 123,875 contos paper; transportation and public works, 22,125 gold, 120,538 paper; war, 50 gold, 64,265 paper; marine, 180 gold, 36,817 paper. Public debt as reported for December 31, 1916: foreign, \$112,332,968; internal, 864,436 contos paper; floating (March 31, 1916), 252,183 contos paper. Paper money in circulation in 1916, over 1,100,000,000 milreis.

**NAVY.** The only large, formidable vessels in the Brazilian navy are the dreadnoughts *Minas*

*Geraca* and *São Paulo*, the one completed in 1908 and the other in 1909. Each has a displacement of about 19,250 tons, a 9-inch armor belt, a main battery of 12 12-inch guns, and a nominal speed of 21 knots. The coast guards *Deodoro* (1898) and *Floriano* (1899) have each a displacement of about 3150 tons, a 14-inch armor belt, 2 12-inch and 4 4.7-inch guns, and a nominal speed of 14 knots. The scout cruisers *Bahia* (1909) and *Rio Grande do Sul* (1909) have each a displacement of about 3100 tons; their principal armament is 10 4.7-inch guns. The old protected cruiser *Barroso* (1896) displaces 3450 tons and carries 6 8-inch and 4 4.7-inch guns. There are also several torpedo cruisers, torpedo boat destroyers, torpedo boats, river gunboats, 3 submarines, etc. The complement is reported to be over 13,000 men.

**GOVERNMENT.** The legislative power is exercised by a congress of two houses, the Senate and the Chamber of Deputies. It consists of 63 members, 3 for each state, and the Federal District; they are elected for nine years by direct vote. The chamber consists of 212 deputies, who serve for three years. The executive authority is vested in a president elected for four years by direct vote and ineligible for the next term. He is assisted by a cabinet of seven members. The president in 1917 was Wenceslão Braz Pereira Gomes, inaugurated November 15, 1914, in succession to Marshal Hermes da Fonseca; vice-president, Urbano dos Santos da Costa Araújo.

The Brazilian states have elective governors and legislatures and enjoy a large degree of autonomy. The Federal District, containing Rio de Janeiro, is administered by a prefect, who is appointed for four years by the president, and by a council, elected by the voters of the district.

**HISTORY.** The movement against Brazilian neutrality continued in the beginning of the year and was intensified by the German submarine policy. On February 8 the government warned Germany that it did not consider the submarine blockade effective and would hold Germany responsible for any damage to Brazilian merchant vessels in violation of International law. The same note was sent to Austria. The warning to Germany was renewed a week later. The German government declared its intention of pursuing its submarine policy, but suggested diplomatic negotiations on the subject of such sinkings as might occur. After the sinking of the *Parana* by a German submarine which was reported early in April the Brazilian government handed his passports to the German minister (April 10) and a note was addressed to the press to the effect that from the inquiry into the torpedoing of the *Parana* it was established that she had received no summons to stop, that she was torpedoed by the submarine and shelled five times, and that no assistance had been rendered to the crew. In view of these circumstances and of the previous offenses of which complaints had been made to the German government the government of Brazil broke off relations with Germany. German vessels in Brazilian waters, forty-six in number, were subsequently seized. There was a strong movement for a declaration of war, and after Señor Nulo Pecanha, who was strongly pro-Entente, had succeeded Dr. Lauro Muller in the foreign office on May 5, the drift toward war became more rapid. On May 29 the Chamber of Deputies

authorized the president to revoke the proclamation of neutrality when in his opinion the time had come for a declaration of war. Meanwhile, many anti-German demonstrations had been reported, notably at Porto Alegre, where Germans were said to have tried to blow up bridges. Toward the latter part of May it was learned that the Brazilian vessel *Tijuca* had been sunk off Brittany. Thereupon, on May 24, the Minister of Foreign Affairs presented to Congress a message signed by President Braz, saying that the sinking of Brazilian merchant vessels by the Germans made it necessary for the government to take defensive measures against the submarine warfare. The message further suggested the seizure for the present but not the confiscation of German vessels interned in Brazilian ports. It explained that the Brazilian government had been obliged to oppose the policy of Germany in the matter of a submarine blockade of neutrals. It had protested against this policy at the time and after the sinking of the Brazilian steamer *Parana* it had broken off diplomatic relations with Germany. Now came the news of the sinking of a second steamer without warning. The government must therefore take some definite action. He recommended the revocation of the neutrality proclamation. The Chamber passed the revocation of neutrality a few days later (May 28). See WAR OF THE NATIONS, *Diplomacy of the War*.

On January 1, 1917, a new civil code went into effect.

**BREAD.** See FOOD AND NUTRITION.

**BREAD ORDER.** See FOOD CONTROL.

**BREEDING.** See STOCK RAISING AND MEAT PRODUCTION.

**BRETHREN, CHURCH OF THE.** A religious denomination known also as the Dunkers or Dunkards. There are three branches: the Conservatives, the Progressives, and the Old Order. There are also the Seventh Day German Brethren, numbering in 1917 about 300 communicants, 15 churches, and 6 ministers. The Conservatives, the largest branch, numbered in 1917 about 100,000 communicants, about 1000 churches, and 3172 ministers. The Progressives had in 1917 about 24,000 communicants, 210 churches, and 300 ministers. The Old Order had about 3500 communicants, 70 churches, and 216 ministers. The Conservative group maintained 10 schools, of which the Bethany Bible School at Chicago was devoted entirely to study in the Bible. The Sunday schools of the Conservative group in 1917 numbered 1252, with 12,698 officers and teachers, and 130,891 scholars. It had a publishing house at Elgin, Ill., where a large number of books and papers were issued. It had missions in Sweden and Denmark, India, and China. The Progressives had a publishing house at Ashland, Ohio.

**BREWING.** See LIQUOR REGULATION; LIQUORS.

**BRIDGES.** In bridge construction the year 1917 was marked by the completion of three notable structures, namely, the bridges at Quebec, Sciotoville, and Metropolis, which gave to America the greatest of each type of steel bridge that so far had been developed. The superiority in every branch of steel bridge work that thus had been achieved by American engineers was the result of careful and original design, coupled with systematic experiment and

test, and the utilization of metallurgical developments and construction and other experience. Thus, the Quebec Bridge, with its interesting and dramatic history, in 1917 ranked at the head of the world's cantilever spans, exceeding by some 100 feet the famous Forth Bridge, which for thirty years had stood unchallenged among the important bridges of the world. In simple truss construction, the Metropolis bridge described in the YEAR BOOK for 1916 marked the culmination of a type characteristically American, in which steady progress also had been made. The long-span, pin-connected construction as shown in the Metropolis bridge was a logical development of the work of American engineers for over half a century. Among the long-span continuous bridges in which old ideas had been developed and utilized, the Sciotoville marks an achievement in still another field. These three bridges, together with the great East River suspension bridges, clearly indicated the supremacy of American construction, which is also maintained as regards steel viaducts, bascules, lift bridges, and swing bridges.

**QUEBEC BRIDGE.** On September 20, 1917, the 640-foot suspended span of the great Quebec Bridge across the St. Lawrence was successfully hung on the cantilevers, and bolted into its final position. This bridge is not only the greatest of cantilevers, but also has the greatest clear span and its construction has been attended by various remarkable features, referred to from time to time in the YEAR BOOK, especially in the issues for 1907 and 1916.

On August 29, 1907, the south half of the structure, while in course of erection, crumpled under its own weight, causing a great loss of life. This accident led to the development of a new truss design, and its fabrication was attained by shopwork of high precision and finish. The later design represented the best features of comparative bridge building, and the general scheme of erection was developed in a courageous way. Unfortunately, on September 11, 1916, while the suspended span, connecting the two cantilevers, was being hoisted into position, a failure occurred, and the entire structure fell to the bottom of the river. In 1917, however, the work was attended with every success, and the greatest single fabricated part of a structure to be placed in position was assembled, floated  $3\frac{1}{2}$  miles on scows, and then hoisted 150 feet by hydraulic jacks and lifting chains. The new span duplicated the former construction, being 640 feet in length, 88 feet in width, and weighing 5400 tons. About 75 per cent of the steel was nickel alloy, and it was rolled, cut, and assembled on false-work in  $10\frac{1}{2}$  months. The same site at Sillery Cove,  $3\frac{1}{2}$  miles down the river, was employed, as well as the same false-work and end supports, on which the span had been erected in the previous year. Even the same six scows before used for floating were also employed. The essential difference in the 1917 arrangement over that of the previous year was a new arrangement of the girders, and the rebuilding of the bearings used between the chains and the span corners.

Early on the morning of Monday, September 17, 1917, the scows bearing the structure were floated out into the river, and about 9 o'clock the lifting chains began to take up the load, and the upward journey of 150 feet was begun. By means of hydraulic jacks, 75 successive lifts

were made, and at the end of the seventy-fifth stroke, at 3.25 in the afternoon of Thursday, September 20, the first of the eight pins connecting the eye-bars was driven, and by 4 o'clock all of the pins were in position, and the great work was accomplished. The jacks were then lowered to release the lifting gear, and the erection equipment was dismantled. The pin-and-socket wind-stress connections between the span and the cantilever were brought forward, and everything was arranged for completing the work. This included the erection of the span floor system, the laying of the footwalks, and the riveting of the lateral-bracing connections. By December 31 the structure was practically completed.

The Board of Engineers of the Quebec Bridge, representing the Dominion government, were C. N. Monsarrat, chief engineer and chairman, Ralph Modjeski, and H. P. Borden. The bridge was built by the St. Lawrence Bridge Company, under the general direction of G. H. Duggan, chief engineer, G. F. Porter, engineer of construction, and S. P. Mitchell, consulting engineer of erection. The actual lifting operations were in charge of W. B. Fortune, erection superintendent of the St. Lawrence Bridge Company. The design, construction, and erection of the Quebec Bridge figured extensively in current engineering literature, and a final discussion of the placing of the suspended span is well summarized in the *Engineering-News Record* (New York) for September 27, 1917.

**SCIOTOVILLE BRIDGE.** During the year the Sciotoville continuous truss bridge with its two 775-ft. spans was completed. The Ohio span of this bridge was erected on false-work and was completed late in January. The Kentucky span involved cantilever construction with temporary supports, a creeper traveler moving along the top chord being used to carry the work forward. This work developed without structural accident of any kind, and as fast as the material was placed it was riveted.

**MANAYUNK BRIDGE.** A notable concrete arch bridge across the Schuylkill River on a reverse curve was built during the year by the Pennsylvania Railroad, replacing the old bridge which had become too light for traffic requirements. The total length of the new structure was approximately 1200 feet, and it comprised at the north approach a steel through girder span followed by a massive pier of 40 ft. length, two 105-ft. spans, a 120-ft. span, three main 150-ft. spans over the river, one 120-ft. span and finally a small terminal pier and a deck-plate girder approach viaduct. The rise of each arch was one-third the span length, except the 105-ft. span which had a rise of 30 feet. The concrete construction was adopted in order to secure a pleasing architectural appearance as well as on account of the high cost of steel.

**ST. LOUIS BRIDGE.** The last girder of the three-mile east approach of the St. Louis Municipal Bridge over the Mississippi at East St. Louis, Ill., was placed on May 1, 1917, so that only the timber deck and tracks completing the railway section remained. The higher section of the bridge and approach had been formally opened on January 20.

**JAMES RIVER BRIDGE.** On January 25, 1917, competitive bids were received for a concrete arch viaduct and a steel viaduct for a bridge over the James River at Richmond, Virginia.

The cost of the concrete arch was \$477,774 as compared with \$492,435 for the steel viaduct, which involved a plate girder and steel tower construction on concrete pedestals. The contract was awarded for the concrete arch bridge, the construction of which was begun during the year. It was to be a bridge 32 ft. 6 in. wide and 2278 ft. long including abutments. The base of the rail was at elevation 100 above the river level and there were 12 arches of 116 ft. clear span and 58 ft. rise. Three arches of 122 ft. clear span and 58 ft. rise, three of 60 ft. clear span and 30 ft. rise, and 70 ft. of abutment approaches. The main-span piers were 14 ft. thick at springings and with an abutment pier of 20 ft. in thickness for each group of three arches. The abutment and 60 ft. arches had solid earth-filled spandrels while the main arches were of open spandrel designed with slab floor system. This bridge is discussed in the *Engineering News-Record* for July 12, 1917.

**MARKET STREET BRIDGE, CHATTANOOGA.** The Market Street Bridge at Chattanooga, Tenn., a 300-ft. double-leaf rolling-lift and bascule span completed in 1917 and formally opened on November 17, was notable for some novel features of erection. This bridge was about 2300 ft. in length, including the approach fills, and had five reinforced concrete arches of 180-ft. span and two of 165-ft. besides nine 40-ft. concrete slab spans, in addition, of course, to the 300-ft. steel drawspan. This drawspan was erected as a cantilever in a closed position, one leaf being erected complete in the first place and the same equipment and method was followed with the south leaf.

**SAN FRANCISCO BRIDGE AND TUNNEL.** Various plans for bridges and tunnels across San Francisco Bay had been put forward in the past, and in 1917 a new plan for a combination bridge and tunnel between Oakland mole and Folsom Street pier, San Francisco, was proposed. The bridge was to be built close to the water on each side of the bay with appropriate wharves and piers for ships to dock, and where a tunnel arrangement in the centre would provide a clear channel 3000 ft. wide and would consist of three tubes, two for electric trains, and one for vehicular traffic. The roadways would enter the tunnel from the bridge at points to be marked by lighthouses. The distance from the water line to the top of the tubes was to be approximately 45 ft. The estimated cost of the project was \$28,000,000.

**PROPOSED BRIDGE AT NEW YORK.** In the annual report of the Department of Plant and Structures of the City of New York for 1916 which was published in 1917, there was proposed a new bridge structure across the East River from First Avenue and 125th Street, Manhattan, to Second and Potter aves. in Queens with a branch connecting the Bronx at St. Ann's Ave. and Southern Boulevard. The proposed bridge was to be located alongside of the Hell Gate arch and would be approximately 15,000 ft. long. The construction suggested was a large cantilever steel span in the Hell Gate channel, while for the approaches in Queens and on Ward's and Randall's Islands, including the crossing at Little Hell Gate, reinforced-concrete would be used. A lift span would be employed in the Manhattan connection extending from Randall's Island to First Avenue, and by

the use of inclined approaches at Randall's and Ward's Islands, these points would be given direct vehicular communication with the mainland. The estimated cost of the entire structure at normal prices for materials and labor would be about \$10,500,000. No action was taken on this by the city authorities.

**MISSOURI RIVER BRIDGE MOVING.** At St. Joseph, Missouri, an interesting accomplishment was the movement of three 297-ft. 1000-ton truss spans of the Missouri River bridge 136 ft. 9 in. to new piers which took place on November 14. These piers were built between the old ones and the spans were moved longitudinally to the new supports. A standard gauge railway track was constructed on false work under each truss and heavy railway car trucks on each of which a 300-ton hydraulic jack was mounted, were employed. Twelve power trucks were used with each span with two idler trucks at the middle. The 3000-ton load was moved in 13 minutes. This interesting work was fully discussed in *Engineering News-Record* for October 25, 1917.

**A NEW NIAGARA BRIDGE.** To replace the Niagara cantilever bridge of the Michigan Central R. R. at Niagara Falls, N. Y., a steel arch of about 560-ft. span with a rise of about 132 ft. from the hinges to the bottom chord was planned during 1917, although no time was set for the construction in view of war conditions. The new steel arch bridge was to carry three tracks and was to take the place of the former arch, famous as being the first cantilever bridge to be built in the United States.

**EUROPEAN WORK.** In Europe, the attention of bridge engineers was in large part occupied by military construction and destruction. The French engineers in particular were active in rebuilding the various structures destroyed by the Germans, and masonry arches were replaced by concrete in many cases, where timber and cut stone were scarce. In some cases, it was possible to rebuild 60-ft. masonry arches by the use of old iron in the form of old steel rails with a minimum of timber. In other cases, girder bridges were rapidly installed in connection with the railway reconstruction and the facilities for communication were increased.

**WILLAMETTE RUN BRIDGE.** During the year plans were being prepared for a steel bridge across the Willamette River at Salem, Oregon, and after the matter had been in discussion and controversy for more than three years a new project was to have a 24-ft. roadway and a 5-ft. sidewalk on either side and involved about 650 tons of steel, 100 ft. of reinforced-concrete approach, 250 ft. of fill approach, and 750 ft. of first-class wooden approach.

**STUBENVILLE, OHIO, BRIDGE.** A single track steel bridge 1120 ft. and 110 ft. deep over the main piers across the Ohio River at Steubenville, Ohio, exhibited some new developments in bridge erection methods. This new cantilever bridge connected the by-products coke plant on the West Virginia side of the river and the furnaces and mills of the Labelle Iron Works on the Ohio side. It consisted of a cantilever made up of two anchor arms of 230 ft. each, two cantilever arms of 180 ft. each, and a suspended span of 300 ft., the distance from centre to centre of tower piers being 680 ft. The weight of steel exclusive of approaches is 4088 tons. The erection of this bridge was accom-

plished exclusively by locomotive trains equipped with booms and operated from each end of the bridge, the design being made with the proposed plan of erection in view. The final adjustment incidental to swinging the suspended span was accomplished by the use of hydraulic jacks instead of the use of wedges and screws.

**A LONG PLATE GIRDER.** A plate girder bridge with a girder 131½ ft. long over all, 10 ft. deep and weighing 105 tons was set in place November 11 by the New York Central Railroad on the West Shore tracks near New Durham, N. J., at the crossing of the Northern Railroad of N. J.

This new girder was erected by two large wrecking cranes, one of 150-ton capacity and the other of 120-tons. The long girder was substantially normal except for its size. The web was 120 inches deep and the top flange was of four-angle section but the bottom flange had only the usual pair of flange angles and was fitted with six cover plates instead of five as on the top flange. The web stiffeners were 7 by 3½ in. angles, the floor-beam connections 8 by 6 in. crimped over the flange angles between the flange side plates. The flange cover plates were each about 5 ft. longer than the theoretical length, the extra length being utilized to splice the cover plates lying below.

**THAMES RIVER BRIDGE.** In August, 1917, the construction of the piers and abutments of the new Thames River bridge at New London for the New York, New Haven and Hartford R. R. was completed. The westerly three piers were sunk by open dredging, the depth of the two adjacent to the channel being 130 ft. below water. The east pier was a pneumatic caisson pier with three circular caissons. The total cost of the work exceeded a million dollars. The new bridge will be formed of spans from west to east of 185 ft., 330 ft., 212 ft., 330 ft., and 330 ft. respectively. The 212-ft. span was to contain a bascule draw. Contracts had been awarded for the silicon steel which was to weigh about 5525 tons. The old Thames River bridge, which was to be turned over to the State of Connecticut for highway use, contained 503 ft. swing span and at the time of its construction in 1889, it was the longest swing span in existence.

**BRITISH ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE.** See **ADVANCEMENT OF SCIENCE**. **BRITISH ASSOCIATION FOR THE**

**BRITISH COLUMBIA.** A province of Canada. It extends westward from Alberta to Alaska and the Pacific Ocean. The estimated area is 355,855 square miles. The 1911 census showed a population of 392,480, the increase over 1901 being 119.68 per cent. In 1911, the city of Vancouver had 100,401 inhabitants; Victoria, the capital, 31,660; New Westminster, 13,199; Nanaimo, 8306; Prince Rupert (now western terminus of the Grand Trunk Pacific Railway), 4184.

The province has a legislative assembly of one chamber; it consists of forty-seven members elected by direct vote for four years. The executive authority rests with a lieutenant governor, appointed by the governor-general of the Dominion; he acts through an executive council, or responsible ministry, of eight members. Lieutenant governor in 1917, Frank Stillman Barnard; premier, H. C. Brewster.

1917—5

**BRITISH EAST AFRICA.** That part of East Africa consisting of the Uganda Protectorate, the East Africa Protectorate, and the Zanzibar Protectorate. See these titles.

**BRITISH GUIANA.** A British colony on the northeast coast of the South American continent, extending from east to west about 270 miles, and from north to south about 540 miles. It includes the settlements of Demerara, Essequibo, and Berbice, and is bounded on the east by Dutch Guiana, from which it is divided by the Corentyn River, on the south by Brazil, on the west by Venezuela, and on the north and northeast by the Atlantic Ocean. Its area is about 90,277 square miles, extending from 0° to 1° N. lat., and from 57° to 61° W. long. About 130 square miles only are under cultivation.

**BRITISH HONDURAS.** A colony on the east coast of Central America, bounded on the north by Yucatan, on the west by a straight line drawn from the rapids of Gracias a Dios on the Sarstoon River to Garbutt's Falls on the Belize River, and thence due north to the Mexican frontier, on the south by Guatemala, and on the east by the bay of Honduras. It lies between 18° 29' and 15° 54' N. latitude and 89° 10' and 87° 50' W. longitude.

The area of the colony is 8598 square miles, including Albion Island in the Hondo River (about 26 square miles), and Ambergris, St. George's English, Turneffe and other Cays, 212 square miles, a large portion of the latter being mangrove swamps without any soil. It is estimated that about 80 square miles are under cultivation.

**BRITISH INDIA.** See **INDIA, BRITISH**.

**BRITISH NEW GUINEA.** See **PAPUA**.

**BRITISH NORTH BORNEO.** The territory under the jurisdiction of the British North Borneo Company (incorporated by Royal Charter under date of November 1, 1881), now known as "the state of North Borneo," comprehends the whole of the northern portion of the island of Borneo from the Sipitong River on the west to lat. 4° 10' N. on the east coast, together with adjacent islands; it is held under grants from the sultans of Brunei and Sulu, and contains an area of 31,000 square miles with a coast line of about 900 miles. It extends from 115° 20' to 119° 20' E. long., and from 4° 10' to 7° 25' N. lat. The southern boundary was settled by a convention at London June 20, 1891.

The principal stations of the company are at Sandakan, Lahad Datu, and Tawao on the east, Kudat on the north, and Jesselton on the west. At each of these there are excellent harbors, especially at the first named, which is situated in a magnificent bay some fifteen miles in length, with an average breadth of five miles. It is 1000 miles from Singapore, 1200 from Hong Kong, and 1600 from Port Darwin. The headquarters of the administration is at Jesselton. Inland stations are at Labuk, Kotabelud, Tuaran, Tambunan, Kaningau, Tenom, Beaufort, Pensiangan, Lamag, Papar, Putatan, and Ranau.

**BRITISH SOMALILAND.** See SOMALILAND PROTECTORATE.

**BRITISH SOUTH AFRICA.** See SOUTH AFRICA, UNION OF.

**BRITISH WEST AFRICA.** The following British colonies and protectorates in western Africa, regarded collectively: Nigeria, consisting of colony and protectorate; Gold Coast, consisting of Gold Coast colony, Ashanti, and the Northern Territories; Sierra Leone, consisting of colony and protectorate; Gambia, consisting of colony and protectorate. See these separate titles.

**BROOKE, Sir CHARLES JOHNSON, Rajah of Sarawak.** Ruler of a British protectorate on the northwest coast of Borneo, died at Cirencester, England, May 17, 1917. His name was originally Charles Anthony Johnson. Brooke was his mother's maiden name. He was born in 1829 at Benow Vicarage, Somerset, and became a midshipman in the navy at 12. In 1852 he resigned his naval commission to serve under his uncle, Sir James Brooke, the noted first Rajah of Sarawak, who after many years was still engaged in the task of bringing order to a country accustomed to piracy and head hunting. In 1857 came a crisis when Chinese pirates entered Kuching, the capital, and stormed the Rajah's palace. While his uncle escaped, by swimming a river at night, Charles Brooke rallied a few natives and annihilated the invaders.

After he became ruler, in 1868, on the death of the first Rajah, he acquired much new territory by purchase and voluntary submission of the people, and developed the country's trade in pepper and gold. Sarawak was originally 7000 square miles in extent; it is now 57,000 square miles. Although Sarawak was formally made a British protectorate in 1888, at which time Brooke was created G.C.M.G., the Rajah continued to be virtually absolute monarch, with a few hundred Europeans and some 500,000 natives as subjects, and 40,000 square miles of territory. Under him were British civil service officials and native chiefs. In 1904 Edward VII recognized the Rajah as a Prince of the East. In his old age Sir Charles lived mostly in England, at Cirencester, and in Italy, at a villa near Genoa. His son, Charles Vyner Brooke, had been his assistant since 1897 and had been the active head of the government (known as Rajah Mudah) for some time before his father's death made him actual ruler.

**BROOKLYN INSTITUTE OF ARTS AND SCIENCES.** An institution founded in 1824 and reincorporated in 1890. It consists of four departments; a Department of Education; Department of Museums, including the Brooklyn Museum and the Children's Museum; Depart-

ment of Botanic Garden; and Department of Biological Laboratory. The Department of Education, Charles D. Atkins, Director, offers addresses, lectures, courses of instruction, concerts and meetings. Many important men are secured as speakers and the best artists provide the concerts. Nominal fees are required as payment for the privileges. One important feature of the educational system of the Institute is a school of pedagogy. The Brooklyn Museum, William H. Fox, Director, is famous for its collections in three departments—art, ethnology, and natural science. Supplementing this work is that of the Children's Museum and Library. The Brooklyn Botanic Garden, Dr. C. Stuart Gager, Director, has developed rapidly during the few years of its existence, and in 1917 ranked among the leading Botanic Gardens of the country. The Biological Laboratory, Dr. Charles B. Davenport, Director, at Cold Spring Harbor, N. Y., founded in 1889 under Institute auspices, became a Department of the Institute in 1917. At the close of the year 1917, the entire membership in all Departments, was 9600. The total number of persons who took advantage of the varied departments of the Institute was 871,456 in 1916-17, as compared with 6900 in 1887-88. For the same years the receipts were respectively \$385,748.04 and \$4456.70 and the permanent funds \$942,400.51 and \$37,000. There are branches of the Institute at Jamaica and Huntington, Long Island. President of the Board of Trustees, A. Augustus Healy.

**BROWN UNIVERSITY.** An institution of higher learning, founded in 1764 and located at Providence, R. I. Students in the fall of 1917 numbered 916. There were 235,000 volumes in the library. The departments of Brown University include a Woman's College. President, William H. P. Faunce, D.D., LL.D.

**BRUSSILOF EXPEDITION.** See POLAR RESEARCH.

**BEYOE, LLOYD (STEPHENS).** An American diplomat, died in New York City, April 2, 1917. He was born in Flushing, Long Island, in 1851, and was brought up at Georgetown, D. C., where he attended the Jesuit College. After further preparation in New York, he entered Christ Church, Oxford, in 1869, took the B.A. and M.A. degrees, and returned to study law at Columbia University. His first important public office was that of postmaster general of New York State, with rank of brigadier-general, to which Governor Hill appointed him in 1886. From 1887 to 1889 he served in Congress as a Democrat. In the latter year Allen Thorndike Rice, one of the owners of the *North American Review*, bequeathed his interest in this periodical to General Bryce, who, after purchasing the remaining interests, conducted it till 1896. During this period, which was one of expansion for the *Review*, Gladstone, Bismarck, and other famous men on two continents contributed to its pages. In 1911 President Taft appointed General Bryce Minister to the Netherlands and Luxemburg. This post he retained till 1913. He furthered the building of the Peace Palace at the Hague and was a delegate to the Opium Conference of 1913 and honorary vice-president of the Conference on Bills of Exchange. He was the author of essays, articles, and of these novels: *Paradise*; *A Dream of Conquest*; *An Extraordinary Experience, or the Ro-*

*mance of an Alter Ego; Friends in Exile; and Lady Blanche's Salon.*

**BEYN MAWE COLLEGE.** A non-sectarian college for women founded in 1885 and located at Bryn Mawr, Pa. Students in the fall of 1917 numbered 484 and there were 61 members of the faculty. There were 82,000 volumes in the library. President, Miss M. Carey Thomas, LL.D.

**BUCHNER, EDUARD.** A German chemist, died August 26, 1917, of wounds received while fighting at the front as major in the German army. He was born in Munich in 1860, was educated at the universities of Munich and Erlangen, was appointed lecturer in chemistry at Munich in 1891, professor of chemistry at Kiel in 1893, at Tübingen in 1896, and at the Agricultural College of Berlin in 1898. The Nobel prize for chemistry was awarded him in 1907, and he became professor at Breslau in 1909. In 1910 he was made a Privy Councillor. Buchner's fame as a chemist is based on his discovery that the liquid obtained by crushing yeast with fine quartz sand and subjecting the mass to a pressure of several hundred atmospheres possesses, like yeast itself, the power of setting up "fermentation" in solutions of maltose, grape sugar, invert sugar, etc. This proved that the alcoholic fermentation of sugars is caused immediately, not by the *physiological processes* going on in the organism of the living yeast, but by the purely *chemical action* of an enzyme ("zymase" or "endotrypsin"). He wrote, jointly with his brother, Hans Buchner, *Die Zymase-gährung* (Munich, 1903).

**BUCKWHEAT.** Under the stress of war conditions buckwheat assumed a more important place among the crops of the United States in 1917. This was largely due to the fact that its short period of growth and its capacity to produce fair yields on soils of medium fertility make it a desirable catch crop valued for the food and feedstuffs material that it produces. Estimates given out by the United States Department of Agriculture placed the 1917 area at 1,006,000 acres as against 828,000 acres the preceding year and the largest since 1869. The production was estimated at 17,460,000 bushels, or 5,798,000 bushels more than in 1916 and 946,000 bushels above the average for the five years 1911-1915. The average yield per acre was 17.4 bushels, or 3 bushels under the average for this 5-year period. The average farm value on December 1 of 160.1 cents per bushel constituted a record price and the total value of the crop on this basis, amounting to \$27,954,000, was also unprecedented. As in previous years, New York and Pennsylvania were by far the leading states in acreage and yields, producing over one-half of the entire crop of the country. The Canadian buckwheat crop was estimated at 7,189,000 bushels and the total value at about \$5,000,000, the quality being rated at 63 per cent of perfect.

**BUFFALO BILL.** See CODY, WILLIAM F.

**BUILDING OPERATIONS.** Building in the United States in 1917 suffered greatly from war and financial conditions. The high cost and shortage of structural materials, together with labor conditions, developed from the opening of the year so that in the latter months, builders and contractors were unable in many cases to

proceed with work under way or to undertake new work with any assurance of being able to complete it within a definite time or a definite cost. At the beginning of the year much building was under way on account of factories whose business had been expanded by the war conditions. It was true that costs of materials and labor were mounting, but even under such conditions much work was being undertaken. With the entry of the United States into the war, conditions changed, and with various shortages and lack of transportation, building tended to decrease. Nevertheless, throughout the country, there was considerable activity as shown by the accompanying returns that may be considered as typical.

According to *Dun's Review* permits taken out for new construction at 75 representative cities in the United States called for the expenditure of \$591,468,244, as against \$853,426,106 in 1916, a decline of 30.7 per cent. The tendency toward contraction was especially noticeable during the latter part of the year. The figures for 1917 and 1916 are given in the accompanying table.

**NEW YORK.** The showing at New York City was very unsatisfactory, permits granted at that centre amounting to only \$83,370,847, a falling off of 56.2 per cent as compared with the \$190,771,532 of the previous year. The large figures of 1916, however, were, to a large part, accounted for by a change in the building code, which resulted in the extensive filing of plans before the new law went into effect.

In the Borough of Manhattan, New York City, the estimated costs for plans for 321 new buildings filed at the Bureau of Buildings, during 1917, aggregated \$31,069,625, as against \$114,690,145 for 564 new buildings during 1916. During the earlier months of the year, the building industry increased its operations by about \$5,000,000 over the same period in 1916, but after the declaration of war and the period of financial uncertainty, construction steadily decreased. This was also due to the difficulty in obtaining materials, and found expression in a remarkable decrease toward the end of the year. Thus the estimated cost of new buildings during the month of December was \$549,000, compared with \$1,892,800 in November and \$4,022,860 in December, 1916. This was a decrease of about \$3,500,000 from December, 1916, and about \$1,300,000 from November. In the Borough of Manhattan, there was also a corresponding decrease in alterations. The estimated cost of alterations during 1917 was \$13,669,644, of which \$1,241,655 was called for by specifications filed in December. The total for 1916 was \$19,387,899, of which \$1,104,730 was called for by December plans.

Only eighteen of the cities listed in *Dun's Review* reported any gain over 1916, and in no instance was the improvement especially significant. On the other hand, there was a sharp falling off at Boston, Philadelphia, Chicago, Detroit, Louisville, Milwaukee, Minneapolis, Pittsburgh, Portland, Ore., Rochester, St. Louis, St. Paul, Springfield, Mass., Toledo and Washington. This resulted in a pronounced loss in the aggregate of all cities outside New York, the total amounting to \$508,097,397, as against \$662,515,574 in 1916, a decrease of 23.2 per cent.

**COMPARATIVE STATISTICS IN U. S.** The activity in building and proposed construction

in the United States in 1917 was indicated by the above comparative statistics of building and engineering operations in 1917, based upon contracts awarded, compiled by the F. W. Dodge Co. of New York. In the States north of the Ohio and east of the Missouri rivers, viz.: New England, New York, New Jersey, Pennsylvania, Maryland, Delaware, District of Columbia, Virginia, Ohio, West Virginia, Illinois, Indiana, Iowa, Wisconsin, Michigan, Minnesota, North and South Dakota, and portions of Missouri and Eastern Kansas, the contracts awarded for the year 1917 amounted to \$1,618,157,000 as compared with \$1,356,989,397 in 1916. In New England the contracts awarded for the year 1917 amounted to \$198,874,000 and in 1916 to \$209,100,000. While in New England, as indicated, there was a decrease in 1917 over 1916, in other parts of the country there was an increase as shown below. In New York and Northern New Jersey, the contracts awarded for the year 1917 were \$333,337,000 as compared with \$283,659,500 in 1916. In Eastern Pennsylvania, Southern New Jersey, Maryland, Delaware, District of Columbia, and Virginia, contracts were awarded for the year 1917 amounting to \$212,220,000 and for 1916 amounting to \$165,180,000. In Western Pennsylvania, West Virginia, and Ohio, contracts awarded for the year 1917 were \$229,210,000 and in 1916 \$177,047,000. In the central west, Illinois, Indiana, Iowa, Wisconsin, Michigan, and portions of Missouri and eastern Kansas, 1917 contracts were \$596,479,000 as compared with \$455,696,897 in 1916. In Minnesota and North and South Dakota, comparative figures were 1917, \$48,037,000 and 1916, \$66,306,000.

**FRANCE.** In France, the Minister of the Interior appointed during the year a committee of fifteen members to be known as the "Commission Consultative des Marches et des Stocks," which was to study the purchase of material for rebuilding France and the award of contracts for provisional warehouses and final reconstruction work in the invaded districts.

**ZONING REGULATIONS.** The zoning law in the City of New York which was in operation in 1917, prohibited the erection of a very high building over the full area of the lot. Accordingly, during 1917, a number of new law buildings were constructed or put under way and a few buildings of the old type for which plans had been filed were erected. Of the latter class, one of the most notable was the Bush Building occupying the full area of a 50 x 90-ft. lot on the south side of Forty-second Street, near Broadway, New York City. With twenty-eight usable floors, it was the highest in uptown New York, and by the use of special brick work and construction, it was made to appear like a tower building. The steel frame reached to a height of thirty ft. and represented high, narrow framing of a symmetrical character with adequate wind-bracing.

See ARCHITECTURE; CITY PLANNING; CONCRETE; FINANCIAL REVIEW.

**BUKOWINA.** An Austrian crownland and titular dukedom south of eastern Galicia, bordering Russia and Rumania on the east and Rumania on the south. The area is 4031 square miles, or about half that of Massachusetts. Population, December 31, 1910, 800,098, compared with 730,195 in 1900. The estimated population in 1913 was 818,328. According to the

1910 census, adherents of the Orthodox Church numbered 547,944 (68.49 per cent); Catholics, 125,404 (15.67 per cent); Jews, 102,919 (12.86 per cent); Evangelicals, 20,513 (2.56 per cent). In 1910 the number of Austrian subjects was 794,929; of these, Ruthenian was the vernacular of 305,101 (38.38 per cent); Rumanian, 273,254 (34.38 per cent), which includes almost all Rumanian-speaking Austrians; German, 168,851 (21.24 per cent); Polish, 36,210 (4.55 per cent); Hungarian, 10,391 (1.31 per cent), which includes almost all Austrians of Hungarian vernacular; Bohemian, 1005 (0.13 per cent). The capital of the Bukovina is Czernowitz, which is the seat of one of the eight Austrian universities; its notably mixed population was 87,113 at the 1910 census and 94,000 as estimated June 30, 1914. Other towns are Radautz, with 16,640 inhabitants in 1910; Suczawa, 11,401; Storozynetz, 10,353. The Bukovina has a unicameral diet of sixty-three members; it is represented in the lower house of the Austrian Reichsrath by fourteen members.

**BULGARIA.** A country of Europe whose separate identity was established July 13, 1878, by the treaty of Berlin. The same treaty also declared eastern Rumelia an autonomous province; but since the successful revolution at Philippopolis of September 18, 1885, it has been incorporated with Bulgaria, under the name Southern Bulgaria, and the accomplished fact was recognized by the arrangement of April 5, 1886. It now forms an integral portion of Bulgaria, with the same ruler, laws, and mode of administration. United Bulgaria is bounded on the north by Rumania, from which it is separated by the Danube; on the west by Serbia and Macedonia; on the east by the Black Sea; and on the south by the Turkish province of Adrianople.

Bulgaria alone of the Balkan States has thrown in her lot with the Central Powers; she replied to the Russian ultimatum of October 3, 1915, by a declaration of war on Serbia October 12, 1915.

**AREA, ETC.** Previous to the Balkan wars, the area was given at 96,345.5 sq. kilometres (37,199 sq. miles), and the population at 4,337,513. The area acquired from Turkey in 1913 is stated at 25,257 square kilometres, with an estimated population of 656,535; area ceded to Rumania, 7525 square kilometres, with 282,131 inhabitants. Thus the total area is reckoned at 114,017 square kilometres, with a population of 4,711,917.

The ancient Bulgars were of Finnic stock; the modern Bulgarians are made up of Slavic, Teutonic, and Mongoloid elements, amalgamated with Mussulman and Greek. Their language belongs to the southern Slavic group and the Cyrillic alphabet is used.

The state religion is that of the Orthodox Greek Church, to which over 3,000,000 of the population belong, but its control is independent of the Orthodox communion, and is exercised by the Bulgarian exarch and the national synod of bishops. There are 643,253 Mohammedans among the inhabitants. Education is free and obligatory. Theoretically the state owns the land, but the practice is that the land is held on a perpetual lease by a multitude of small farmers, who pass it on to their heirs and pay one-tenth of the produce as rent. All minerals belong to the state.

No official figures are available for production since Bulgaria joined the Central Powers; but an English authority is responsible for the statement that 1,040,700 metric tons of wheat, 215,650 of rye, 320,900 of barley, and 107,000 of oats were the result of the 1916-17 harvest.

**COMMERCE, ETC.** The exports consist principally of cereals (especially wheat), live stock, essence of roses, woolens, skins, cheese, eggs, timber, cocoons, and tobacco; the principal imports being textiles, metal goods and machinery, colonial wares, leather, building materials, petroleum and other oils, paper, salt fish, rice, and coal.

In the table below will be found imports and exports in thousands of leva:

	1908	1910	1912	1913	1914
Imports	130,150	177,357	213,110	189,421	241,490
Exports	112,357	129,052	156,407	93,205	154,425

According to Board of Trade returns Bulgarian imports from the United Kingdom were valued at £1,002,423 in 1912, £471,579 in 1913, £857,856 in 1914, £85,505 in 1915; 1916 none. Exports to the United Kingdom: £491,484 in 1912, £40,782 in 1913, £195,143 in 1914, £41,974 in 1915, £800 in 1916.

Austria-Hungary and Germany were the leading countries of origin and destination. Vessels entered in 1914, 11,755, of 3,132,481 tons; cleared 11,710, of 3,108,505 tons.

State railways (1916), 1675 miles; private lines, 149 miles. Bulgaria adopted the Gregorian calendar April 1, 1916. A British authority gives the estimated revenue for 1917 at £17,519,134 and the expenditure at £17,519,134; and calculates the debt at £67,910,278 on May 31, 1916.

Ferdinand I, Czar of the Bulgarians, was born in Vienna, February 26, 1861, youngest son of the late Prince Augustus of Saxe-Coburg and Princess Clementine of Bourbon-Orleans, a daughter of Louis Philippe. He has served as an officer in the Austrian army, and possesses large estates in Hungary. After the deposition of Prince Alexander in September, 1886, Prince Ferdinand was elected Prince of Bulgaria, and on August 14, 1887, took the oath to the Bulgarian constitution at Tirnovo. His election was not formally recognized by the Porte and the Powers until February, 1896. In 1908, Bulgaria declared herself an independent kingdom, and Prince Ferdinand was proclaimed Czar. His sovereignty was recognized by the Powers in April, 1909. He married (April 20, 1893), Princess Marie Louise, daughter of the Duke of Parma; and has two sons, of whom the elder, Prince Boris, born January 30, 1894, was in 1896 admitted to the Orthodox Greek Church. The Princess Marie Louise died January 31, 1899, and the Czar married (February 28, 1908), Princess Eleanora, elder daughter of Prince Henry IV of Reuss-Köstritz.

The executive power in Bulgaria is vested in the king, assisted by a council of ministers, and the legislative power in a single chamber, the Sobranje or national assembly, elected for five years by manhood suffrage in the proportion of one member to every 20,000 of the population. There is also a great Sobranje, consisting of delegates selected in the proportion of one to 10,000 of the population, to which constitutional and other questions, such as a vacancy

on the throne or the acquisition of territory, must be referred. See **WAR OF THE NATIONS**.

**BURMA.** The largest and easternmost province of British India. Ethnographically Burma is not Indian, but Indo-Chinese. The area is stated at 230,839 square miles. Population in 1911, 12,115,217, as compared with 10,490,624 in 1901. Of the 10,721,453 Buddhists returned for India by the 1911 census, 10,384,579 were in Burma. The capital is Rangoon, fifth city of India, with 293,316 inhabitants; Mandalay, 138,299.

**BURNAND, Sir FRANCIS COWLEY.** A British editor and dramatic writer, died at Ramsgate, England, April 21, 1917. He was born in 1836, studied at Eton and at Trinity College, Cambridge, where he founded the Amateur Dramatic Club. He prepared to take orders in the English Church, but after becoming a convert to Roman Catholicism, took up the law and established himself as a barrister at Lincoln's Inn. Even as a student he had begun to write light plays, and soon he gave most of his time to this occupation, providing pieces that were presented in various London theatres. He started to contribute to the periodical *Fun*, but soon shifted over to *Punch*, on which he remained for forty-four years, till 1906. From 1880 till his retirement he served as chief editor, succeeding Tom Taylor. Among more than 120 plays by Burnand the most successful was his *Latest Edition of Black-Eyed Susan*, a burlesque of Douglas Jerrold's play, which ran for 800 nights in London (500 more than the original) and was also played for long in the United States and elsewhere. *The Colonel* was one of his light comedies. With Sir Arthur Sullivan, he wrote the light operas *Contrabandista* and *The Chieftain*, with R. C. Lehmann *His Majesty*, and to A. Cellier's music the popular *La Cigale*. Besides many collections of extracts from *Punch*, Burnand published *A. D. C. Reminiscences*, and, in 1904, *Records and Reminiscences*. He was knighted in 1902.

**BURNHAM, HENRY EBEN.** An American legislator, died in Manchester, N. H., February 8, 1917. Born in New Hampshire, at Dunbarton in 1844, he graduated from Dartmouth College in 1865 and three years later was admitted to the bar. His first important political office was as member of the New Hampshire House of Representatives in 1873-74. From 1876 to 1879 Mr. Burnham served as judge of probate, in 1889 as chairman of the Republican State convention, and in 1893 as ballot law commissioner. For two terms, 1901-13, he sat in the United States Senate, not again being a candidate in 1912. In 1904 he was a delegate to the Republican National Convention.

**BUTTER.** See **DAIRYING**.

**BUTTERMILK THERAPY.** This widespread dietetic fad appeared in 1917 to be fast losing any scientific support it may have enjoyed in the past. The disciples of Metchnikoff held that it was possible to replace the so-called putrefactive organisms in the intestine by the lactic acid type of bacteria. Pure cultures of various lactic acid bacilli were given by mouth and even introduced directly into the large intestine, but there was little real evidence that the favorable clinical results obtained were due to anything more than the restricted diet, and the attendant hygienic measures. Hull and

Rettger made a comprehensive study of the factors involved in the changing of intestinal bacteria types, and found among other things that the direct feeding of bacterial cultures had little, if any, influence on the already existing intestinal flora. It had long been known that arrest of intestinal putrefaction could be obtained by substituting carbohydrates for proteins in the diet, especially when considerable quantities of milk were included. Milk was shown to contain an important constituent, namely, lactose (milk sugar). The lactic acid bacteria flourish best in the presence of lactose. Hull and Rettger concluded accordingly, that a combination of milk and lactose was the most practical and effective diet in intestinal putrefaction and auto-intoxication.

**BYNG.** Sir JULIAN HEDWORTH GEORGE. A British soldier, celebrated for his victory over the Germans in the drive for Cambrai on the Western Front, which began on November 20, 1917. He was born September 11, 1862, the seventh son of the second Earl of Strathford. After his military education he joined the Tenth Hussars in 1883, served with them in the Sudan campaign in 1884, in the South African War, 1899-1902, and in 1902-04 commanded the regiment. He was head of the Cavalry School at Netheravon, Salisbury Plain, 1904-05, and there enforced the strictest discipline. He was in command of the Second Cavalry Brigade, 1905-07; of the First Cavalry Brigade, 1907-09; and of the East Anglian Division, 1910-12. On the outbreak of the European war in August, 1914, he was with the British Expeditionary Force sent to Antwerp, and placed at the head of the Third Cavalry Division which distinguished itself in protecting the withdrawal of the Belgian forces and in making the heroic stand before Ypres. In the battles which prevented the Germans from reaching the seacoast Byng's troops greatly distinguished themselves. In 1915 he was in command of the Ninth Army Corps at the Dardanelles, and in May, 1916, he was placed at the head of the Canadian Army Corps on the Western Front. Under his leadership the Canadians distinguished themselves in the battle of the Somme and in the capture of Vimy Ridge. In June, 1917, Byng succeeded Gen. Sir Henry Edmund Allenby (q.v.) in command of the British Third Army. His attack on the Hindenburg line before Cambrai was a complete surprise to the enemy. It was made without artillery preparation and was successful largely because of the efficiency of the tanks. In four days over 100 guns and 9774 prisoners were captured; but these successes were largely neutralized by the German counter attacks which wrested half their gains from the British. Byng was promoted major general in 1909, lieutenant general in 1916, and general in 1917. See **WAR OF THE NATIONS**.

**CADOENA, LUIGI,** Count. See **WAR OF THE NATIONS**.

**CAETINI, SENATOR ONORATO, DUKE OF SERMONETA.** An Italian statesman, died September 2, 1917, at Rome. He was born in Rome January 18, 1842, and succeeded to the title in 1882. After completing his education he early entered politics, being enthusiastic in the cause of Italian unity and actively participating previous to 1870 in the efforts made in its behalf. He brought to King Victor Emmanuel in Florence news of the result of the plebiscite of the

Roman people affirming their support of the Kingdom of Italy. This completed the unification of the country. Caetani afterward became Italian Minister of Foreign Affairs. He was a former president of the National Geographic Society of Italy.

**CAILLAUX, JOSEPH.** See FRANCE, *History*; and WAR OF THE NATIONS.

**CALCREOSE.** A chemical combination of approximately equal parts of creosote and lime. Calcreose is a dark brown powder tasting like phenol and having an empyreumatic odor. It is partly soluble in water. Calcreose was claimed to have the same effect as creosote when administered internally, but not so readily to upset the stomach as creosote when given alone. It was also claimed that relatively large quantities of creosote might be tolerated in this form, possibly because of the slower absorption. The drug was marketed in a solution and in four grain tablets.

**CALIFORNIA. POPULATION.** The population in the State in 1910 was 2,377,549. The estimated population on July 1, 1917, was 3,039,032.

**AGRICULTURE.** The acreage, production, and value of the principal crops as estimated by the United States Department of Agriculture in 1916-17 are as follows:

	Acreage	Prod. bu.	Value
Corn .....1917	75,000	2,400,000	\$4,440,000
1916	64,000	2,048,000	2,540,000
Wheat ....1917	375,000	7,425,000	14,850,000
1916	350,000	5,800,000	8,512,000
Oats .....1917	196,000	6,860,000	5,881,000
1916	200,000	6,500,000	4,680,000
Rice .....1917	80,000	5,600,000	9,800,000
1916	58,000	3,422,000	3,081,000
Potatoes ..1917	105,000	15,225,000	22,888,000
1916	75,000	10,575,000	14,805,000
Hay .....1917	2,400,000	a 4,560,000	87,552,000
1916	2,500,000	4,375,000	55,125,000
Cotton ....1917	117,000	b 67,000	9,380,000
1916	52,000	44,000	4,362,000

a Tons. b Bales of 500 lbs. gross weight.

**MINERAL PRODUCTION.** The decrease in 1916 in the number of productive mines in the State continued in 1916, yet the production of gold, silver, copper, lead, and zinc was \$7,485,419 more than in 1915. The production of gold in 1916 was 1,035,744 fine ounces, valued at \$21,410,741, a decrease of 49,901 fine ounces, valued at \$1,031,555. The deep mines of the State yielded 620,897 fine ounces of gold, valued at \$12,835,084. The placer mines yielded 414,847 fine ounces, valued at \$8,575,657. The silver production in 1916 was 2,564,354 fine ounces valued at \$1,687,345, an increase of 885,599 ounces in quantity, and \$836,216 in value over 1915. The mined production of copper in 1916 was 55,897,118 pounds valued at \$13,750,691, an increase of 15,145,493 pounds in quantity, and \$6,519,157 in value over 1915. The lead produced in 1916 amounted to 12,407,493 pounds valued at \$856,117, compared with 4,579,245 pounds valued at \$215,225 in 1915. The recoverable mine production of zinc in 1915 was 13,094,032 pounds, valued at \$1,623,660, compared with 15,256,485 pounds valued at \$2,044,369 in 1916, an increase of 2,162,453 pounds in quantity, and \$420,709 in value. This production is the largest ever made in the State. In marked contrast to conditions in the last nine years, the petroleum output for 1915 followed

a decline, but in 1916 showed an increase to 90,951,936 barrels. As a consequence of the remarkable increase of petroleum in Oklahoma, California again ranked second among the oil-producing States.

**TRANSPORTATION.** The total railway mileage in the State on June 30, 1916, was 5646. This included main tracks only. There was no construction during 1917.

The railways having the longest mileage were: Denver and Rio Grande, 1579; California and Southern, 808; Union Pacific, 591; Atchison, Topeka and Santa Fé, 506; Chicago, Burlington and Quincy, 394.

The legislature of 1917 passed several amendments to the Public Utilities Acts.

**FINANCE.** According to the report of the State Treasurer the total receipts for the biennial period, July 1, 1914—June 30, 1916, were \$67,732,218. The disbursements were \$71,970,231. At the beginning of the period there was a balance on hand of \$10,742,915, and at the end, \$9,228,465. The bonded debt of the State on June 30, 1916, was \$33,009,500.

**EDUCATION.** The total enrollment in the public schools of the State in 1917 was 564,625; of these 428,381 were in the elementary schools, 112,684 in high schools, and 23,560 in the kindergartens. The average daily attendance in the elementary schools was 348,304; in the high schools 62,865; and in the kindergartens 12,828. There were in all the schools 15,734 female teachers and 3050 male teachers. The total expenditures for school purposes were \$33,250,731. The average monthly salary of teachers in the elementary schools was \$81.74; in the kindergartens \$78.10, and in the high schools the average yearly salary was \$1473.

**CHARITIES AND CORRECTIONS.** The charitable and correctional institutions include State Prisons at San Quentin and Folsom, the Preston School of Industry, the Whittier State School, California School for Girls, State Hospitals at Stockton, Napa, Agnew, and Mendocino, the Southern California State Hospital, the New State Hospital, the Sonoma State Home, the Folsom State Hospital, and the Industrial School for Adult Blind. The total expenditure for these institutions is about \$2,500,000 annually.

**POLITICS AND GOVERNMENT.** There were no elections in the State in 1917, and there were few happenings of political interest. On March 16, William D. Stephens, lieutenant governor, became Governor of the State to succeed Hiram Johnson, who entered the United States Senate on March 4. On December 17, the home of Governor Stephens was partially destroyed by a bomb without, however, resulting in the injury of any of the inmates. There were strikes especially in the shipbuilding industry during the year, and these will be found discussed in the article STRIKES. See PROSTITUTION.

**LEGISLATION.** Among the more important measures passed by the legislature of 1917 are those noted here. Several measures relating to the judiciary and the administration of justice in the State were enacted. One of these proposed a constitutional amendment to make practically the whole of the judiciary article of the constitution, which now provides in detail for the organization of the courts throughout the State, the general law subject to amendment or repeal by the legislature. The adoption of

this amendment would give to the legislature unlimited power to provide in its discretion for the efficient administration of the judicial business of the State. A measure was passed forbidding the acceptance of the diploma of any law school for admission to the bar, but required applicants to be examined. Provision was made for a State council of defence to coöperate with the National Council. The sale of certain articles manufactured in the prisons of other States, unless labeled, and unless the place where such goods are offered for sale post a conspicuous notice that such goods are for sale, was prohibited. For purposes of voting, the husband's residence was made that of his wife's. Provision was made for absent vote by those enrolled in the national service. Women employed in the care and preparation of foods were partially exempted from the eight-hour law.

A constitutional amendment was passed by the legislature providing for a compensation law subject to the approval of the people. A "Blue Sky" law was enacted. Amendments were made to the laws relating to insurance, also to the laws affecting the law for the organization of corporations. Provision was made for the regulation of stages or automobiles operating as common carriers over fixed routes. Provision was made for the commitment and care of the feeble-minded or criminally inclined persons, and segregation of the feeble and insane by removal from other institutions was put into effect. A constitutional amendment providing for social insurance, subject to the approval of the people, was passed.

**STATE OFFICERS.** Governor, William D. Stephens; secretary of state, Frank C. Jordan; treasurer, Friend William Richardson; comptroller, John S. Chambers; attorney-general, U. S. Webb; superintendent of public instruction, Edward Hyatt; commissioner of insurance, Alexander McCabe—all Progressives except F. C. Jordan and Edward Hyatt, Republicans.

**JUDICIARY.** Supreme Court: Chief Justice, Frank M. Angellotti; associate justices, William P. Lawlor, Lucien Shaw, H. A. Melvin, F. W. Henshaw, M. C. Sloss, and William G. Lorigan; clerk, B. Grant Taylor.

**CALIFORNIA, UNIVERSITY OF.** A co-educational State institution of higher learning at Berkeley, Cal., with several professional schools in San Francisco. In the fall of 1917 there were 11,960 students and 503 members of the faculty. Volumes in the library numbered 340,000. The University of California was founded in 1860. President, Benjamin Ide Wheeler, LL.D.

**CALORIMETRY.** Our knowledge of the mechanism of heat regulation in the human body and its relation to water elimination, has been materially increased by the use of the calorimeter. At Bellevue Hospital, New York, 300 experiments carried out under conditions representing a climatic environment of 71.6° and 75.2° F. and a relative humidity of from 25 to 50 per cent were made in the Sage respiration calorimeter. Thirteen normal men, lightly clad, were found to give off on the average approximately one fluid ounce of water an hour, representing the vaporization of water from the skin and lungs. This represented a 24 per cent loss of heat calories. It was estimated that one

quarter of the heat produced in the body is lost through the skin and respiratory passages.

**CAMBODIA.** A kingdom of Farther India, constituting a French protectorate and forming part of French Indo-China. The capital is Pnom-Penh; its population, which is variously stated, is probably over 60,000. Much of the country is covered with forest. The natives cultivate rice, cotton, betel, tobacco, cardamoms, etc., and raise cattle and buffaloes. Most of the foreign trade passes through Saigon (Cochin-China). Native king, Sisowath. See **FRENCH INDO-CHINA**.

**CAMEROONS** or **CAMEROON.** See **KAMERUN**.

**CAMOUFLAGE.** A war term derived from the French slang verb long in use, *se camoufler*, to disguise one's self. See **WAR OF THE NATIONS**, *Aërial Warfare*.

**CAMP CONSTRUCTION.** See **CITY PLANNING**.

**CAMPFIRE GIRLS OF AMERICA.** An organization founded by Charlotte V. Gulick in 1913 and devoted to the cause of good health, especially by life and work in the open air, and to economy and social improvement. The Campfire has definite and important meanings in connection with this organization. Camping out together is regarded as basic, not primarily because of the enjoyment of it, but because of the formation and deepening of friendships, and the opportunities it gives to girls and their guardians to come into close relation and into contact with nature, thereby escaping the distractions of the city and gaining the leisure for a time to deal more directly with the larger and quieter things of life. In 1916, 32,884 girls camped out for a week or more, and 45,502 girls camped out in 1917. The membership has grown very rapidly, starting with a total of 35,980 in 1913 and increasing to 99,937 in 1917. Twenty-five Guardians Associations were organized in eighteen States in 1917, besides a number of training camps and summer school courses. These courses were all related to the training of women to become guardians of campfires.

The original programme of the organization's work was varied and enlarged by the outbreak of the war. Its previous lines of activity were put into the background. A programme, called the "Minute Girl Programme," received the approval of President Wilson. Its leading requirements were: Coöperating with the Red Cross in its classes and in its work; organizing in groups of from six to twenty to study the saving of food and of labor in the homes; and the operation of gardens in accordance with instructions from the Department of Agriculture. It was made a rule to walk 100 miles a month so as to become "hard" as a soldier and to save money. Campfires are organized during the war to work in this programme, without undertaking the ritual, ceremony, or ranks of the Campfire Girls, although they are free to do so at any time. As a result, the average number of charter members taken in each month during the nine months preceding the declaration of war was 2650, and after the declaration of war between the United States and Germany the average taken during the first three months was 3347. All over the United States, Campfire Girls were taking care of small children while their mothers were doing Red Cross work, working in the gardens, or were farming. The or-

ganization publishes monthly *Wohelo*, a magazine for girls. The president in 1917 was Dr. Luther H. Gulick; the secretary, Lester F. Scott.

**CANADA, DOMINION OF.** A British self-governing dependency, extending from the United States to the Arctic Ocean and from the Atlantic to the Pacific. The capital is Ottawa, in the province of Ontario.

**AREA AND POPULATION.** Canada consists of nine provinces and two territorial divisions, having a gross area computed at 3,729,665 square miles, of which 3,603,910 square miles are land and 125,755 square miles water. This water area is exclusive of Hudson Bay, Ungava Bay, the Gulf of St. Lawrence, and all other tidal waters, excepting that portion of the River St. Lawrence which is between Pointe-des-Monts in Saguenay and the foot of Lake St. Peter. The gross area is larger than that of the United States, with Alaska. The gross area of the United States and all its possessions, which is computed at 3,743,444 square miles, is not greatly in excess of the gross area of Canada. But it should be borne in mind that much of the Canadian area lies so far north that it is unfit for occupation and development.

The census of June 1, 1911, returned a population of 7,206,643; an estimate of 1916, 8,361,000.

The following table shows the provinces, their capitals, the gross area, and the population by provinces according to the census of June 1, 1911:

Provinces	Capitals	Sq. miles	Pop. '11
Alberta .....	Edmonton	255,385	374,663
British Columbia .....	Victoria	355,855	392,480
Manitoba .....	Winnipeg	251,832	461,630
New Brunswick .....	Fredericton	27,985	351,889
Nova Scotia .....	Halifax	21,428	492,338
Ontario .....	Toronto	407,262	2,527,292
Prince Edward Is. ....	Charlottetown	2,184	93,728
Quebec .....	Quebec	706,834	2,006,779
Saskatchewan .....	Regina	251,700	492,432
Yukon Territory .....	Dawson	207,076	8,512
Northwest Ter. ....	Ottawa	1,242,224	5,900
<b>Canada .....</b>	<b>Ottawa</b>	<b>3,729,665</b>	<b>7,206,643</b>

In 1911, males numbered 3,821,095, and females 3,384,648, the number of females to each 1000 males being 886, as compared with 952 in 1901. The proportionate increase of males was due principally to immigration. In Canada (exclusive of Yukon Territory and the Northwest Territories) the male population 18 to 45 years of age was 1,720,070 in 1911; of these, 1,109,383 were Canadian born, 306,377 British born, and 304,310 foreign born. The total number of persons born in Canada was 5,619,682 (77.98 per cent); persons born in other parts of the British Empire, 833,422 (11.58 per cent); foreign born, 752,732 (10.44 per cent). The more important returns for birthplace in 1901 and 1911, with percentages for 1911, are shown below:

	1901	1911	P. ct.
Canada .....	4,671,815	5,619,682	77.98
British Isles .....	390,019	784,526	10.89
Other British .....	30,693	48,896	0.68
United States .....	127,899	303,680	4.21
Austria-Hungary .....	28,407	121,430	1.68
Russia .....	31,231	100,971	1.40
Norway and Sweden .....	10,256	49,194	0.68
Germany .....	27,300	39,577	0.55
Italy .....	6,854	34,739	0.48
China .....	17,043	27,083	0.38

Population of the larger cities in 1911: Montreal (P. Q.), 470,480; Toronto (Ont.), 376,538; Winnipeg (Man.), 136,035; Vancouver (B. C.), 100,401; Ottawa (Ont.), 87,062; Hamilton (Ont.), 81,969; Quebec (P. Q.), 78,710; Halifax (N. S.), 46,619; London (Ont.), 46,300; Calgary (Alta.), 43,704; St. John (N. B.), 42,511; Victoria (B. C.), 31,660; Regina (Sask.), 30,213; Edmonton (Alta.), 24,900.

A census of the Prairie Provinces was taken June 1, 1916. The totals, as compared with the figures for 1906, are shown below:

	Pop. 1906	Population, 1916		
		Males	Females	Total
Manitoba .....	365,688	294,609	259,251	553,860
Saskatchewan .....	257,763	363,787	284,048	647,835
Alberta .....	185,412	277,256	219,269	496,525
<b>Total .....</b>	<b>808,863</b>	<b>935,652</b>	<b>762,568</b>	<b>1,698,220</b>

The following table shows the city population of the Prairie Provinces:

Manitoba:	1901	1906	1911	1916
Winnipeg .....	42,340	90,153	136,035	163,000
Brandon .....	5,620	10,408	13,889	15,212
St. Boniface .....	2,019	5,119	7,488	11,021

Red Deer .....	323	1,418	2,118	2,203
Wetaskiwin .....	550	1,652	2,411	2,048

The table below shows the marriage rates and births and deaths. The figures are not strictly comparable, owing to the diversity of practice which prevails in the various provinces. Thus, in Nova Scotia, Quebec, and Ontario stillbirths are eliminated from the calculations, but in the Prairie Provinces, British Columbia, and Prince Edward Island they are included. New Brunswick does not report vital statistics.

	Marr.	Births		Deaths	
	Rate	No.	Rate	No.	Rate
Alta. .... 1914	8.19	13,685	24.25	4,147	7.35
..... 1915	8.55	13,452	27.36	3,588	7.30
B. C. .... 1914	8.80	8,754	17.93	3,974	8.14
..... 1915	6.43	8,558	16.22	3,832	7.26
Man. .... 1913	13.24	16,422	36.34	5,919	13.10
..... 1914	10.88	17,449	33.50	5,617	10.78
N. S. .... 1914	7.26	12,771	25.46	7,527	15.01

..... 1915	8.32	67,032	25.15	33,294	12.49
P.E.I. .... 1914	5.80	1,511	16.12	1,012	10.80
..... 1915	5.65	1,743	18.59	1,085	11.57
P. Q. .... 1913	8.13	79,089	37.70	36,200	17.33
..... 1914	7.62	80,361	38.00	36,002	17.02
Sask. .... 1913	7.92	13,200	20.94	4,150	6.58
..... 1914	6.94	16,489	22.83	3,950	5.47

Immigration into Canada reached its highest point in the year ended March 31, 1913. Immigrant arrivals are reported as follows:

	U. Kingdom	U. States	Other	Total
1913 .....	150,542	139,009	112,881	402,432
1914 .....	142,622	107,530	134,726	384,878
1915 .....	43,276	59,779	41,734	144,789
1916 .....	8,604	36,937	2,936	48,537
1917 .....	8,282	61,389	5,703	75,374

Immigrants whose destination was the Maritime Provinces numbered, in the fiscal years 1916 and 1917 respectively, 5981 and 5710; Quebec, 8274 and 10,930; Ontario, 14,743 and 26,078; Manitoba, 3487 and 5247; Saskatchewan, 6001 and 9874; Alberta, 7215 and 12,418; British Columbia, 2839 and 5117 (including 315 Yukon). In the period 1901-17, total immigrant arrivals numbered 3,174,722.

**RELIGION AND EDUCATION.** The numbers of adherents of the larger religious denominations were as follows in 1911: Roman Catholics, 2,833,041 (increase per cent over 1901, 27.06); Presbyterians, 1,115,324 (32.39); Methodists, 1,079,892 (17.78); Anglicans, 1,053,017 (53.05); Baptists, 382,666 (20.83); Lutherans, 229,864 (148.43). Further details may be found in the 1915 YEAR BOOK.

Persons six years of age and over at the 1911 census numbered 6,154,511; of these, 521,842, or 8.48 per cent, were unable to read. Persons between the ages of five and twenty numbered 2,306,558; of these, 1,147,838, or 49.76 per cent, attended school for some period in 1910. The following table shows for 1916 the number of schools, of teachers, and of pupils enrolled, the percentage of average attendance, and the expenditure for public education (year ended December 31 for Alberta, Ontario, Prince Edward Island, and Saskatchewan; July 31 for Nova Scotia; and June 30 for British Columbia, Manitoba, New Brunswick, and Quebec):

	Schools	Teachers	Enroll.	Av. At.	Expend.
Alta. ...	2,170	4,607	99,201	60.75	\$6,121,614
R. C. ....	770	1,902	59,800	78.69	3,216,350

P.E.I. ....	476	595	18,362	61.79	244,572
P. Q. ....	5,998	7,982	251,492	77.73	16,622,837
Sask. ....	3,367	4,949	119,279	58.70	6,658,230

\* Figures are for 1915. † For elementary schools.

In the foregoing table, secondary schools are not included in the figures for Ontario, Quebec, and British Columbia. Ontario had, in 1916, 161 collegiate institutes and high schools, with 1038 teachers, 38,810 students, and an average attendance of 61.22 per cent. Quebec had, in 1915, 721 model (intermediate) schools, with 3356 teachers, 109,832 pupils, and an average attendance of 83.68 per cent; 321 academies, with 3454 teachers, 86,763 students, and an average attendance of 84.47 per cent; 21 Roman Catholic classical colleges, with 754 professors and 8251 students. British Columbia had, in 1916, 40 high schools, with 162 teachers, 4770 pupils, and an average attendance of 80 per cent.

**AGRICULTURE.** Final official figures for the 1917 crops were not available at the end of the year. In the following table, taken from data published by the International Institute of Agriculture, provisional figures for crop areas and production are shown for 1917 as compared with the average area and production in the

five-year period 1911-15; areas are in hectares, production in metric quintals:

	Hectares		Quintals	
	1917	1911-15	1917	1911-15

Previous estimates of the areas and yields of the field crops of Canada for 1915 and 1916 have been corrected to agree with the finally ascertained results of the census of the Prairie Provinces, taken in June, 1916. These results indicate that the estimates of areas sown to the principal grain crops for the harvest of 1915, as compiled from the reports of correspondents, were considerably below the census returns as compiled from the individual schedules filled up for every farm. Thus, the census returns showed, for the Prairie Provinces in 1915, 13,867,715 acres of wheat instead of 11,744,700 acres. For 1916 the total area under field crops is placed at 38,930,333 acres, as compared with 39,140,460 in 1915, and 33,436,675 in 1914.

The following table shows for principal crops the area in thousands of acres and the production in bushels or tons in 1915 and 1916:

	1,000 acres		Bushels	
	1915	1916	1915	1916
Wheat .....	15,109	15,370	393,542,600	262,781,000
Oats .....	11,556	10,996	464,954,400	410,211,000
Barley .....	1,718	1,803	54,017,100	42,770,000
Rye .....	122	148	2,486,200	2,876,400
Peas .....	196	152	3,464,250	2,218,100
Beans .....	43	33	723,400	412,600
Buckwheat .....	344	342	7,865,900	5,976,000
Mixed grains .....	467	413	17,517,600	10,584,800
Flaxseed .....	463	658	6,114,000	8,259,800
Corn for husking .....	253	173	14,368,000	6,282,000
Potatoes .....	486	473	60,353,000	63,297,000
Turnips, man- golds, etc. ....	157	142	60,175,000	36,921,100
Hay and clover .....	7,777	7,821	10,612,000	14,527,000
Fodder corn .....	332	293	3,382,770	1,907,800
Sugar beets .....	18	15	141,000	71,000
Alfalfa .....	98	99	260,970	286,750

The total value of the field crops of Canada in 1916 is computed at \$886,494,900 (as compared with \$825,370,600 in 1915), including: grain crops, \$639,733,700 (\$601,093,300 in 1915); potatoes and sugar beets, \$51,422,300 (\$37,235,300 in 1915); fodder crops, \$195,338,900 (\$187,042,000 in 1915). The total for 1916 was higher than for any previous year. Average prices received by farmers in 1915 and 1916 respectively: wheat, 91 cents and \$1.31; oats, 36 and 51 cents; barley, 52 and 82 cents; rye, 77 cents and \$1.11; flaxseed, \$1.51 and \$2.04; peas, \$1.65 and \$2.22; beans, \$3.05 and \$5.40; buckwheat, 75 cents and \$1.07; mixed grains, 57 and 88 cents; corn for husking, 71 cents and \$1.07; potatoes, 60 and 81 cents; turnips, etc., 24 and 39 cents. Average prices per ton in 1915 and 1916: hay and clover, \$14.37 and \$11.60; fodder corn, \$4.91 and \$4.92; sugar beets, \$5.50 and \$6.20; alfalfa, \$12.68 and \$10.69.

The following table shows the area, in thousands of acres, and the yield, in thousands of

bushels, of wheat, barley, oats, and flaxseed in the Prairie Provinces in 1915 and 1916:

	Wheat		Barley	
	1,000 ac.	1,000 bu.	1,000 ac.	1,000 bu.
Manitoba:				
1915	2,800	69,337	567	16,658
1916	2,726	29,667	688	13,729
Saskatchewan:

1916	7,359	318,916	653	8,213

On June 11, 1917, a Board of Grain Supervisors of Canada, with offices at Winnipeg, was appointed by Order in Council under the War Measures Act, 1914, with wide powers of control over the disposition of grain, including the power to fix maximum prices at which grain may be sold. In pursuance of these powers, the board fixed the following prices per bushel of sixty lb. for different grades of wheat, to remain in force until August 31, 1918: from September 12, 1917, No. 1 Hard and No. 1 Manitoba Northern, \$2.21; No. 2 Manitoba Northern, \$2.18; No. 3, \$2.15; Alberta Red Winter No. 1, \$2.21; No. 2, \$2.18; No. 3 \$2.15. Prices for other grades of wheat have also been fixed by the board. By Order in Council of April 16, 1917, wheat, wheat flour, and semolina, were placed on the customs free list from April 17, 1917, instead of being subject to the import duties previously payable. Under the provisions of the American tariff, the removal of the Canadian import duties on wheat secured the free entry of Canadian wheat into the United States.

By provinces, the total areas and values of crops are reported as follows for 1915 and 1916:

Acres	1915		Values	
	1915	1916	1915	1916
Alta.	4,570,918	5,409,544	\$93,514,200	\$148,738,600
B. C.	292,880	289,850	11,825,700	15,523,000
Man.	4,843,816	5,030,960	92,318,800	76,749,000
N. B.	893,800	889,220	20,092,600	22,924,200
N. S.	727,280	746,580	19,556,700	22,369,800
Ont.	9,391,500	7,637,500	207,043,500	190,646,000
P.E.I.	481,930	485,910	10,830,400	14,124,100
P. Q.	4,901,760	4,590,200	104,683,000	102,987,300
Sask.	13,086,596	13,850,769	265,905,700	292,773,900
Can.	89,140,460	88,980,338	\$825,870,600	\$886,494,900

Number of live stock on farms as reported for June, 1916, and June, 1917, respectively: horses, 3,258,342 and 3,412,749; milch cows, 2,833,433 and 3,202,283; other meat cattle, 3,760,718 and 4,718,657; sheep, 2,022,941 and 2,369,358; swine, 3,474,840 and 3,619,382.

**FOREST PRODUCTS.** The estimated value of Canadian forest products was \$172,880,000 in 1915 and \$172,830,000 in 1916. In 1916, lumber produced amounted to 3,490,550 thousand board feet, valued at \$58,365,349; shingles, 2,897,562 thousand, \$5,962,933; lath, 665,588 thousand, \$1,743,940; firewood, \$62,000,000; pulpwood, \$19,975,000; fence posts and rails, \$8,000,000; cross-ties, \$3,750,000; cooperage, \$1,250,000.

**FISHERIES.** The total market value of Canadian fisheries as reported for the fiscal year 1916-17 surpassed the returns of any previous year, being \$39,208,378, as compared with \$35,860,708 in 1915-16. The increase was due to the greater demand for fish and the higher prices prevailing. The sea fisheries contributed a value of \$34,386,013, and the inland fisheries \$4,822,365. Value of the catch by provinces in 1915-16 and 1916-17 respectively; British Columbia, \$14,638,320 and \$14,637,346; Nova Scotia, \$9,166,851 and \$10,092,902; New Brunswick, \$4,737,145 and \$5,656,859; Quebec, \$2,076,851 and \$2,991,624; Ontario, \$3,341,182 and \$2,658,993; Prince Edward Island, \$933,682 and \$1,390,212; Manitoba, \$742,925 and \$1,344,179; Saskatchewan, \$165,888 and \$231,946; Alberta, \$94,134 and \$144,317; Yukon, \$63,730 and \$60,210.

The most valuable catch is salmon, which amounted to \$11,262,381 in 1915-16 and \$10,882,431 in 1916-17; lobsters, \$4,506,155 and \$5,508,054; cod, \$4,489,496 and \$5,449,964; herrings, \$2,906,887 and \$3,050,421; halibut, \$2,261,776 and \$2,263,573. British Columbia is predominant in the salmon fishery, and Nova Scotia in the cod.

**MINING.** The total value of Canada's production in 1916 was \$177,357,454; the highest previous record was \$145,634,812, in 1913. The cutting off of markets and the closing of metal exchanges in 1914, after the outbreak of the great war, resulted in closing down or restriction of operation at many properties. Recovery or readjustment came in 1915. In consequence of war demands, there was renewed activity in the production of copper, nickel, lead, zinc, steel, and certain non-metallic minerals; and the large total for 1916 is in some degree due to enhanced prices. In proportion of value, the provinces shared in the mineral output of 1915 as follows: Ontario, 44.6 per cent; British Columbia, 20.9; Nova Scotia, 13.1; Quebec, 8.8; Alberta, 7.2; Yukon, 3.6; Manitoba, 1.0; New Brunswick, 0.7; Saskatchewan, 0.3.

The table at the top of the following page shows the total value of the mineral output and of principal minerals, in thousands of dollars.

The reported copper output in 1915 and 1916 respectively amounted to 100,785,150 and 119,770,814 lb.; nickel, 68,308,657 and 82,953,

	1910	1913	1914	1915	1916

\* From Canadian ore only.

564 lb.; gold, 918,056 and 926,963 oz.; lead, 46,316,450 and 41,593,680 lb.; pig iron from Canadian ores, 158,595 and 115,691 short tons; coal, 13,267,023 and 14,428,278 short tons; cement, 5,681,032 and 5,359,050 bbl.

**MANUFACTURES.** In 1917 the Canadian Census and Statistics Office published the report on the postal census of manufactures which was taken in 1916 for the calendar year 1915. The following table compares the returns for 1915 with those for 1905:

	1905	1915	Increase	
			\$	Per cent
Establishments .....	15,796	21,306	5,510	34.88
Capital .....	\$846,585,023	\$1,994,103,272	1,147,518,249	135.54
Employees on salaries.....	36,496	52,683	16,187	44.35
Salaries .....	\$30,724,086	\$60,308,293	29,584,207	96.29
Employees on wages.....	356,034	462,200	106,166	29.82
Wages .....	\$134,375,925	\$229,456,210	95,080,285	70.76
Value of products.....	\$718,352,603	\$1,407,137,140	688,784,537	95.88

Establishments engaged in the manufacture of food products had an output in 1915 valued at \$388,815,362; textile products, \$144,686,605; timber and lumber, and remanufactures, \$123,396,686; iron and steel products, \$120,422,420; paper and printing, \$74,038,398; leather and its finished products, \$71,036,644; metals and metal products other than iron and steel, \$90,943,278; paper and printing, \$74,038,398; vehicles for land transportation, \$73,878,212; leather and its finished products, \$71,036,644; chemicals and allied products, \$45,410,486; liquors and beverages, \$34,859,927; tobacco and its manufactures, \$28,987,250; clay, glass, and stone products, \$27,244,813; vessels for water transportation, \$8,419,648; miscellaneous industries, \$134,268,231; hand trades, \$40,729,180; total, \$1,407,137,140.

The number of establishments employing five hands and over in 1915 was 15,593 (a decrease of 18.86 per cent from 1910). Their capital amounted to \$1,958,705,230 (there being an increase of 57.00 per cent over 1910); salaries and wages, \$283,311,505 (17.55 per cent increase); cost of materials, \$791,943,433 (31.66 per cent increase); value of products, \$1,381,547,225 (18.49 per cent increase). This value of products was thus distributed among the provinces: Ontario, \$715,531,839; Quebec, \$381,203,999; British Columbia, \$72,321,972; Nova Scotia, \$69,345,819; Manitoba, \$60,481,446; New Brunswick, \$37,303,900; Alberta, \$29,416,221;

Saskatchewan, \$13,355,206; Prince Edward Island, \$2,586,823; total, \$1,381,547,225.

**COMMERCE.** In both import and export values, the Canadian foreign trade in the calendar year 1917 surpassed by enormous figures the returns of any previous year. The increased values were in consequence not only of enhanced prices but of a larger volume of trade. The export expansion was in both raw materials and manufactures. The increase of imports was largely materials necessary in the production of manu-

factures. For the eleven months ended November 30, 1917, imports of merchandise for consumption were valued at \$943,500,000, and exports of Canadian produce at \$1,399,018,000, the excess of exports being \$455,519,000, as compared with \$262,957,000 in eleven months of 1916 and \$115,980,000 in the same period of 1915, while in the eleven months of 1914, 1913, and 1912 imports exceeded exports by \$108,824,000, \$233,647,000, and \$281,123,000 respectively.

The following table shows, for fiscal years ended March 31, the values in dollars of imports of dutiable merchandise, free merchandise, and coin and bullion, together with the values of the total imports:

	Merchandise		Coin & Bullion	Total Imports
	Dutiable	Free		
1911	291,818,801	170,222,529	10,206,210	472,247,540
1912	343,870,082	189,916,581	26,033,881	559,820,544
1913	456,086,187	230,518,226	5,427,979	692,032,392
1914	425,324,576	210,186,916	15,235,305	650,746,797
1915	318,951,094	178,500,808	181,992,992	629,444,894
1916	310,193,014	220,052,580	34,260,202	564,505,796
1917	480,165,357	384,339,089	28,081,120	892,585,566

The value in dollars of exports in fiscal year are shown in table on following page.

Imports of merchandise for consumption, as compared with exports of Canadian produce (these being the special trade), together with the totals of all imports and exports and the

	<i>Merchandise</i>		<i>Coin &amp;</i>	<i>Total</i>
	<i>Canadian</i>	<i>Foreign</i>	<i>Bullion</i>	<i>Exports</i>

1916 . . . . .	507,817,159	741,610,638	1,447,378,298	103,940,101
1917 . . . . .	845,330,903	1,151,375,768	2,268,343,714	147,623,230

The principal imports for consumption, in the fiscal years 1916 and 1917 respectively, included the following, valued in thousands of dollars: metals and minerals and manufactures thereof, 103,449 and 165,187, of which iron and steel and manufactures thereof 76,360 and 125,614; tin and manufactures, 5326 and 10,317; brass and manufactures, 3744 and 5886; copper and manufactures, 4443 and 8600; cotton and manufactures, 32,470 and 51,139; coal, coke, etc., 32,521 and 44,860; wool and manufactures, 30,371 and 42,467; sugar, molasses, etc., 22,735 and 34,380; provisions, 11,963 and 28,709; drugs, medicines, dyes, and chemicals, 17,095 and 27,590; oils, 13,943 and 21,620; fruits, 14,330 and 18,773; carriages, automobiles, bicycles, etc., 10,869 and 18,247; breadstuffs, 11,084 and 17,072; silk and manufactures, 8708 and 13,757; hides and skins other than fur, 12,442 and 12,864; wood and manufactures, 8622 and 11,490; rubber and gutta-percha and manufactures, 9544 and 11,256; leather and manufactures, 6514 and 11,212; flax, hemp, jute and manufactures, 7880 and 10,158; tea, 8272 and 7955; paper and manufactures, 4724 and 6848; electrical apparatus, 4896 and 6342; tobacco, 5753 and 6093; books, maps, pamphlets, periodicals, etc., 5125 and 5815; settler's effects, 3969 and 5085; hats, caps, bonnets, etc., 3341 and 4499; glass and manufactures, 2452 and 4099; spirits and wines, 3908 and 3884.

The following table shows for fiscal years the exports of Canadian products by great classes, in thousands of dollars:

	1913	1914	1915	1916	1917
Mfrd. ....	43,693	57,443	85,540	242,035	477,400
Agricultural ..	150,146	198,220	134,746	249,801	373,414
Animal ..	44,785	58,349	74,391	102,882	127,795
Mining ...	57,443	59,039	51,741	60,590	85,617
Forest ...	43,255	42,192	42,651	51,271	55,907
Fishery ...	16,337	20,624	19,687	22,378	24,889
Misc. ....	97	121	604	6,793	6,354
Total ...	355,755	431,588	409,419	741,611	1,151,376

One of the most extraordinary developments in the history of international trade was the expansion of Canadian export manufactures as indicated in the foregoing table. During the fiscal year 1917, the export of manufactured goods of home production, aggregating \$477,399,676,

of all kinds of Canadian merchandise in 1914 by over \$45,800,000. And it may be noted that this latter figure is greater than the value of all Canadian export manufactures in as recent a year as 1913. The principal contributing factor to this enormous increase was the shipments of munitions and explosives, amounting in the fiscal year 1917 to \$281,220,270, or nearly 59 per cent of the total export of domestic manufactures. But even if munitions and explosives be eliminated, there was an increase over the total of 1914 of \$138,735,954, or 242 per cent; thus ordinary lines of manufactured goods played an important part in the export development. Moreover, it should be pointed out that such important articles as flour, canned goods, bacon, cheese, rough lumber, etc., are placed under other classifications, although in the census returns they are designated factory products. Leading exports of domestic manufactures were as follows in the fiscal years 1916 and 1917 respectively, in thousands of dollars: munitions, 73,904 and 240,302; iron and steel manufactures, 50,062 and 44,754 (including wire and wire nails, 4483 and 9038); explosives, 7080 and 40,917; paper, 20,039 and 26,123; wood manufactures, 11,498 and 21,313 (including wood pulp, 10,377 and 20,404); gasoline launches, 147 and 15,150; carriages, automobiles, etc., 11,372 and 14,397; drugs, dyes, chemicals, etc., 6446 and 9214; leather and manufactures, 14,575 and 7409; clothing and apparel, 9148 and 6356; household effects, 4222 and 4315; agricultural implements, 3354 and 3576; liquors, 1432 and 2571.

The table below shows, for fiscal years, the exports of Canadian wheat and oats, total grain, and wheat flour, quantities in thousands and values in thousands of dollars:

	1913	1914	1915	1916	1917
Wheat, bu. ....	93,166	120,427	71,913	157,745	189,644

Wht. flr., bbl. .	4,478	4,832	4,952	6,400	7,426
Wht. flr., \$. ...	19,971	20,581	24,611	35,767	47,473

Export of other agricultural products, in the fiscal years 1916 and 1917, in thousands of dol-

lars: hay, 5849 and 4219; potatoes, 445 and 3299; clover and grass seed, 387 and 1256; apples, 577 and 571.

Export of the principal animal Canadian produce in the fiscal years 1916 and 1917, in thousands of dollars: bacon and hams, 27,090 and 43,778; cheese, 26,691 and 36,721; cattle, 12,626 and 7884; hides and skins other than fur, 6759 and 7147; dressed and undressed furs, 4778 and 5755; horses, 4701 and 4385; wool, 1498 and 2554; butter, 1019 and 2492.

Export of principal Canadian mining produce in the fiscal years 1916 and 1917, in thousands of dollars: copper, 14,670 and 22,745; gold, 16,870 and 19,671; silver, 14,298 and 15,871; nickel, 7715 and 8926; coal, 6033 and 6817; asbestos, 2962 and 4142; lead, 55 and 1188.

Leading forest exports in the fiscal years 1916 and 1917, in thousands of dollars: planks and boards, 23,880 and 25,977; wood blocks for pulp, 5744 and 6448; shingles, 3644 and 4047; pine deals, 1250 and 1574; spruce and other deals, 9677 and 10,340; logs, 1079 and 824.

The larger fishery exports: canned salmon, 6306 and 6288; dry salted codfish, 5418 and 5827; canned lobsters, 2672 and 3639.

By principal countries, imports for consumption and total exports have been valued as follows for fiscal years, in thousands of dollars:

	Imports		Exports	
	1916	1917	1916	1917
United States.....	398,694	677,632	320,225	486,871

Australia.....	3,423	762	7,773	6,577
Belgium.....	59	15	336	666
Germany.....	86	14	....	....

The foregoing table includes coin and bullion. Imports of coin and bullion from the United States and exports thereto in the fiscal year 1916 were \$28,197,146 and \$103,555,818 respectively; in 1917, \$13,411,963 and \$196,291,917.

**SHIPPING.** Vessels entered, including those employed in the coasting trade, numbered 132,304, of 65,357,422 tons, in the fiscal year 1915, and cleared 126,888, of 61,346,713 tons; in 1916, entered 145,712, of 64,727,779 tons, and cleared 140,087, of 61,702,743 tons. The number of sea-going vessels entered in 1915 was 17,182, of 13,132,944 tons, and cleared 16,730, of 12,269,642 tons; in 1916, entered 19,146, of 12,616,927 tons, and cleared 18,616, of 12,210,723 tons. Of the latter tonnage, 5,911,826 tons were British, 1,985,098 tons Canadian, and 4,313,799 tons foreign.

**COMMUNICATIONS.** Canada has a system of canal, river, and lake navigation over 2700 miles long. Vessels from ports on the Great Lakes reach the Atlantic without breaking bulk. In 1916, 29,802 vessels, of 20,499,868 tons, passed through the canals, carrying over 263,648 passengers and 23,583,491 tons of freight. The total length of steam railway in operation, June 30, 1916, was 37,434 miles, as compared with 35,582 miles in 1915, 21,104 in 1909, and 17,657

in 1900. The 1915 and 1916 mileage was distributed as follows: Ontario, 10,702 and 11,320; Saskatchewan, 5327 and 5378; Quebec, 4677 and 4733; Manitoba, 4498 and 4309; Alberta, 3174 and 3894; British Columbia, 3100 and 3604; New Brunswick, 1962 and 1957; Nova Scotia, 1367 and 1436; Prince Edward Island, 275 and 275; Yukon Territory, 102 and 102; in the United States, 398 and 426; total, 35,582 and 37,434. The mileage given as being in the United States relates entirely to lines which cross American territory in passing from one point to another in Canada and which are operated wholly for the purposes of Canadian traffic. There is a large additional mileage in the United States which is owned and operated by Canadian railways. In the fiscal year 1916, gross railway earnings were \$261,888,654, and working expenses \$180,542,259; in 1915, \$199,843,072 and \$147,731,099; in 1914, \$243,083,539 and \$178,975,259. In 1916, the freight carried was 109,659,088 tons, and the earnings therefrom \$184,099,887; the number of passengers was 49,027,671, earnings therefrom \$66,763,261.

During 1917, the gross earnings of the Canadian railways were the largest on record exceeding the total of \$263,527,157 over the previous record year of 1916. For the three largest lines the Canadian Pacific, the Grand Trunk and the Canadian Northern, which normally represented about 80 per cent of the total railway business of the Dominion, the gross returns ended June 30, 1917, amounted to about \$230,000,000, and on this basis the gross earnings for the year were estimated to exceed \$285,000,000. This figure should be compared with \$146,738,214 for 1907 and \$52,353,276 for 1897. In the latter year the gross earnings per mile amounted to \$3163, while by 1917 they had increased to about \$7300. In 1897 there were 16,550 miles of railway in operation in the Dominion and by 1917 there was an estimated total of about 38,800 miles. A Royal Commission appointed by the government spent considerable time in the latter part of 1916 and the early part of 1917 in an inquiry into the railway situation in Canada. The recommendations in the report of this Royal Commission which consisted of Sir Henry L. Drayton and W. M. Acworth, and A. H. Smith, president of the New York Central, who submitted a separate report, were not acted upon by the government. In August, 1917, by act of parliament, the entire Canadian Northern including express, telegraph, steamship, elevator, and other subsidiary interests was taken over by the government which assumed the liability and agreed to pay for the stock, the value to be assigned by the Board of Arbitration; actual possession was to come after the arbitration proceedings. In 1917, government ownership in Canada embraced the 2002 miles of National Transcontinental which had been built as the Moncton-Winnipeg section of the Grand Trunk Pacific with the Intercolonial with 1553 miles, the Prince Edward Island Railway with 275 miles, and the Canadian Northern with 9600 miles, making a total of 13,430 miles to be owned and operated by the government. Naturally, during the year, there was a minimum of construction and 206.5 miles of track by six companies was the record. The largest piece of new line was 73.3 miles on the Edmonton-Dunvegan and British Columbia railway in Alberta, the Ca-

nadian Northern building an aggregate of 92.3 miles of new track, while the Grand Trunk and the Canadian Pacific railways carried on improvements at their terminal at Vancouver. The Toronto Union Station was about 55 per cent nearing completion. In April, 1917, the tunnel of the Canadian Northern Railway through Mount Royal at Montreal was placed in operation.

The Minister of Railways and Canals for the Dominion of Canada stated in his annual report for the year ended March 31, 1917, that rails had been laid on all but ninety-two miles of the 424-mile Hudson Bay R. R. The part unfinished was between the second Nelson River crossing and Port Nelson. All but eleven miles of this had been graded, and it was reported that rails would be laid to Port Nelson. Of the estimated cost of \$26,000,000 for the railway and the harbor, \$18,175,000 had been spent. Work on the harbor was cut down on account of war conditions.

The telegraph systems consist of lines owned and operated by the Dominion government and lines owned and operated by railway and telegraph chartered companies. The total length of line in 1914 was 46,333 miles, of which 10,356 miles were government and 45,977 miles companies'. The latter figure represented 184,602 miles of wire. Government line in 1915, 11,497 miles; in 1916, 11,843 miles. In 1915, the government maintained fifty-nine radiotelegraph stations.

Post offices on March 31, 1916, numbered 13,057, as compared with 13,348 in 1915, 13,811 in 1914, 14,178 in 1913, and 9627 in 1900. Postal revenue in 1916 was \$22,739,699, and expenditure \$19,890,427.

**FINANCE.** The standard of value in Canada is gold. The monetary unit is the dollar, equivalent to the American dollar. The system of public finance includes a consolidated fund and miscellaneous accounts. To the consolidated fund are paid in the revenues, and out of it are paid the expenditures, properly relating to the fiscal year, which ends on March 31. The miscellaneous accounts deal with loans, debt-redemption, railway administration, capital expenditure on public works, etc. The revenue exceeded \$100,000,000 for the first time in 1909-10, and in 1916-17 for the first time it exceeded \$200,000,000.

In his budget speech on April 24, 1917, the minister of finance stated that during the fiscal year 1916-17 the revenue had enabled the country to pay from income all current and capital expenditure, all interest charges upon the increased national debt, and all pension outlays, and, in addition, to devote the sum of \$60,000,000 to payment of the principal of the war expenditure.

The total expenditure and the total receipts of the Dominion government are shown in the table below for fiscal years. The several items are indicated as follows: *a* expenditure chargeable to consolidated fund; *b*, expenditure chargeable to capital; *c*, railway subsidies; *d*, other charges; *e*, total disbursements; *f*, revenue on account of consolidated fund; *g*, other receipts; *h*, total receipts; *i*, difference between receipts and disbursements; *j*, sinking funds; and *k*, net difference between receipts and disbursements (that is, the net excess of disbursements).

	1914	1915	1916	1917
	\$	\$	\$	\$
a	127,384,473	135,523,207	130,350,727	148,599,343

j	1,371,428	1,645,812	1,773,021	1,471,697
k	21,695,224	118,379,232	165,780,088	264,269,397

In the foregoing table, it may be noted that item *d* ("other charges") shows an extraordinary increase, from \$2,640,162 in the fiscal year 1914, to \$339,702,502 in 1917. This increase is in consequence of expenditure on account of war appropriation. This expenditure (which is exclusive of militia expenditure) amounted to \$60,750,476 up to March 31, 1915; in the fiscal year 1916, \$166,197,755; total up to March 31, 1916, \$226,948,231.

Main heads of revenue and expenditure on consolidated fund account are shown below for fiscal years, in thousands of dollars:

	1914	1915	1916	1917
<b>Revenue:</b>				
Customs .....	104,691	75,941	98,649	184,044

\* Includes charges of management, interest, sinking funds, and premium discount and exchange.

† Expenditure from income. ‡ Deficit.

The public debt of the Dominion on March 31, 1917, was \$1,382,003,268; assets, \$502,816,970; net debt, \$879,186,298, as compared with \$615,156,171 in 1916, \$449,376,083 in 1915, and \$335,996,850 in 1914. Interest on the debt: in the fiscal year 1917, \$35,802,567; in 1916, \$21,421,585; in 1915, \$15,736,743; in 1914, \$12,893,505. On the basis of an estimated population of 8,361,000, the net debt on March 31, 1917, represents \$105 per capita, there being an increase of \$62 per capita over 1914. The net debt in 1917 showed an increase of \$543,189,448 over 1914, this increase being due to the great war.

**GOVERNMENT.** The legislative power of the Dominion is exercised by a parliament of two chambers, the Senate and the House of Commons. The ordinary legal duration of a parliament is five years, but the duration of the 12th Parliament was extended a year by Act of the British Parliament of June 1, 1916. The 12th Parliament dates from October 7, 1911, the date of return of election writs; it opened November

15, 1911, was prorogued September 20, 1917, and dissolved October 6, 1917, having thus lasted for six years, or longer than any previous parliament of the Dominion. Senators, nominated for life by the governor-general, numbered 87 in the 12th Parliament; in the 13th Parliament they number 96. Members of the House of Commons are elected by direct male suffrage for the duration of Parliament. In the 12th Parliament their number was 221; in the 13th Parliament it is 234, apportioned as follows: Ontario, 82; Quebec, 65; Nova Scotia, 16; Saskatchewan, 16; Manitoba, 15; British Columbia, 13; Alberta, 12; New Brunswick, 11; Prince Edward Island, 3; Yukon Territory, 1.

The executive authority is vested in the King of Great Britain and Ireland and is exercised in his name by a governor-general (appointed by the crown) and privy council, or ministry, responsible to the House of Commons. The governor-general in 1917 was Victor Christian William Cavendish, Duke of Devonshire, who was appointed August 19, 1916, and assumed office November 11, 1916, in succession to Prince Arthur, Duke of Connaught and of Strathearn, who assumed office October 13, 1911.

**MINISTRY.** The Conservative ministry (the ninth Dominion ministry) of Sir Robert Laird Borden, which succeeded the Liberal ministry of Sir Wilfrid Laurier October 10, 1911, became a coalition ministry on October 12 when five Liberals took places in the cabinet. This ministry was composed as follows in 1917 (dates of appointment are here given in the case of members who entered the ministry after October 10, 1911): premier and president of the privy council, Sir Robert Laird Borden; president of the privy council, Newton Wealey Rowell\* (October 12, 1917); minister of trade and commerce, Sir George Eulas Foster; minister of the interior, Arthur Meighen (October 12, 1917), succeeding Dr. William James Roche (October 29, 1912); minister of public works, Frank B. Carvell (October 13, 1917), succeeding Charles C. Ballantyne\* (October 3, 1917), succeeding Robert Rogers (October 29, 1912); minister of railways and canals, Dr. John Dowsley Reid (October 12, 1917), succeeding Francis Cochrane; minister of finance, Sir William Thomas White; postmaster-general, Pierre Edouard Blondin (January 8, 1917), succeeding Thomas Chase Casgrain (October 20, 1914; died December 29, 1916); minister of marine and fisheries and of the naval service, Charles C. Ballantyne (October 13, 1917), succeeding John Douglas Hazen; minister of justice, Charles Joseph Doherty; minister of militia and defense, Major-Gen. Sydney C. Mewburn\* (October 12, 1917), succeeding Sir Albert Edward Kemp (November 23, 1916), succeeding Lieut. Gen. Sir Sam Hughes; minister of overseas forces in the United Kingdom, Sir George Hasley Perley (October 31, 1916); secretary of state and minister of mines, Martin Burrell (October 12, 1917), succeeding Arthur Meighen (August 25, 1917), succeeding Esioff Léon Patenaude (January 8, 1917), succeeding Pierre Edouard Blondin (October 6, 1915); minister of labor, Thomas Wilson Crothers; minister of immigration and colonization, James A. Calder\* (October 12, 1917), minister of inland revenue, Albert E. Sévigny (January 8, 1917), succeeding Esioff Léon Patenaude (October 6, 1915); min-

\* Liberal.

ister of customs, Arthur L. Sifton\* (October 12, 1917), succeeding Dr. John Dowsley Reid; minister of agriculture, Thomas A. Crerar (October 12, 1917), succeeding Martin Burrell; ministers without portfolio, A. K. MacLean (October 23, 1917) and G. D. Robertson (October 23, 1917). The foregoing ministers constituted the cabinet. The following were also members of the ministry but not of the cabinet, in 1917: solicitor-general, Hugh Guthrie\* (October 4, 1917), succeeding Arthur Meighen (June 26, 1913); parliamentary secretary of militia and defense, Franklin B. McCurdy (July 19, 1916); parliamentary under secretary of state for external affairs, Lieut. Col. Hugh Clark (October 26, 1916). The premier of the 8th Dominion ministry, Sir Wilfrid Laurier, continued in 1917 as leader of the opposition.

Each of the Canadian provinces has an elected legislature, a lieutenant governor (appointed by the governor-general), and a responsible ministry.

#### HISTORY

**CONSCRIPTION** The question of the draft was the chief political issue of the year. Sir Robert Borden announced in May that he had determined to introduce compulsory military service. According to official figures given out at that time there were 136,400 Canadians in France and 180,000 in England, and the losses totalled 100,000. On June 11 the conscription bill was introduced. Sir Robert Borden in introducing it gave figures which estimated the number of available men in Canada between twenty and thirty-four years of age at over one million. He declared that there was no new principle in the measure for it was based upon the statute which had been the law of the land since 1868. To secure united support for it he appealed to Sir Wilfrid Laurier to cooperate in forming a coalition cabinet but the latter refused. Sir Wilfrid Laurier criticized the government for introducing a measure to which it had declared it would never resort. If there was a lack of harmony in Canada it would be the government's fault. He argued that under the present laws the government had no power to send forces outside Canada, nor had Parliament any right to make such a serious change in the law without the consent of the people. He desired an election in order that the people should decide. He said there were already forty-eight parliamentary vacancies and this remnant of the original Parliament could not be regarded as in any sense representative. Before introducing such a measure the government should have carried on campaigns of education as the English government had done; whereas its present course was bringing about a division between races and classes. He said that French Canadians had not enlisted as they ought to have done and that no one regretted it more than he, but that the remedy would have been an appeal to the country. There was much comment on Sir Wilfrid Laurier's speech. Official figures were published on June 15 showing the number of French Canadians enlisted. From Quebec there were 6979 as against 22,000 English-speaking men. Although the English-speaking men formed only one-sixth of the population they made up 75 per cent of the enlistments. In the West the French Canadians furnished 5904 although the French Canadians outside

Quebec were only one-sixth of those in the province. In certain French Canadian papers the opposition to the government went so far as to demand separation; that is to say, the creation of a new province of lower Canada which should be governed by the French Canadian majority and which should be directly subject to the crown. The bill provided for reinforcements up to 100,000 men from ten classes, the age for service being from twenty to forty-five. It was carried in its second reading on July 8 by 118 votes against 55. Sir Wilfrid Laurier's proposed amendment for a referendum which was supported by the whole Quebec delegation being defeated by 111 to 62. It passed the Lower House on July 24, and the Senate early in August. In the Senate it won after a sharp debate and with a rather narrow majority (54 to 39). Seven French Conservatives voted for it and two French Conservatives voted against it. Nine English-speaking Liberals, including the Liberal leader, Senator Bostock, voted for it. An amendment to the effect that the bill should not be enforced until after the elections was defeated by ten votes. At about the same time a meeting was held at Toronto under the name of the "Win the War" convention, consisting of eight hundred delegates. Speeches were made demanding a union of parties to enforce conscription and the continuance of Sir Robert Borden in office. The convention passed a resolution in favor of a national government, conscription, sufficient taxation of war profits, three month's home leave for soldiers in France with increased pay, and against a general election during the war.

**OPPOSITION TO CONSCRIPTION.** Meanwhile a violent opposition to the measure had developed, especially among the French Canadians. In July there was rioting in Montreal. At an anti-conscription meeting there a Liberal labor member of parliament, Mr. Verville, having declared that many Canadian soldiers were retained in England in order that their physical condition might not be known in Canada, was interrupted by Colonel Rexford, formerly in command of an over-seas battalion, who denied the charge. Attempts were made to seize Colonel Rexford, and he was taken away under the protection of the police. Stones were thrown at his car in passing. At another meeting in the city of Quebec violent speeches were made by political leaders. Mr. Laverge declared that if Canadians were to be drafted their only choice was between dying in Europe or dying in Canada and as for him, he preferred to fall on Canadian soil. After the meeting the mob attacked two of the newspapers which supported conscription. At a meeting at Hull Mr. Watters, president of the Dominion labor congress, denounced Sir Robert Borden for breach of faith in not consulting organized labor before bringing in the conscription bill; and characterized Mr. Lloyd George as one of the trickiest politicians that ever disgraced humanity. It was reported that Sir Wilfrid Laurier had notified the prime minister that he should not be able to keep his followers in check if conscription were brought in without consulting the people. Sir Lomer Gouin, prime minister of Quebec, declared himself in favor of an immediate appeal to the people and opposed to an extension of the parliamentary term.

At the Winnipeg convention early in August

the Liberals of the four western provinces confirmed their choice of Sir Wilfrid Laurier as leader and attacked the Borden government. A war resolution was passed to the effect that it was the duty of the people to support the vigorous prosecution of the war; to maintain the forces at the front and supply the necessary reinforcements; to provide for the organization of the production of food, munitions, and other war necessities with the greatest possible efficiency; to put an end to profiteering either by nationalization of industry or by controlling establishments; finally that the Canadian government confer with the British authorities to ascertain the nature of the services that could best be rendered by Canada. An amendment to the effect that compulsion should be introduced if necessary to secure reinforcements was rejected by an overwhelming majority. There was some evidence throughout the West that a good many western Liberals did not accept this policy.

After the bill was passed, however, Sir Wilfrid Laurier declared that while he himself was opposed to it in principle he would support it now that it had become law. The French element in the Liberal party became more and more threatening in their opposition. Toward the end of August a general strike was called in Montreal but it failed and an attempt to hold an enormous mass meeting was also a failure, but on August 29 a mass meeting of 5000 people was held in that city and when the police tried to break up a procession after the meeting they were driven back with stones. One of the speakers at the meeting went so far as to say that if the conscription went into effect Sir Robert Borden and the members of the government should die; and another declared that if he were arrested for speaking against conscription he was sure he would be rescued from jail. In Quebec the French press of all parties urged that the enforcement of conscription should be deferred until after the election.

**COALITION GOVERNMENT.** After the Winnipeg convention the western Liberal leaders, while refusing to enter a coalition government under Sir Robert Borden, declared that they favored a national rather than a party government and were willing to take office under Sir George Foster, and others whom they named. On August 29 Sir Robert Borden announced this fact to a caucus of the party and offered to resign, but Sir George Foster refused to accept the responsibility of forming a government and declared his belief that it was necessary that Sir Robert Borden should continue in office. These views were supported enthusiastically by the caucus and the western Liberals were informed of the result. On October 12 a coalition government was formed under Sir Robert Borden. Five Liberals took their places in the cabinet. An inner war cabinet was planned after the British model to consist of seven members, of whom four were Conservatives and three Liberal. The composition of the new cabinet has been given above.

The Liberals who joined the government represented Ontario, Alberta, Saskatchewan, New Brunswick, and Nova Scotia. Sir Wilfrid Laurier was not included and as he still had a large following there was much speculation as to what his course would be. Thus Sir Robert

Borden's long struggle to bring about coalition at length succeeded. There had been strong opposition and when the Winnipeg Convention of western Liberals repudiated coalition and when Liberal leaders said if it were possible at all it could only be on condition that he withdrew from the leadership the prospects seemed dark. He had at once declared that he would withdraw (as noted above), but this was not permitted by his party and even some of the Liberals were opposed to it. The cause of coalition gradually gained ground. It was generally assumed that the new cabinet was assured of so strong a majority at the coming general elections that they could proceed without question and while Quebec was bitterly opposed to conscription it seemed probable that if a large majority favored it, Quebec would present no obstacle.

The government's programme as stated by Sir Robert Borden after the formation of the new Union government included the vigorous prosecution of the war, the immediate enforcement of the military service act; universal woman suffrage; sufficient taxation of war profits and the prevention of excessive profits; increased taxation of incomes; improvement of transport facilities; coöperative management of several railway systems; development of ship-building; encouragement of settlement on land; increased production and coöperation in agriculture, and in general the development of the resources of Canada.

Changes aiming at a more concentrated organization during the war were announced on October 24. These were to consist in: (1) A war cabinet, and (2) a reconstruction and development committee, each to be composed of ten members, and both together comprising all the members of the ministry and each to have the prime minister as its chairman. Unlike the British system in which the war cabinet of five was supreme while the large body of ministries was subordinate the Canadian system consisted of two divisions on the principle of joint responsibility.

**WAR TIME ELECTION MEASURES.** Important franchise measures had been carried by the government toward the close of the parliamentary session. One of these bestowed the suffrage to the troops of the Canadian expeditionary forces, including those who had not been Canadian residents when they enlisted, and bestowed it also on Canadian nurses in military hospitals. Another, the War Time Election Act, disfranchised natives of enemy countries who had been in Canada less than fifteen years and also the Mennonites and Doukhobors who had come to Canada under guarantee of immunity from military service. Furthermore, it gave the vote to the widows, wives, mothers, and sisters of soldiers, the number of women thus enfranchised being estimated at 500,000. The new franchise measures were defended by Sir Robert Borden on September 10 on the principle that they were service measures; that aliens as they were not called upon to fight should not receive the franchise; that the vote for the female relatives of soldiers was only fair as they had made the greatest sacrifice, and that, moreover, thousands of soldiers being unable to vote, it was right that the women related to them should have the privilege. The measures were vigorously opposed by Sir Wilfrid Laurier who

objected especially to the denial of the vote to aliens who had been naturalized since 1902. He contended that even if they were Germans or Austrians they had left their lands on account of tyranny and surely would not turn traitor to the country which had given them their freedom, and he pointed to the United States which, with a far greater relative number of Germans than Canada, had passed no such legislation. The effect of the measure would really be to disfranchise Slavs and Ruthenians for of the pure Germans few had come to Canada. The government advocates argued that to allow persons hampered by a doubtful or double loyalty to have a voice in the policy of the country in this crisis was well-nigh treasonable, and they taxed the Liberals with counting on alien support at the polls.

**ELECTORAL CAMPAIGN.** As the election approached the issues were outlined in speeches by Sir Robert Borden and Sir Wilfrid Laurier. The former characterized the Military Service Act as a military measure which called the rich as well as the poor to the colors and in fact bore more heavily on the rich since it was harder to claim exemption on the ground that their labor was needed at home. An army of over 400,000 men had been raised by voluntary enlistment (which at the same ratio in the United States would have raised 5,000,000) and of these 350,000 had gone over sea. The conscription measure had been introduced only when it was found that voluntary enlistment was no longer sufficient. Sir Wilfrid Laurier was received with enthusiasm at the first meeting of the campaign in Quebec, where he had been a candidate for the first time exactly forty years before. He said that the war was the dominant question which dwarfed every other issue. The actual invasion of Canada was not to be feared but it was to be feared that the Power which had violated every law would dominate the world. The Premier of Quebec, Sir Lomer Gouin, in a speech that followed, said that the French Canadians were not afraid of isolation. That there was no power in the world to impose conscription on the Canadian people against their will. He declared that if conscription was approved by the people of Canada he would accept it and support it. As the campaign went on it seemed that the Liberal forces in Quebec were gaining in strength. The date of the election was fixed for the middle of December. While the government that asked for popular confirmation was still the government of Sir Robert Borden it contained Liberal as well as Conservative leaders. Opposed to it were the Liberals under the leadership of Sir Wilfrid Laurier who still objected to an alliance with the Conservatives, and the Nationalists under Mr. Bourassa, who consisted of the thoroughgoing French-Canadian opponents of conscription. The issue was perfectly clear: Sir Wilfrid Laurier stood for voluntary service; Sir Robert Borden declared that the voluntary service had failed and that compulsion was necessary now.

More specifically the programme of Sir Wilfrid Laurier was as follows: In the first place, he said that to introduce conscription without a previous educational campaign was a grave mistake. Another criticism of the government's plan was that, while it drafted human life, it did not draft the wealth and resources and

services of those who were over the military age. If the Liberal party were returned to power he said his policy would be to go no further with the Conscription Act until the people had had a chance to pronounce upon it by referendum. He pledged himself to submit it to the people and carry out their decision. He declared that he would make a strong appeal for voluntary recruiting and he pointed to the example of Australia. He attacked the War-time Election Act disfranchising aliens. As to economic issues, he said he would remove the war duty of  $7\frac{1}{2}$  per cent of the general tariff and the 5 per cent on British goods. Other features of his policy were free agricultural implements for the western farmers; control of food-producing factories, allowing a fair interest on investment, and the suppression of profiteering. At the end of October it was announced that a petition had been entered in the superior court of Montreal to have the Military Service Act declared unconstitutional.

**GENERAL ELECTION.** The election held on December 17 gave the Unionists a majority in Parliament of about fifty over the old Liberal party. Quebec was almost solidly for Sir Wilfrid Laurier, and the Liberals gained some seats in the Maritime Provinces, and a few in Ontario, but the west, with the exception of Alberta, which was about evenly divided, gave the government a strong majority. The women's vote, under the new franchise measure mentioned above, appeared to have been for the most part cast for the government. At the close of the year the returns from the soldiers at the front were not known but it was not supposed that they would change the result. Thus the Unionists had a safe majority, but the Liberals, who still followed Sir Wilfrid Laurier, together with those Liberals known as Liberal Unionists, who supported the coalition government, had a membership of 133 out of the 235 in the House. Thus the old Conservatives were in the minority and the Liberal Unionists held the balance of power. The latter stood behind the government in the matter of conscription but might at any time break away and join the old Liberal element if the government did not make good the pledges in its programme. The situation at the close of the year seemed difficult, for not only was national sentiment in Quebec violently opposed to taking part in the war, but the Liberals of the Province were equally opposed to conscription and in the election they had gained sixty-two out of sixty-five seats. Moreover, only about half of the men required to register under the Military Service Act had done so and about 90 per cent of these had applied for exemption. If the government attempted to enforce rigidly the terms of the draft it apparently would run the risk of causing a rebellion in Quebec, which comprised a quarter of the whole population of the Dominion, that is to say, about 2,000,000 inhabitants, of whom 1,600,000 were French. On the other hand, if it did not enforce the draft in Quebec the success of its political campaign seemed to be meaningless.

The election elicited much bitter comment, especially from the newspapers in the French language. Some of them lamented the break it revealed between the west and the east and blamed the extreme nationalists, as represented by M. Bourassa, for having misstated the aims

of Great Britain and injected the race issue into the campaign. A French Canadian deputy introduced in the Quebec Provincial Parliament the following resolution: "That this House is of the opinion that the Province of Quebec would be disposed to accept the rupture of the Federation pact of 1867, if in the opinion of the other provinces it is believed that the said province is an obstacle to the union and the progress and the development of Canada."

**OTHER EVENTS.** At the close of 1916 the revenue of Canada was in advance of the receipts for 1915. The favorable balance of trade which in 1915 was \$203,582,071, was increased at the beginning of 1916 by \$122,000,000, the figures being \$1,091,706,403 exports, \$776,726,991 imports, \$324,979,412 balance. The exports that were classed as agricultural products fell for the first time in many years to second place; the exports classified as manufactures, taking the first place. On January 10 an issue of war-saving certificates was announced. These were redeemable within three years in denominations of \$25.00, \$50.00, and \$100.00 each and could be obtained at any bank or postal money order office at the price of \$21.50, \$43.00, and \$86.00 respectively. On February 1 the Canadian Parliament unanimously voted a war credit for the coming year of \$500,000,000. Sir Robert Borden had estimated the cost for the coming fiscal year as \$443,274,000. On March 12 the third Canadian domestic war loan for \$150,000,000 in 5 per cent twenty year bonds at 96 was placed on the market. This was oversubscribed. The previous war loans for \$45,000,000 and \$100,000,000 respectively had been subscribed for twice over. The total subscriptions amounted to \$250,000,000, of which \$190,000,000 came from the public and \$60,000,000 from the banks. On April 24 the finance minister, Sir Thomas White, declared that by the end of the year the national debt might reach \$1,500,000,000 on account of increased war expenses. On July 25 the House voted a four per cent income tax, with a graduated super-tax of 2 to 25 per cent. On November 12 the campaign for the Victory Loan, amounting to £30,000,000, was begun throughout the Dominion. Thousands of business houses suspended their work and used their advertising space in the newspapers for appeals on behalf of the loan.

In Canada in 1917 food control was still far behind the point at which it had been carried in Great Britain or in the United States, and the food controller, Mr. Hanna, who wished to take advanced measures, was the object of much criticism. Yet it appeared that if the food question were not taken up as vigorously in Canada as in Great Britain the rations of the soldiers at the front would certainly have to be cut down. Very drastic regulations were evidently needed.

On August 10 an attempt was made to blow up the country house of Lord Atholstan, owner of the Montreal *Star*, which had strongly supported conscription. Some arrests followed, and, according to the evidence, there had been a meeting at the store of one Eli Lalumière where it was agreed to murder Sir Robert Borden, Sir William Mackenzie, and others in the government, and to destroy the offices of four material newspapers, and that dynamite should be stolen from the Martineau quarries. The dynamite was said to have been stored at the house

of one Tremblay, whence it was taken in a motor car to Lord Athelstan's.

See AGRICULTURAL CREDIT; ARBITRATION AND CONCILIATION, INDUSTRIAL; FINANCIAL REVIEW.

**CANALS.** The congestion on the railway systems and the great amount of transportation incidental to the war attracted increased attention to the canals and inland waterways of both America and Europe. In the United States, with a few notable exceptions, such as the New York State Barge Canal and the canalization of certain western rivers, there had not been developed in recent years any consistent policy for extending or even utilizing the canal systems, and as a result the inland waterways were not in a position to afford the relief needed. Nevertheless, during the year, efforts were made to construct barges of steel, wood, and concrete, and some of the larger corporations expressed their intention of developing their own fleets of barges for this purpose.

Late in the year the United States Department of Commerce reported that thousands of tons of freight were being carried by river barges, and that new terminals were under construction at Memphis, Nashville, St. Louis, Peoria, St. Paul, and Minneapolis, while improvements were being made at New Orleans, Montgomery, and Mobile. The government barges used on the Mississippi were supplemented by steamers under the jurisdiction of the Department of Commerce, and the authorities of New York State had requested the operation of government barges on the new New York State Canal. The United States Steel Corporation had under construction a fleet of seventy barges for use on the upper Ohio and Monongahela rivers, while a fleet of twenty-four barges of 2000-ton capacity and four tow barges were being built for use from St. Paul to St. Louis. The Alabama rivers were carrying a large amount of foodstuff in barges and the same was true of other southern waters.

**NEW YORK BARGE CANAL.** On June 27, 1917, occurred the centennial anniversary of the signing of the first contract for the construction of the Erie Canal, while on July 4, 1817, actual construction of the waterway was begun by former excavation just west of Rome. It was the centennial year that marked the virtual completion of the New York State Barge Canal, and its promise of future usefulness was due rather to the extraordinary conditions developed by the war than to its intrinsic merits or the provision that had been made for its utilization. In fact, at the end of the year, while the canal was virtually completed, there was an utter lack of boats, not merely a lack of large sized craft suitable for the increased dimensions of the canal, but of sufficient boats of any description. The congestion and shortcomings of the railways naturally drew considerable attention to the New York Canal as a means of forwarding bulk cargoes, and the Canal Board made recommendations through the legislature to the United States government asking that Federal aid should be given to boat building. It was believed that barges built by Federal authorities could be operated by the Shipping Board Corporation and thus relieve the railways between New York and Buffalo, a certain amount of whose traffic was water borne on the Great Lakes. The Canal Board proposed to build a grain elevator at the Gowanus

Bay terminal in New York Harbor and other improvements in connection with it were contemplated.

It was not until the end of the year, however, that any special effort was made by private corporations to build suitable barges. A boat-building corporation in northern New York determined to build for its own account four barges of 750 tons' capacity for traffic during 1918 on the Barge Canal. It also expected to build further contracts for operating concerns that were being organized. The General Electric Company which had extensive works at Schenectady along the route of the canal caused plans to be prepared for a special type of barge to carry its product from its factory to various branches and depots.

In November, just before the close of navigation, a practical test of the New York State Barge Canal was made by the passage of two submarine chasers from Oswego to Troy. These vessels were built on the St. Lawrence River and were 110 feet in length, 15½-foot beam, drawing 7 feet of water. They made the trip without difficulty and the various locks were found to work readily and rapidly.

**CANALS AT SAULT STE. MARIE.** The lake commerce passing through the canals at Sault Ste. Marie, Michigan and Ontario, in 1917, showed considerable decrease over that for 1916. In 1917, the registered tonnage amounted to 65,307,233 net tonnage as compared with 69,824,463 in 1916, while the freight actually carried in 1917 amounted to 89,813,898 short tons as compared with 91,888,219 short tons in 1916. The decrease in registered tonnage was 6 per cent and in freight 2 per cent in the two years compared. The United States canal was opened April 24 and was closed December 17, 1917, giving a season of 238 days, while the Canadian canal was opened April 25, and closed December 17, 1917, making a season of 237 days. During this period, 19,569 steamers, 1943 sailing vessels, and 1373 unregistered craft passed through as compared to 21,606 steamers, 2461 sailing ships, and 1340 unregistered craft in 1916, there being 14,611 lockages as compared with 16,190 lockages in 1916. The number of passengers for the year fell from 54,922 in 1916, to 38,339 in 1917, while the iron ore decreased from 63,452,107 short tons in 1916 to 61,374,090 short tons in 1917. Except in coal, which showed an increase for hard coal of from 2,210,219 short tons to 2,562,199 short tons in 1917, and lumber, which increased from 341,352 M. ft. B. M. in 1916 to 350,609 in 1917, there was a decrease in the amount of important commodities handled. Wheat fell from 226,063,315 bushels to 185,899,449 bushels in 1917; grain from 93,189,561 bushels in 1916 to 67,423,980 bushels in 1917; copper from 126,043 short tons in 1916 to 118,182 short tons in 1917; manufactured and pig iron from 202,194 short tons in 1916 to 102,082 short tons in 1917; general merchandise from 1,049,020 short tons in 1916 to 1,491,714 short tons in 1917. Of the vessels passing through the canals 17,536 with a registered tonnage of 53,413,807 used the American canal and 5349 vessels with a registered tonnage of 11,893,426 used the Canadian canal in 1917. The United States canal handled the bulk of the freight, as 56,204,519 short tons passed through east bound, and 18,157,331 short tons passed through west bound, or a total of 74,361,850 short tons, while the

east bound freight on the Canadian canal was 13,841,966 short tons and the west bound freight was 1,610,082 short tons, or a total of 15,452,048 for the Canadian canal.

**LACHINE CANAL.** On the Lachine Canal of the St. Lawrence River, 70,921 tons more grain and miscellaneous cargo were carried by vessels passing through in the 1917 season, over what was carried in 1916. In 1917, there were more passengers, more vessels, more coal, more flour, and more sand carried than in 1916, but less grain and fewer agricultural products. The total combined tonnage for all the trips made through the canal amounted to 4,145,836, an increase over 1916 of 144,663 tons. The cargo tonnage was 3,335,943, while 69,910 passengers were carried.

**LAKE WASHINGTON CANAL.** The official opening of the Lake Washington Government Canal at Seattle, Wash., took place on July 4, 1917. As early as 1856, Gen. George B. McClellan, the United States engineer officer, had recommended to Jefferson Davis, Secretary of War, the construction of a waterway connecting Lake Washington through Lake Union with Puget Sound. In 1890, the United States government made a survey of such a route, and later the right-of-way was secured, and presented to the government. In 1910, the United States government appropriated \$2,075,000 to build the locks, and late in the following year the excavation was begun, through the cooperative action of the city, county, and State. The total cost of the canal was approximately \$5,000,000, including the right-of-way, and some 4,000,000 yards of excavation and dredging have been executed, and 320,000 yards of concrete used in lock and other construction. The Lake Washington Canal is entirely in the city of Seattle and extends from Puget Sound, through Shilshole and Salmon bays, and Lake Union to Union Bay, on the western shore of Lake Washington, a distance by channel of approximately eight miles. Aside from the locks, one of the most notable structures involved in the canal construction is the Fremont Ave. bridge, 242 feet long, between trunnions, and operated by four 100-horsepower Westinghouse motors.

**EUROPEAN CANALS.** Throughout Europe, the question of internal waterways during 1917 was indeed vital. With the overtaking of railways and motor transport, relief was sought in the use of the canals, and in both Germany and France these waterways were used to their full-cast capacity.

An extension of the French national canal system was being advocated, and ambitious plans were being put forward for new developments. From the early eighties of the nineteenth century down to 1917, there had been a normal increase in the use of the canals for general commerce, but this was confined to the main water lines where there was a minimum depth of water of 2 metres (6 feet 6 inches) and where the locks were 38.50 metres (126 feet) in total length, with a width of 5.20 metres (17 feet). By 1917, the main water lines had a total developed length of some 6000 kilometres (3700 miles), and they have carried 97 per cent of the total canal commerce of the country.

On the other hand, the smaller waterways had a total developed length of about 5300 kilometres (3280 miles) and were used principally for local traffic. On a few of the canal rivers

such as the Seine, the Havre-Tancarville, the Saône, Rhône, and Garonne, there were a few steam-driven cargo boats, but in the great majority of cases, the traffic was carried by small boats operated by the owners themselves.

It was proposed in 1917 to employ electric traction more extensively, but usually where this has been essayed, the attempt has been unsuccessful. Even for the transport of coal to Paris from the north, 75 per cent goes by rail and the remainder which was being carried in three-ton barges was greatly suffering from the decrease. Nevertheless, in many cases new and extended canals were being advocated.

**RHÔNE CANAL.** In June, a conference was held in Lyons composed of representatives of 11 departments of France in reference to the navigation of the river Rhône, and the proposed canal in connection therewith, using electricity as a motive power. This conference recommended that the new canal be commenced without waiting for the end of the war, and also that in the development of water power of the upper Rhône sufficient current should be reserved to furnish power for the navigation of the Rhône and the canal. The project discussed also comprised the irrigation of land between Lyons and Marseilles. It was an interesting fact that this project was a portion of the great canal improvement prepared as far back as 1878 by M. de Freycinet.

**THE CANAL DU NORD.** The Canal du Nord in 1917 was so overburdened with war traffic that it could carry no more, but this was the case before the war with the water route from Paris to the Lille district. This canal was the best of the French waterways and was 70 ft. wide and 8 ft. deep, having 19 locks with an average lift of 20 ft. The Canal du Nord when completed would have cost nearly £3,000,000 (\$14,580,000) and provisions were made in the scheme of improvement for electric towage.

**BRITISH CANALS.** The canal question in Great Britain during the year 1917, as elsewhere, attracted attention. The Canal Control Committee thought the canals should be used to relieve the railways and steps were being taken to provide additional crews for the canal boats. On some of the canals, however, the decrease in tonnage continued and it was universally recognized that the British canals were in far less efficient shape than those on the continent of Europe. This was in part due to neglect of the proper maintenance of the canals, but more to natural difficulties, as but 1482 miles out of a total of 4053 miles of navigable inland waterways in Great Britain were of natural river, whereas in France out of a total of 7006 miles 4392 miles were natural, and in Germany out of 7038 miles, 5815 miles were natural. Any improvement of the British canals would involve not merely canalization of rivers, but actual excavation, and at the same time, owing to the configuration of the country, there would be considerable construction of locks. Consequently, while some authorities advocated canal improvement, there were a number of engineers who believed that Government funds rather should be spent on the improvement of railways and roads, so that the latter might be able to take care of the increased motor truck traffic.

**MID-SCOTLAND CANAL.** In Great Britain, two Mid-Scotland Ship Canal schemes were under consideration during the year and a Government committee had under investigation the question

as to which route would be the more feasible. One route proposed was by way of Loch Lomond, while plans were in course of preparation for an alternative project by Bonny and Kelvin. The need for a waterway connecting the Clyde and the Forth was first proposed by Daniel Defoe in 1724, and various engineers subsequent to that time suggested such a connection. In the meantime a small barge canal was built which in its early days was a very successful enterprise. In 1890, it was proposed to parallel this barge canal along the Kelvin Valley by a ship canal and various plans were put forward for such a project. This was known as the "Direct Route," and just before the war the estimated cost for such a canal was calculated at about £24,000,000. This "Direct Route" from Grangemouth to Clydebank involved a distance of 30.5 miles.

The Loch Lomond Route started from the Forth just north of Grangemouth and utilized the valley of the river as well as the open water in Loch Lomond and Loch Long, so that there would be 30 miles in canal and 21 miles in the two lakes, making a total distance from Grangemouth to Clydebank of 85.5 miles. The "Direct Route" would be practically at sea-level, but in the case of the Loch Lomond Route, a height of about 20 feet above high water in the Clyde would have to be surmounted, and locks built for that purpose. The level of the Loch Lomond Route would be about 31 feet above low water in the Forth. Both plans were under consideration by the Admiralty and other departments of the Government in 1917, and were considered projects for the future rather than for immediate decision.

**CANARY ISLANDS.** A group of islands off the northwest coast of Africa, constituting a province of Spain. Area, 7273 square kilometres (2808 square miles). The census of December 31, 1910, returned a population of 444,016; estimate of December 31, 1913, 469,768. The capital, Santa Cruz de Tenerife, had 63,004 inhabitants in 1910; Las Palmas, the most important town, had 60,338. Potatoes, bananas, onions, tomatoes, and nuts are exported. The values of Canary Island crops in 1916 were estimated by the Agricultural Society as follows, in thousands of dollars:

<i>Crop</i>	<i>1915</i>	<i>1916</i>
Bananas .....	2,821	2,765
Tomatoes .....	450	415
Potatoes .....	347	421
Wheat .....	418	624
Corn .....	60	111
Onion seed and onions.....	103	164
Filices (kid skins).....	40	65
Almonds .....	21	29
Cochineal .....	18	25
<b>Total.....</b>	<b>4,282</b>	<b>4,622</b>

Total imports 1916, \$11,598,567; 1915, \$14,650,326. Exports 1916, \$3,306,441. The effect of the war was felt severely in the decrease of ocean tonnage, all but neutral vessels being withdrawn from the ports at the close of 1916.

**CANCER.** The Bureau of the U. S. Census issued in 1917 a monograph compiling and analyzing, under twenty-nine separate headings, deaths from cancer in the registration area of the United States in 1914. The total number of deaths in that area for that year, from cancer and other malignant tumors, was 52,420, the

estimated population of this area being 66.8 per cent of the total population. As a result of investigation of reports as originally made to the bureau, the diagnosis of cancer was determined to be reasonably certain in 30,555 instances, or 56.3 per cent of the total; in 14,404, or 14.2 per cent, the diagnosis was classified as unknown. It is on this basis that the analysis of the cases was made. The increase in cancer in the United States was indicated by the mortality figures taken from the registration area as it existed in the several years mentioned, as follows: 1906, 29,020, a rate of 69.1 per hundred thousand of population; 1907, 30,514, rate 70.9; 1908, 33,465, a rate of 71.5; 1909, 37,562, a rate of 73.8; 1910, 41,039, a rate of 76.2; 1911, 44,024, a rate of 74.3; 1912, 46,531, a rate of 77.0; 1913, 49,928, a rate of 78.9; 1914, 52,420, a rate of 79.4. Of the deaths in 1914, it was said that 19,889, or 37.9 per cent, were due to cancer of the stomach and liver, and 8152, or 15.6 per cent, to cancer and other malignant tumors of the female genital organs.

**CANDIA.** See CRETE.

**CANNING** (OF FRUITS AND VEGETABLES). See HORTICULTURE.

**CANTONMENTS.** See CITY PLANNING; GARBAGE AND REFUSE DISPOSAL; MILITARY PROGRESS; SEWERAGE AND SEWAGE TREATMENT; WATER WORKS AND WATER PURIFICATION.

**CAPE COLONY.** See CAPE OF GOOD HOPE PROVINCE.

**CAPE OF GOOD HOPE PROVINCE.** One of the four original provinces of the Union of South Africa. Population according to the census of 1911, 2,564,965, of whom 582,377 were whites. In 1911 Capetown, the capital, had, with suburbs, 161,579 (85,442 whites); Capetown municipality had 67,159 (29,863 whites). Kimberley and Beaconsfield, 44,433 (17,507 whites); Kimberley municipality, 29,525 (13,598); Beaconsfield municipality, 14,294 (3404); Kenilworth, 614; Port Elizabeth, 30,688; with suburbs, 37,063 (20,007 whites); East London, 20,867; with suburbs, 24,606 (14,899 whites); Grahamstown, 13,830; Paarl, 11,018; Simons-town, 4751; Vryburg, 2461; Mafeking, 2296. Of the total population, Europeans form about one-quarter and the colored races three-quarters; one-fifth of the population is urban. Christians numbered 1,437,688, most of whom were Protestants; Roman Catholics, 35,934; Mohammedans, 24,189; Jews, 16,744. Returned as of no religion were 1,077,998, of whom 1,047,233 were natives. Of the total population, 1,735,491 (859,716 males) were unable to read or write. For area, production, and trade, see SOUTH AFRICA, UNION OF.

**CAPE-TO-CAIRO RAILWAY.** See CONGO, BELGIAN.

**CAPE VERDE ISLANDS.** A group of Portuguese West African islands, having a total area of 1516 square miles. Population (1912), 143,929. Imports and exports (1914), 2,023,653 and 295,768 escudos respectively. Capital, Praia.

**CAPRONI, GIANNI,** inventor of the Caproni airplane. See AERONAUTICS.

**CAPRONI BIPLANE.** See AERONAUTICS; MILITARY PROGRESS.

**CARAMEL.** See CHEMISTRY.

**CARDINALS.** See ROMAN CATHOLIC CHURCH.

**CARINTHIA.** A crownland and titular dukedom of Austria. To the west is Tirol, to the

east Styria; to the north Salzburg and Styria, to the south Venetia, Görz, and Carniola. The area is 3987 square miles, or about twice that of Delaware. Population December 31, 1910, 396,200, as compared with 367,324 in 1900; the estimated population in 1913 was 406,162. In 1910 the number of Austrian subjects was 387,072; of these, German was the vernacular of 304,287 (78.61 per cent); Slovenian, 82,212 (21.24 per cent). Catholics in 1910 numbered 371,333 (93.72 per cent); Evangelicals, 24,299 (6.13 per cent). Of the population in 1910, those dependent on agriculture (including forestry) constituted about 51 per cent; industry and the trades, 21.7 per cent; commerce and transportation, 11 per cent; public and military service and without vocation, 16.2 per cent. Carinthia has a remarkably high rate of illegitimacy; in 1912, out of a total of 12,846 births, 4735 were illegitimate. The capital is Klagenfurt, which in 1910 had 28,911 inhabitants. Carinthia has a unicameral diet of 43 members; it is represented in the lower house of the Austrian Reichsrat by 10 members.

**CARLISLE INDIAN SCHOOL.** See INDIAN TRAINING AND INDUSTRIAL SCHOOL.

**CARLSTROM, VICTOR.** An American aviator, killed May 9, 1917, at Newport News, Va., when an aeroplane that he was piloting collapsed and fell 3500 feet. Carlstrom was born in 1890 in Sweden, and for a time was a cowboy on a Colorado ranch. A week after he took up aviation he was appointed an instructor, and at the time of his death he was teaching an army student of the Atlantic Coast Aeronautical School. Shortly before, he had been commissioned a lieutenant in the United States Flying Corps Reserve. He received his license as an aviator from the Aero Club of America in 1912. Carlstrom was known as a skillful and also as a careful aviator. He had been in the public eye since November, 1915, when he flew from Toronto to New York, 600 miles, ascending at times to nearly 8000 feet and traveling on an average of 90 miles an hour. On April 19, 1916, he established an American record by ascending to 11,180 feet with two passengers, and another on April 30, when, with one passenger, he went up to 16,225 feet. A third record was his non-stop flight of 661 miles from Newport News to Sheepshead Bay, N. Y., with one passenger. One of his notable exploits was his flight from Chicago to New York, made on November 2 and 3, 1916. He failed to do this without stopping twice, but he covered the 967 miles in 8 hours, 28½ minutes, and made a new cross-country record, shortly afterward beaten by Miss Ruth Law, although Miss Law's total time between Chicago and New York was slightly the larger. His last 315 miles was covered at an average of 134 miles an hour. For this flight the Aero Club of America presented to Carlstrom a gold watch, and he also received, in the same year, the club's medal of merit and the Curtiss marine flying trophy.

**CARMAN, ALBERT.** A Canadian Methodist clergyman, educator, and administrator, died at Toronto, Ont., November 3, 1917. He was born in Iroquois, Ont., was educated at the Dundas Grammar School and Victoria University, Cobourg, where he graduated in 1855. He was appointed professor of mathematics in Albert College, Belleville, in 1857 and the following year became principal of the college. Through

his exertions the college was affiliated with Toronto University in 1860, received a university charter in arts in 1866, and in 1868 was created Albert University, with a charter in all the faculties, Carmon becoming its first chancellor. He was ordained a minister of the Methodist Episcopal Church in Canada in 1859, and was its Bishop in 1874-83. For some time previous to the latter year the organic union of the various Methodist denominations in Canada had been discussed, and after it had been accomplished in 1883, and the united body given the name of the Methodist Church, Carman became General Superintendent, an office which he held until 1914, after which he held the rank of Emeritus General Superintendent. In 1906 he made a tour of the world in the interest of missions. He was prominently identified with the founding of Alma Ladies' College, St. Thomas, Ont., and was appointed a senator of Toronto and Victoria universities and a governor of the Wesleyan Theological College, Montreal. Throughout his long career he was a consistent and uncompromising advocate of prohibition of the liquor traffic. He was considered the ablest administrator of the Canadian Methodist Church.

**CARNEGIE ENDOWMENT FOR INTERNATIONAL PEACE.** See INTERNATIONAL PEACE AND ARBITRATION.

**CARNEGIE FOUNDATION FOR THE ADVANCEMENT OF TEACHING.** See UNIVERSITIES AND COLLEGES.

**CARNEGIE INSTITUTE OF TECHNOLOGY.** A non-sectarian institution of learning, devoted primarily to the study of the natural sciences, situated at Pittsburgh, Pa. In the fall of 1917 there were 3159 students and 236 members of the faculty. Volumes in the adjacent Carnegie library, to which the members of the institute have access, numbered 350,000. Productive funds in 1917 amounted to \$9,500,000 and expenditures for the year 1916-17 to \$753,137. The institute was founded in 1909 by Andrew Carnegie. Beginning on July 1, 1918, the schedule will be conducted on a four-quarter year plan, as a war measure and to accelerate work. President, Arthur A. Hammerschlag, Sc.D., LL.D.

**CARNEGIE INSTITUTION OF WASHINGTON.** The sixteenth annual report of the president of the institution, Robert S. Woodward, covered the fiscal year ending October 31, 1917. It considered in a general way the work of the various departments and discussed the noteworthy events of the institution during the year, the relations between the institution and the public, the researches during 1917, the financial record, and the publications. One of the trustees, Isaac Wayne MacVeagh, died in Washington, January 11, 1917. As a trustee he rendered valuable service by discouraging an unwarranted optimism concerning the work of the institution, while at the same time giving valuable counsel, especially with regard to the legal and moral aspects of the proceedings of the Board of Trustees and of the Executive Committee.

During 1917 a new and probably final edition of the *Catalogue of Stars* by Ulugh Beg, the Arabian astronomer of the fifteenth century and the grandson of Tamerlane, was published. This work, second in importance only to the *Almagest* of Ptolemy, an edition of which was published in 1916 by the institution, was, like the *Almagest*, edited by Edward Ball Knobel, treasurer

and past president of the Royal Astronomical Society of London. There was also issued a *Concordance to the Poems of John Keats*, compiled by six editors assisted by twenty-four collaborators. The publication of the third volume of the *Researches of the Department of Terrestrial Magnetism*, taken in connection with the two previous volumes in the series, brings down to near the end of 1916 the results of the magnetic survey of the earth carried on by the department during the past ten years. The results were of great value and were immediately available as aids to navigation at a time when few data could be obtained from other sources. At the meeting of the Board of Trustees in December, 1916, the project of publication of the series of *Classics of International Law* was ordered to be transferred, together with the published volumes of the series on hand, to the Carnegie Endowment for International Peace; and the transfer was completed in 1917. The department of economics and sociology was discontinued by resolution of the trustees at their meeting of December, 1916. Three of the divisions of the department, however, had completed their reports, which were published during the last two years under the title *Contributions to American Economic History*.

Concerning the relations between the institution and the public, the report sets forth that the administrative office has had difficulty in dealing with the claims of the humanists, which were often conflicting, to a larger share of encouragement and support than could be given them; and also with the claims of those who, whether humanists or scientists, represent aberrant types of mind and as such lack the critical capacity to discern the limitations of the institution in granting aid, or mistake their own projects and suggestions for facts meriting scientific approval. The researches of the year proceeded without essential modification or limitations. There was an increasing public demand for the knowledge developed in the research departments and also for the men and methods essential to its production. As a result the institution has lost during the year some of its ablest men, who have joined commercial, educational, or other organizations. The activities of the division of research associates in 1917 were no less successful than those of the research departments.

The financial statement shows total receipts for the fiscal year amounting to \$1,425,594 and total appropriations of \$1,410,464. The grand total receipts to 1917 inclusive are \$14,433,327 and the appropriations \$13,973,614. During 1917 the Executive Committee authorized the publication of 25 volumes at an estimated cost of \$65,029. During the year 21 volumes were issued and 27 additional volumes were in press at the time the report was issued. Since the institution was founded there have been distributed by gifts to libraries and authors, and by sales, 165,888 volumes.

**CARNIOLA.** A crownland and titular dukedom of Austria. It is bounded on the north by Carinthia and Styria; on the east by Styria and Croatia; on the south by Croatia and Istria; on the west by Görz and Gradisca. Area, 3842 square miles. Population, according to the census of December 31, 1910, 525,995, as compared with 508,150 in 1900; the estimated population in 1913 was 530,189. In 1910 the number of

Austrian subjects was 520,327; of these, Slovenian was the vernacular of 490,978 (94.36 per cent); German, 27,915 (5.37 per cent). Catholics in 1910 numbered 524,846 (99.78 per cent). Of the population in 1910, those dependent on agriculture (including forestry) constituted about 61.9 per cent; industry and the trades, 17.5 per cent; commerce and transportation, 7.5 per cent; public and military service and without vocation, 13.0 per cent. The capital is Ljubljana, with 41,727 inhabitants in 1910. Carniola has a unicameral diet of 50 members and is represented in the Austrian Reichsrat by 12 members.

**CAROLINE ISLANDS.** See GERMAN NEW GUINEA.

**CAROLUS-DURAN, EMILE AUGUSTE.** A French painter and teacher, died in Paris, February 18, 1917. He was born July 4, 1838, in Lille, and his name was originally Charles Emile Auguste Durand. His parents were humble folk, but he was enabled to study in Lille under Souchon and later to go to Paris. There, in 1861, he won the Wicar prize, which made it possible for him to travel in Italy and continue his studies of the masters. He first attracted attention by two pictures, which were the fruit of his Roman sojourn—"The Evening Prayer" and "The Victim of Assassination." The latter, one of his best works, was exhibited at the Salon of 1866 and was bought for 5000 francs for the Museum of Lille. On the wings of this success he went to Spain, where he was greatly influenced by Velazquez, whose ardent disciple he became. Carolus-Duran's "Lady with Glove," a portrait of his wife, is one which made him famous and which he never surpassed. Another early work that attracted much notice was his equestrian portrait of his wife's sister, the actress Croizette. After this, he had as sitters such notable personages as Gustave Doré, Gounod, Pasteur, Emile de Girardin, Henner, Paul Déroulède, Cardinal Matthieu, Queen Maria Pia of Portugal, Mme. de Pourtalès, Countess de Vandal, Princess de Wagram, Countess of Warwick, and Duchess of Marlborough, and in the United States, which he visited a number of times, Mrs. William Astor, Mrs. John Astor, and other society women. He had extraordinary skill in the handling of fabrics and accessories, but has been criticized for failing to penetrate to and reveal the character of his sitters. His success as a portraitist rather overshadowed his other work, but he covered a wide range of religious, historical, decorative, and landscape subjects. One of his most notable works is his mural painting, "Gloria Mariae Medici," on a ceiling in the Louvre. This contrasts sharply with his illustrations of events in the life of Christ. Other titles to be noted are: "A Future Doge," "The Triumph of Bacchus," and "Andromeda." From the atelier which Carolus-Duran opened in 1873 some of his pupils went out to be famous. John S. Sargent stands at the head, with Carroll Beckwith, Alexander and Birge Harrison, and Will H. Low among the other Americans who studied under him. He was a grand officer of the Legion of Honor, member of the Academy of Beaux-Arts, honorary president of the Society of Beaux-Arts, and from 1904 to 1913 director of the French Academy in Rome. He received numerous salon medals, including the medal of honor in 1879, and was decorated with various foreign orders.

Under the name "Charles Durand" he also wrote novels and short stories, and he was known as an expert boxer, fencer, and horseman, and for his many duels.

**CARREÑO, TERESA.** A celebrated pianist, died in New York City June 12, 1917. She was of Venezuelan nationality, born at Caracas in 1853. Gen. Bolívar was her uncle. Her father, Manuel Antonio Carreño, sometime Minister of Finance, was a talented amateur musician, and from him the daughter received her first instruction as a small child. She was only nine years old when she made her first appearance in New York at a benefit concert in the Academy of Music. She studied in New York with Louis Gottschalk and later in Paris with Georges Mathias. She was also a pupil of Rubinstein. In early life, she began a career in opera, singing in *Les Huguenots* under Mapleson's management and in 1875 in Maurice Strakosch's company with Brignoli and Tagliapietra. Her versatility did not end here, for she even conducted an opera troupe herself once in Venezuela, and she composed a string quartet, works for piano, and the Venezuelan national anthem. But her great reputation was made as a pianist. On two continents she was hailed as the greatest of woman artists at her instrument. She continued to tour in concert and to play with famous orchestras in the great cities until a few months before her death. She was especially famous for the great physical power at her command, which invested her playing with a brilliancy and force seldom attained by women pianists. She had often been called the "Valkyr of the piano." Mme. Carreño was four times married and thrice divorced. Her first husband was Emile Sauret, violinist, her second, Giovanni Tagliapietra, a singer, her third Eugen d'Albert, pianist and composer, and her fourth Arturo Tagliapietra, younger brother of Giovanni. Her most famous pupil was the American composer Edward MacDowell. Mme. Carreño, although she considered herself an American, had resided principally abroad, where she left five children. After the war her ashes were to be sent to Berlin for burial.

**CARSE.** See RAILWAYS.

**CARSE, MATILDA BRADLEY.** An American temperance leader, died at Park Hill-on-Hudson June 3, 1917. She was born in 1835 at Saintfield, near Belfast, Ireland, in 1835, but after 1858 lived mostly in Chicago. Thomas Carse, her husband, died in 1870. With Frances E. Willard and Lady Henry Somerset, Mrs. Carse helped to found the Woman's Christian Temperance Union and she was the founder and president of the Woman's Temperance Publishing Company. Of the Chicago Central Woman's Christian Temperance Union she was president for nearly forty years. She was long prominent in Chicago civic life and charities, and especially on behalf of women. Through her efforts the first police matron in the city was provided for. Mrs. Carse was the first woman member of the Board of Education, was a lady manager of the World's Fair in 1893, and gave much attention to the suffrage cause. The Woman's Temple of Chicago was founded by her, and the Woman's Club numbered her among its charter members. For four years before her death she lived near New York.

**CARSON, SIR EDWARD.** See GREAT BRITAIN, *History*.

**CARY, EDWARD.** An American editorial writer, died in Brooklyn, N. Y., May 23, 1917. He was born in 1840 in Albany, N. Y., and graduated from Union College in 1863. From that year till 1870 he was editor of the Brooklyn *Union*, and from 1871 till his death, nearly 46 years later, an editorial writer on the New York *Times*. To this newspaper he contributed many of the articles that helped to make it famous, from the earliest attacks on the Tweed Ring to his most recent comment on public affairs. He was an ardent and early champion of civil service reform, being an associate of Carl Schurz, George William Curtis, and Henry Ward Beecher in this movement. He was a leading advocate of independence in political thinking, and was especially effective when working to advance some civic or humanitarian cause or to expose and condemn corruption or fallacy. The downfall of the free silver movement must be attributed in no small measure to his persistent attacks upon it. His writing was quite largely on either political or financial subjects. Mr. Cary contributed to the "American Men of Letters Series" a *Life of George William Curtis*. This was his only book, but the *Times* estimated that he had written for it at least an average of 6000 words weekly throughout his long connection with the paper, so that his collected articles would fill many volumes. Consult the New York *Times*, May 24, 1917.

#### **CASE SCHOOL OF APPLIED SCIENCE.**

A non-sectarian institution of learning at Cleveland, O. In the fall of 1917 there were 456 students and 55 members of the faculty, including those absent in war service. Volumes in the library numbered 13,505. Productive funds in 1917 amounted to \$2,485,144 and the income therefrom and from fees, from September 1, 1916, to August 31, 1917, amounted to \$200,633. Case School was founded in 1881. President, Charles Sumner Howe, Ph.D.

**CASPARI, CHARLES, JR.** An American pharmacist and author, died October 13, 1917, at Baltimore. He was born at Baltimore May 31, 1850, and was educated at the University of Maryland and the Maryland College of Pharmacy. He was appointed professor of pharmacy in the latter institution in 1879, and was dean of the faculty from 1902 until his death. He was general secretary of the American Pharmaceutical Association in 1894-1911, and was appointed State food and drug commissioner of Maryland in 1910. In 1905 he became pharmaceutical editor of the *National Standard Dispensatory*. He published *A Treatise on Pharmacy* (1895; 5th ed., 1916), a work which came to be known throughout the United States and Europe as "Caspari's Treatise." Caspary was the dean of the pharmaceutical profession in the United States.

**CATHOLIC CHURCH.** See ROMAN CATHOLIC CHURCH.

#### **CATHOLIC UNIVERSITY OF AMERICA.**

The national university in America of the Roman Catholic Church, at Washington, D. C. In the fall of 1917 there were 1655 students and 83 members of the faculty. Volumes in the library numbered 130,000. Productive funds in 1917 amounted to about \$1,850,000 and income to about \$215,000. The University was founded in 1863. President, Rt. Rev. Thomas Joseph Shahan, D.D.

**CATOPRITE.** See MINERALOGY.

**CATSKILL AQUEDUCT.** See **AQUEDUCTS**.

**CATTLE.** See **DAIRYING**; **STOCK RAISING**; **VETERINARY MEDICINE**.

**CATTLE TICK.** See **VETERINARY MEDICINE**.

**CAUCASUS.** A division of Russia, on both sides of the Caucasus Mountains. It extends from the Black Sea to the Caspian Sea and is bounded by Turkey and Persia on the south. The area is stated at 181,173 square miles, about equal to Idaho and Wyoming; population, as estimated for January 1, 1915, 13,229,100. Included in the Caucasus are seven governments, five provinces, and two districts. These are divided into two parts, Ciscaucasia and Transcaucasia. Ciscaucasia is the portion lying north of the Caucasus Mountains (except Dagestan and part of Baku) and includes the government of Stavropol and the provinces of Kuban and Terek. Combined area of Stavropol, Kuban, and Terek, 85,767 square miles; population, 5,719,600. Transcaucasia is the portion south of the Caucasus Mountains (but including Dagestan and the northern part of Baku); it consists of the governments of Baku, the Black Sea, Elizavetpol, Erivan, Kutais, and Tiflis, the provinces of Batum and Kars, and the districts of Sukhum and Zakataly. Area, 95,406 square miles; population, 7,509,500.

Caucasia (that is, the Caucasus), from which is named the Caucasian, or white, race of man, is remarkable for groups of tribes having mostly a strong and handsome physique and speaking divers agglutinative languages. The chief of these peoples are the Circassians, Kartvelians, Chechens, and Lezgians. The Circassians include the Cherkess, or Circassians proper (whose language is not known to be related to any other family), the Abkhassians, and the Kabardians. The Kartvelians include the Georgians (language not related to any other family), the Imeritians, the Mingrelians, the Lazes, and the Svanetians. The Chechens are probably related to the Lezgians, but constitute a distinct linguistic family.

Chief cities of the Caucasus, with estimated populations prior to the great war: Tiflis, 327,800; Baku, 237,000; Salyany, 120,900; Ekaterinodar, 107,400; Vladikavkaz, 79,300; Novorossiysk, 66,700; Stavropol, 64,700; Elizavetpol, 63,400; Kutais, 53,900; Mailkop, 52,600; Eysk (Yeisk), 51,800; Alexandropol, 48,900; Armavir, 47,000; Batum, 46,000; Shusha, 42,700; Nukha, 41,800. See **WAR OF THE NATIONS**.

**C. C. N. Y.** See **NEW YORK, COLLEGE OF THE CITY OF**.

**CELEBRATIONS.** On October 26 the bicentenary of the founding of New Orleans was celebrated both in the United States and France. There were no other celebrations of general or historical character during the year that call for special mention at this place. Elsewhere in this **YEAR BOOK** will be found an account of the exercises that attended the opening in October of the new Catskill Aqueduct from which New York City derived its increased water supply. See **AQUEDUCTS**.

**CEMENT.** The production of Portland cement, which represents the bulk of the mined production in 1917, broke the record. There were produced approximately 93,554,000 barrels, an excess over the preceding record production, that of 1913, of nearly 1,500,000 barrels, and over the production of 1916 of more than 2,000,000, or 2.2 per cent. The shipments

in 1917 amounted to about 90,630,000 barrels. These fell below the shipments of 1916 by nearly 4,000,000 barrels or about 4 per cent.

Throughout the United States during the year, higher prices prevailed than in the previous year, except at a few plants at the Pacific Coast. These higher prices were, however, accompanied by higher cost of manufacture. The demand for cement was very good during the first eight months, but showed a falling off during the remainder of the year as a result of unsatisfactory conditions of labor and traffic.

**CENTRAL AMERICA.** The republics of Guatemala, Honduras, Salvador, Nicaragua, and Costa Rica and the colony of British Honduras. Usage varies with respect to "Central America," some writers including Panama therein and some regarding it as covering the territory between the Isthmus of Panama and the Isthmus of Tehuantepec. See articles on the countries named above.

**CEYLON.** A British island in the Indian Ocean off the southern extremity of Hindustan, lying between 5° 55' and 9° 51' N. lat. and 79° 41' and 80° 54' E. long. Its extreme length from north to south, i.e., from Point Palmyra to Dondra Head, is 266 miles; its greatest width 140½ miles, from Colombo on the west coast to Sangemankande on the east. Its area is 25,332 square miles. The Máldivé Archipelago, 400 miles west of Ceylon, made up of 17 groups of islets, which is sparsely inhabited by a mixed race of probably Aryan original stock, is tributary to Ceylon. The islands are covered with coconut palms and yield millet, fruit, and coconut produce. Communication is mainly by native craft with India and Ceylon. The population is estimated at 72,237; the people are traders and seamen. Plantation laborers number about 510,000 (in large part Indian coolies). Acreage in 1915 under coconuts, 980,000; rice, 785,000; other grains, 131,000; tea, 427,000; rubber, 200,000; cinnamon, 45,000; cacao, 41,500. In 1915 the exports of tea were 215 million lbs., of which 124 million lbs. were sent to the United Kingdom. The exports of desiccated coconuts were 349,009 cwts., copra, 1,208,629 cwts., and coconut oil, 501,510 cwts. In the same year, 48,803,816 lbs. of rubber were exported, of which 26,898,371 lbs. went to the United Kingdom, 19,383,095 lbs. to the United States, and 2,622,350 lbs. to other countries. Exports of rubber, 1916, 54,500,000 lbs.

Imports for 1915 are given at £11,229,735; exports, £18,225,145; revenue (1914-15), £3,436,365; expenditure, £3,571,868. Public debt Sept. 30, 1915, £5,750,862. Railways open at end of 1915, 693 miles. In 1917 the Ceylon Government Railway comprised a system of 706 miles, of which only 22 miles were double track. Over a large portion of this line the traffic was very heavy.

**CHAILLÉ-LONG, CHARLES.** An American soldier, explorer, diplomat, and writer, died at Virginia Beach, Va., March 24, 1917. He was born at Princess Anne, Md., in 1842. Shortly after leaving Washington Academy (Md.), he enlisted in a Maryland volunteer regiment and rose to be captain before the end of the Civil War. By 1869, as lieutenant colonel in the Egyptian army, he had become identified with that country where he long served with distinction. Up to 1873 he was chief successively of

three sections of the general staff of the army, and then for three years was chief of staff to General "Chinese" Gordon, Governor General of the Egyptian Sudan. By the treaty which he negotiated with King M'Tesa, Uganda was annexed to Egypt in 1874, and in this same year passed over a hitherto unexplored part of the Victoria Nile and discovered Lake Ibrahim, thereby clearing up the mystery of the river's source. For this service he received, 36 years later, a gold medal from the American Geographical Society. In 1874, also, he was wounded, and cited in general orders, was decorated with the cross of the Medjidie for expeditions to Niam-Niam and the East Coast of Africa, and was promoted colonel and bey. Three years later he retired. This, however, was not the end of excitement for Chaillé-Long, for in 1882, when Alexandria was bombarded by the British, he stepped in to be acting consul for the United States and gave protection to thousands of refugees of all nationalities. The cross of Osmanie was his reward. For two years (1887-89) he was secretary of legation and consul general of the United States in Korea, and he was prominent in the Postal Congress of 1897 and in the special commission to the Paris Exposition in 1900. After some of his earlier adventures he had returned to the United States to study law at Columbia University, with the class of 1880. In France, where he lived for some years, he was made chevalier of the Legion of Honor, honorary member of the Institut Egyptien, and member of several geographical societies. In later life he made Washington his home. Beside long contributions to learned publications, Col. Chaillé-Long wrote books that are valuable records of exploration and ethnological study: *Central Africa* (1876), translated into French; *The Three Prophets: Chinese Gordon, Mohamed-Ahmed, Arabi Pasha* (1884); *My Life in Four Continents* (1912).

**CHAMBERLAIN, ROBERT N.** An American jurist, died September 20, 1917, at Boston, Mass. He was born in 1860, was appointed associate justice of the Supreme Court of New Hampshire in 1904, and in 1917 became Chief Justice in succession to Chief Justice Robert G. Pike, who died in January of that year.

**CHANDLER, WILLIAM EATON.** An American politician, died November 30, 1917, at Concord, N. H. He was born in Concord, N. H., December 28, 1835, and graduated at the Harvard Law School in 1864, the late Joseph H. Choate being one of his classmates. Entering politics, he served three terms in the House of Representatives in his native State, and was Speaker of that body in 1863-64. In 1865 he was appointed by President Lincoln the first Solicitor and Judge Advocate General of the Navy Department. He was First Assistant Secretary of the Treasury under Secretary McCullough from 1865 to 1867, and Secretary of the Navy under President Arthur in 1882-85. During his term of office the building of the modern American navy was begun. Chandler was United States Senator from New Hampshire in 1887-1901, after which he was appointed president of the Spanish Treaty Claims Commission. He was a member of the New Hampshire Constitutional Convention in 1902. Chandler was one of the most ardent supporters of Lincoln and was one of the founders of the Republican Party.

**CHARITIES.** The year 1917 was unprece-

dented in American history for the extent of charitable and philanthropic activities. While there were no single large endowments comparable to some of those of the recent past the universal support of the activities of the Red Cross (q.v.), Y. M. C. A. (q.v.), the relief of special calamities by national or local appeal, such as in the case of the Halifax disaster in December, and the generous support of local charities gave to the philanthropic activities of the year a breadth and depth of social interest previously unknown. The Rockefeller Foundation (see ROCKEFELLER PHILANTHROPIC BOARDS) carried on its extensive activities throughout the world. Perhaps, however, the most important feature of the year was the manifestation of world charity through the activities of the Y. M. C. A. and the continuance and development of numerous funds serving different classes of those made needy by the European war as described under RELIEF FOR WAR VICTIMS. While the year was one of unusual industrial prosperity with the consequence that unemployment (q.v.) which is a chief cause of dependency and delinquency was reduced to a minimum, nevertheless the sharp advances in the cost of living (see PRICES) more than offset advances in wages and the benefits of continuous employment. The conferences noted below were only a few among many. There were in addition conferences of those interested in special classes, as the blind or tubercular, and State conferences of a comprehensive sort in many States. In addition to the matter below see JUVENILE COURTS; MINIMUM WAGE; OCCUPATIONAL DISEASES; OLD AGE PENSIONS; PENSIONS FOR MOTHERS; PENOLOGY; PROSTITUTION; WOMEN IN INDUSTRY; and WORKMEN'S COMPENSATION.

**NATIONAL CONFERENCE OF CHARITIES AND CORRECTIONS.** This conference held its 44th annual meeting at Pittsburgh, June 6-12, with 4300 persons registered as attending. The tendency toward the coördination of charitable and philanthropic activities is indicated by the fact that in conjunction with this conference were held sessions of the following organizations: National Conference on the Education of Truant, Backward, Dependent, and Delinquent Children, June 4-6; American Association of Officials of Charities and Corrections, June 8; American Committee of Polish Social Workers, June 9-11; National Federation of Settlements, June 3-6; National Association of Jewish Social Workers, June 3-6; International Association of Policewomen, June 6-8; National Children's Home Society, June 4-6; National Probation Association, June 5-6.

This same tendency toward coöperation and unification was indicated by the agitation during the last three years for a change in the name and scope of the National Conference resulting in its reorganization in 1917. While there were a considerable number who favored the old name and many also who favored such names as National Conference on Social Welfare, or National Conference on Public Welfare, or National Conference on Social Service, a much larger number favored National Conference of Social Workers. The latter was finally adopted by acclamation as the new name for the conference. At the same time a Committee on Kindred Groups under the chairmanship of Roger N. Baldwin succeeded in bringing about a complete reorganization of the conference. The

following seven divisions were created to be continuous from year to year: the family, children, health, delinquency and correction, public agencies and institutions, industrial and economic conditions, and the local community. Special divisions may be created for a year at a time. As stated in *The Survey* (June 16) special action with reference to the affiliations of other organizations interested in different aspects of social welfare was taken as follows: "Five will remain completely independent—American Association of Societies for Organizing Charity, National Conference of Jewish Charities, National Conference of Jewish Social Workers, National Conference on the Education of Truant, Backward, Dependent, and Delinquent Children, Secretaries of Social Service Exchanges; nine will retain independent existence but will unite their programmes with the national conference—National Children's Home Society, National League on Urban Conditions among Negroes, National Housing Association, American Social Hygiene Association, National Association for the Study and Prevention of Tuberculosis, National Probation Association, International Association of Policewomen, Hospital Social Service Workers, Polish Social Workers; eight will become integral parts of the national conference—Teachers of Practical Sociology, Industrial Social Service Group, Group of Charities Endorsement, Charities Federation and Central Councils of Social Agencies, Officials of Charities and Corrections, Presidents and Secretaries of State Conferences, Land Taxation Group, Special Committee on Radical Social Movements."

The general subject of the 1917 conference as indicated by the address of the president, Frederick Almy of Buffalo, was "The Abolition of Poverty." In his address the president indicated in an optimistic manner the progress during recent centuries in the reduction of poverty, the improvement of health, the reduction of illiteracy and crime and the spread of welfare among a larger and larger proportion of the population.

In the section on the family and the community a special address was given by Helen R. Y. Reid of Montreal on "The Patriotic Fund of Canada." This section also considered the treatment of soldiers' families. The section on health gave attention to public health in war time and special public health nursing problems created by the war. In the section on Community Problems, Professor Irving Fisher of Yale and Rev. Charles Stelzle discussed national prohibition; and Professor Graham Lusk and Lucy H. Gillette discussed economy in diet and food values. There were numerous other special addresses on the programme as originally arranged and carried out.

The declaration of war, however, resulted in the creation of a special section on Social Problems of the War with Edward T. Devine as chairman. The addresses here proved the overshadowing interest of the conference. The chairman indicated that the social problems due to war are in reality an intensification of every social problem of peace. Thus the injured and blinded increase; mortality, especially infant, is magnified; epidemics break out; venereal disease overruns armies and training camps; sexual immorality spreads; numerous illegitimate children are born; prostitutes increase; under-nourishment and exposure produce insanity, crime,

lawlessness, and physical and mental deterioration; education is neglected; children and women are drawn into industry in greater numbers and for longer hours; standards of living are lowered by excessive prices; and family ties are relaxed. Much attention was given to problems of relief connected with the soldier and his family. The majority opinion favored the government's action in paying ample wages and providing insurance of soldiers and sailors against accident and death. (See section under INSURANCE.) There was unanimous approval of national prohibition during the war and for one year thereafter. There was unanimous opposition to the lowering of the standards of labor legislation. Mrs. Florence Kelley said: "We believe that in war as in peace the heavy work should be done by men and that at night the mothers of little children should be at home." A resolution requested the Council of National Defense to appoint a commission for the conservation of social work. It was pointed out that because of increased taxes and higher costs of living there was great danger of a relaxation of social effort at the very time when special effort was needed. Delegates from Canada testified that during the war social and educational activities supported by public funds had been curtailed while that supported by private gifts had been kept near normal through the most strenuous exertion by social workers. Special attention was given to problems of infant welfare during the war, and to the protection of girls and the care of unmarried mothers. A much discussed paper was that by J. Prentice Murphy of Boston who demanded that unmarried mothers be treated as any other mothers; that they be not judged "immoral" nor herded in institutions. Special features of the programme were addresses by ex-President Taft on the "League to Enforce Peace"; by Morris Hillquit on the "Socialist Positions and Aims"; by Samuel Gompers on "The War and Labor"; by representatives of the American Red Cross and the Military Hospitals Committee of Canada; and by Herbert C. Hoover on "The War and Food."

Another significant feature was a resolution circulated unofficially and signed by 570 members, and afterwards transmitted to President Wilson which acclaimed the democratic purposes of the President's address to the Senate in January and his war message of April as well as the response thereto of liberal opinions in England and the ideals of the Russian revolution, and declared, "We pledge the administration our support in such steps as will elicit a fresh statement of peace terms by the allies, repudiating autocracy, disclaiming conquests and punitive indemnities and focusing the liberal forces of all mankind for a democratic organization of the world."

An official resolution of the conference created a special committee on social problems of the war; declared that while many members opposed all war, the majority supported the government in a war for liberty and democracy; and urged "the importance of maintaining the full force and efficiency of the agencies for social work from the destructive and demoralizing influences of war."

Mr. Robert A. Woods of Boston was chosen president of the 1918 conference which will meet at Kansas City. The following divisions for

that conference were authorized and the chairman indicated appointed: Children, Henry W. Thurston, New York; Delinquents and Corrections, Jessie A. Hodder, Framingham, Mass.; Health, Dr. J. H. Landis, Cincinnati; Public Agencies and Institutions, Albert Sidney Johnstone, Columbia, S. C.; The Family, Gertrude Vaile, Denver; Industrial and Economic Problems, Florence Kelley, New York; The Local Community, Charles C. Cooper, Pittsburgh; Mental Hygiene, Dr. William Healy, Boston; Organization of Social Forces, Allen T. Burns, Cleveland; Social Problems of the War and Reconstruction, V. Everit Macy, New York.

The National Conference maintains headquarters at 315 Plymouth Court, Chicago. It issues a quarterly *Bulletin* and publishes the papers and discussions of the annual meeting in its *Proceedings*.

**THE NATIONAL FEDERATION OF SETTLEMENT.** This organization met at Pittsburgh June 3-6, in conjunction with the National Association of Music School Societies. Representatives were present from 94 organizations in 33 towns and cities in 17 States and Canadian provinces. A preliminary report was made of an investigation carried on jointly by 35 settlements comprising 350 workers. The inquiry covered 9900 girls of 13 nationalities. Returns to a questionnaire had been received from school teachers, nurses, mothers, court officials, charity workers, and settlement residents. A similar inquiry for the pre-adolescent boy was called for. There was discussion of the experiments of the New York Police Welfare Bureau in utilizing boys with wayward tendencies as junior police; and of the relations of moving pictures to the development of city youth. It was known that various settlement workers were strongly pacifist in their points of view and yet after extensive discussion resolutions were drawn pledging support to the government in the war. The resolution affirmed, however, "that to the greatest possible extent the rights of free assembly, free speech, a free press, and the freedom of conscience must be preserved." Graham Taylor was elected president for 1918.

**THE NATIONAL SOCIAL WORKERS' EXCHANGE.** An office was opened by the new organization in August at 130 East 22d Street, New York City. The organizing committee was composed of Richard H. Edwards, Margaret F. Byington, James H. Cushman, and some dozen others chiefly from the former committee supervising the Social Work Department of the Intercollegiate Bureau of Occupations. The former manager of this Department was made the head of the new Exchange, and records were transferred. It was planned to have on file at the Exchange a complete registration of persons interested in and qualified for social work.

**THE AMERICAN ASSOCIATION OF SOCIETIES FOR ORGANIZING CHARITY.** The annual meeting took place in Pittsburgh in June. The chief topics were problems of family stability and rehabilitation as related to the war. Much attention was given in sections for general secretaries and for district visitors to problems of civilian relief. While it was generally agreed that such work should be under the special supervision of some such body as the Civilian Relief Committees of the Red Cross, yet the expert knowledge of the officers of associated charity organizations should be utilized. It was resolved to send a letter to

each of the 166 member societies outlining relations of charity organization societies to Red Cross chapters in matters of civilian relief. Another resolution favored effort to prevent the relaxation of the restrictions imposed by labor laws. Still another favored national prohibition of the importation, manufacture or sale of intoxicants "at least for the period of the war." An additional field worker was authorized to strengthen the activities of the member societies in face of the unusual demands of war time.

**THE NATIONAL CHILDREN'S HOME SOCIETY** met at Pittsburgh, June 4-6. Representatives were present from twenty-six of the thirty-two constituent societies. Topics discussed included, "Juvenile Courts and Child Caring Agencies," "The Development of Rural Nursing," "The Relation of Child Caring Agencies to the Natural Family," and "Ways and Means of Preventing the Separation of Child and Family." It was decided to change the name to National Children's Home and Welfare Association so as to indicate the broadening scope of interest and activities. The next meeting will be at Kansas City with Mr. D. F. Shirk of Kansas as president.

**THE NATIONAL ASSOCIATION OF JEWISH SOCIAL WORKERS** met at Pittsburgh in June. Among the new lines of work indicated was that of the Field Bureau under Dr. Borris D. Bogen. This Bureau was charged with visiting different communities for the purpose of carrying on coöperative efforts and an educational campaign for higher standards. It also began the registration of Jewish transients in order to ascertain the extent of migration within the United States. In addition it formed the National Jewish Tuberculosis Commission. The conference appointed a committee to register social workers and to develop approved standards for Jewish charity and philanthropy. Other subjects discussed were Americanization and the Morals' Court.

**THE NEW YORK FEDERATION OF JEWISH PHILANTHROPIC SOCIETIES** carried on an eight weeks' campaign in December, 1916, resulting in pledges of over \$2,000,000 for 1917. About eighty organizations were united in this effort; and the total sum realized was the largest ever pledged for a similar purpose in this country. Over 9000 persons made pledges, with the result that the guaranteed incomes of the federated societies were doubled.

**CATHOLIC CHARITIES.** A distinguishing feature of the development of Catholic charities in recent years is the tendency toward coordination along with an increasing effort to meet the special and newer problems of modern industrialism. Thus the National Federation of Catholic Societies recently formed has served to unify the aims and methods of related activities. Recent sessions of the national conference of Catholic charities have given special attention to problems of industry centring about the minimum wage and social insurance for wage earners. A tendency to make the parish a social as well as religious centre is manifested in efforts to increase the social uses of the parish house. Special attention has been directed also to problems of juvenile delinquency, mothers' pensions, and protection of girls. In January, 1917, appeared the first issue of *The Catholic Charities Monthly*. It is issued from the Catholic University at Washington with Prof. John A.

Ryan as editor. To give it a clear field the *St. Vincent de Paul Quarterly* suspended publication. The *Catholic Social Year Book for 1917* showed that British Catholic charities in war time are dealing with relief among civilians, schools for mothers, thrift, temperance, defective children, agricultural organization, educational improvement, and citizenship.

**CHAUTAUQUA INSTITUTION.** The leading fact concerning the work of the Institution in 1917 was its very definite functioning with respect to the public mind and the war. In the Chautauqua Summer Schools all the courses of instruction regularly prescribed by the Red Cross were instituted and given special promotion, with gratifying results. Military training for men and women was given. The Speakers' Training Camp held July 2-7 under joint auspices of the Institution and the National Security League drew to Chautauqua about a thousand men and women of place and influence, many of whom had been officially appointed by the governors of their respective States, and more than a dozen of whom have since launched campaigns of popular education in patriotism. The National Security League in a recent bulletin declares that in one way or another, organizations and State propaganda in twenty-four States have resulted. "Wake up America" was the slogan of this gathering. The President of the Institution is Arthur E. Bestor, who was appointed by President Wilson head of the Speakers' Bureau of the Committee on Public Information, with headquarters in Washington. Several periodicals are published at the headquarters, Chautauqua, N. Y., and a New York City office is maintained at 119 West 40th Street.

**CHAUVEAU, JEAN BAPTISTE AUGUSTE.** A French veterinary, physician, and physiologist, died in Paris January 5, 1917. He was born in 1827 at Ville-neuve-la-Guyard (Yonne). After leaving the Veterinary School at Alfort in 1848, he became chef-de-service at the Lyons Veterinary School, where he was professor of anatomy and physiology by 1863 and director by 1875. Subsequently till his death he served as professor and honorary professor of pathology at the Museum of Natural History, Paris, and as inspector general of the veterinary service. Chauveau was elected to the Institute (Academy of Sciences) in 1886 and held the presidency of the Academy of Medicine in 1913. He was a grand officer of the Legion of Honor. Some of his most important researches were made on infectious diseases. He held that tuberculosis of men and animals was essentially the same and that one treatment should be employed for men and animals in corresponding diseases. With Marey he made notable studies of the physiology of the heart, and devised a method of registering circulation and other physiologic movements. He also investigated, in general physiology, the functions of the liver, and studied muscular physiology. Turning to food values, he opposed the theory that foods could be interchanged so long as the total amount of calories was kept the same, and he refused to recognize food value in any kind of alcoholic drink. Besides many contributions to professional journals and the proceedings of societies, Chauveau published *Traité d'anatomie comparée des animaux domestiques* (1856-57), and with Gariel and d'Arsonval *Traité de physique biologique*. He founded and became director of the *Revue de Tuberculose*

and was director also of the *Journal de physiologie et de pathologie générales*.

**CHEESE.** See DAIRYING.

**CHEMICAL ENGINEERS,** AMERICAN INSTITUTE OF. See CHEMISTRY, INDUSTRIAL.

**CHEMICAL INDUSTRIES.** See CHEMISTRY, INDUSTRIAL.

**CHEMICAL INDUSTRY, SOCIETY OF.** See CHEMISTRY, INDUSTRIAL.

**CHEMICAL SOCIETY, AMERICAN.** See CHEMISTRY, INDUSTRIAL.

**CHEMISTRY, GENERAL PROGRESS OF.** The great world struggle naturally stimulated research in 1917 along lines of work that would give promise of ultimate application in the industrial world. The experience of past decades had emphasized the utility of even the most apparently useless kind of experimentation. While the amount of such research in war times obviously was restricted by the call of the workers to immediate and pressing duties, still a goodly amount of general work in chemistry was presented.

**PHYSICAL CHEMISTRY.** The accurate determination of atomic weights is research, but so important are the tables of atomic weights that are annually presented that an untold valuation is justly attributed to them by the industrial chemical world. In the Twenty-fourth Annual Report of the Committee on Atomic Weights, the determinations published during 1916 were discussed. The only atomic weights to be radically changed were the following: yttrium, 88.91; columbium, 93.13; neodymium, 144.26; and dysprosium, 164.23. Radio-active lead from selected radio-active minerals showed a range of values from 206.079 to 207.015. The isotopes thorium and thorium-ium were found to have atomic weights of 232.15 and 231.50, respectively. The International Committee on Atomic Weights decided to make no full report for 1918. The table for 1917 will therefore be official for 1918.

Irving Langmuir continued his studies on the fundamental properties of solids and liquids; in 1917 contributing a valuable discussion of the character and nature of the chemical forces. Such forces as are manifested in evaporation, condensation, solution, crystallization, adsorption, surface tension, and the like are commonly ascribed to physical action. The author considered these as being the so-called chemical forces since gravitation is much too small to be of influence in holding atoms and molecules together and in ordinary matter, the positive and the negative electricities are so uniformly distributed that their effective ranges are only of atomic dimensions. The chemical forces that exert an influence in matter are the primary and secondary valences. The differences between solids and liquids are much smaller than those between liquids and gases. For example, the optical and electrical properties of liquid and solid mercury are only slightly different, while such differences between liquid and gaseous mercury are marked. The differences between solids and liquids appear to lie in the mobility of the latter and in such properties as are dependent on mobility, which is due to a shifting of the relative positions of atoms which are chemically combined to each other. This mobility then, was a manifestation of tautomerism which, Lewis had pointed out, was a common characteristic of inorganic liquids. The only solid body which

seems to be held together by primary valence is the diamond and probably other forms of carbon as these never occur in the liquid state.

Researches on the structures of inorganic compounds had led to three types of combinations which explained more satisfactorily the phenomena of polymerization and the union of crystal water within a molecule. The three types were (1) combinations due to the saturation of primary affinity only, or the strong electrolytes; (2) combinations due to the saturation of secondary affinity only, or the molecular compound type; (3) combinations due to the saturation of both primary and secondary affinity which may be called the organic compound. Most compounds take up intermediate positions between these extremes.

W. D. Harkins, F. E. Brown, and E. C. H. Davies studied the attraction of liquid surfaces to each other as oil films on water. This is a measure of the solubility of one liquid in another. Such molecules are oriented so that the active group, for example, a carboxyl group, at the end of a hydrocarbon chain is in contact with the water. Double bonds and certain other groups, such as sulphonyl, carbonyl, and hydroxyl likewise exert a polarizing influence and are called the active or polar groups. This attraction of water for these soluble groups is sufficient to make the molecules of the liquid soluble if the attraction is strong enough to draw in the entire molecule, provided the residue is not too long or too large. The authors defined true solubility as "a *molecular scale phenomenon* and is dependent upon the attractions of the different parts of the various molecules for each other, and upon the shapes and sizes of the molecules which must be fitted together to make a solution." The more polar groups that are contained in a molecule, the greater the attenuation of its film on water (due of course to secondary valence). An oil without active groups as pure paraffine oil should not spread at all.

W. D. Harkins presented a publication on the evolution of the atoms and the stability of complex atoms in which he proceeded with the hypothesis set forth by him in 1915, that the chemical elements are very probably intra-atomic compounds of hydrogen (*Jour. Am. Chem. Soc.*, Vol. XXXVII, (1915) pp. 1367-1421). In discussing the hydrogen-helium structure of complex atoms he presented a new periodic system of the element which is the first that is independent of Mendelejev's system. The elements are classified in two series, the even- and the odd-numbered which are headed respectively by helium and lithium. The odd-numbered elements are more abundant in terrestrial matter than the even-numbered, which predominate in both stone and iron meteorites. All elements are combinations of hydrogen and helium. For example, lithium is  $\text{He} + \text{H}$ , theoretical at. wt. 7, determined at wt. 6.94; oxygen is  $4\text{He}$ , theoretical at. wt. 16, determined at. wt. 16.

T. W. Richards and N. F. Hall report further work on the separation of the isotopic forms of lead by fractional crystallization. The results of the observations indicated that not less than 100,000 crystallizations would be necessary to separate the nitrates of radium-D and lead on the one hand and radium-B and lead on the other, if it could be done at all.

A study of the force of chemical valences in

the case of certain isomeric nitro-ammonia cobalt compounds was made by determining the densities of three isomerides. The basis of this investigation was the work of Richards in which he had shown that elements are compressible substances and that chemical affinity instead of merely holding elements together, exerts pressure in their inter-action. This force is directly connected with molecular volume. In the first of the isomerides chosen there was no electrovalency, in the second there was one electrovalency and in the third there were three. If chemical affinity exerts an attraction, the densities of these bodies should increase with the number of electrovalencies and this proved to be the case. It was also shown that the solubilities diminished as the number of electrovalencies increased.

**INORGANIC CHEMISTRY.** A review of the possibility of developing a silicon chemistry was published. There were in 1917 about 500 compounds of silicon known, exclusive of silicic acid and the silicates. A fundamental difference between the analogous carbon and silicon compounds is the striking affinity of the latter for oxygen, in consequence of which most of the silicon compounds are broken down by water. Furthermore the four valencies of carbon are symmetrically distributed in the atom which is not true of the silicon atom.

Experiments showing the action of sulphur dioxide on the oxides of tin, iron, manganese, lead, copper, bismuth, and mercury, were worked out. Tin dioxide remained unaffected at red heat but the monoxide (stannous oxide) reacted with incandescence, producing much sulphur and a nearly quantitative yield of stannic oxide. Ferrous oxide reacted with bright red heat, sulphur and sulphur trioxide were evolved and the residue gave tests for ferrous, ferric, and sulphate ions. Similar results were obtained with manganous oxide—the residue after prolonged heating was pure manganous sulphate. With lead oxide (litharge) the reaction is accompanied by a dull red glow. No sulphur or sulphur trioxide is evolved and the remaining black powder is a mixture of sulphide and sulphate of lead. Black copper oxide reacted with sulphur dioxide to form cuprous oxide and copper sulphate. The reaction with bismuth oxide was of special interest in that it indicated the formation of a lower oxide of bismuth ( $\text{BiO}$ ). No sulphide or free sulphur could be found and only traces of sulphur dioxide. Mercuric oxide yielded the two sulphates of mercury, metallic mercury and sulphur trioxide.

Continued study of the atmospheric corrosion of commercial sheet steel has shown that the character of the rust varies greatly with the composition of the steel. Bessemer and open hearth steels form a loose yellow rust; the other varieties form a dark red, adherent scale. Steels and irons made with copper have the most adherent rust, the period of resistance under the experimental conditions running over 1200 days; in fact they had not failed at the time of making the report. The amounts of copper in such specimens range from 0.181 per cent to 0.268 per cent. The period for mild steels was about 355 days. Charcoal iron and commercial pure iron resist better than mild steel.

**ANALYTICAL CHEMISTRY.** Reference to the use of "Nitron" as a gravimetric reagent in the analysis of materials used in the manufacture

of explosives is appropriate. "Nitron" is a convenient name for 1, 4-diphenyl-3, 5-endoanilodihydrotriazol. The body is basic and forms salts, a great number of which are insoluble in water. It is this property of the nitrate that has led to its successful application as a gravimetric reagent for nitric acid and the nitrates. The "Nitron" nitrate is precipitated from a hot solution containing not over 0.15 gms. of nitrate. This reagent is also applicable in the analyses of nitro compounds, perchloric acid and the esters of nitric acid.

Blood may be detected in urine by adding to 3-4 cu. cm. an equal volume of a 5 per cent alcoholic solution of pyramidone and 6-8 drops of acetic acid. Shake and add 5-6 drops of hydrogen peroxide (12 vols.); an intense violet or bluish violet color develops. This method is applicable to any pathological fluid or to an extract of fecal matter.

Detection of picric acid and its derivatives is easily effected by use of ferrous sulphate—tartaric acid solution. When applied as a ring test the presence of picric acid is indicated by a red coloration.

**ORGANIC CHEMISTRY.** An investigation of pectins from sugar beets resulted in the isolation of a new substance which stands in the same relation to dextro-galactose as does dextro-glycuronic acid to dextro-glucose. It is named dextro-galacturonic acid. The residual cell material after the removal of the sugar was used to prepare raw pectin. This material is a mixture of two easily separable substances. One of these, present only to a small extent, is a laevorotatory arabin (gum arabic), the other is a calcium magnesium salt of pectic acid. A detailed study of this pectic acid was made and considerable information obtained. This study was of scientific importance and also important because of the possible uses of pectin substances as foods.

Continued studies in halogenation by R. L. Datta and N. Prosad in India were made with the use of nitrogen iodide in conjunction with aqueous ammonia. This reagent was applied not only to phenolic bodies for the preparation of iodine substitution compounds, but was found to be satisfactory as an oxidizing agent in a limited number of cases. It further reacts with a large number of organic compounds (chiefly ketones and amines) to produce iodoform. In most cases, the iodoform only separates from dilute solutions. Iodine in the presence of ammonia does not affect ethyl and propyl alcohols. It does not appear that the presence of the group,  $-CH_2CO-$  is necessary for the formation of iodoform. Iodine in the presence of ammonia is also useful as a general iodinating reagent and in the case of pyrrol, the reaction is quantitative and a volumetric method for estimating this body is proposed.

A new hydrocarbon, *spinacene*, has been found in certain fish liver oils. The oils were obtained from two species of fish, *Centrophorus granulosus* and *Scymnus lichia*, respectively, of the shark family or spinacidae, which are caught in deep water off the Moroccan coast. The liver oils contained nearly 90 per cent of an unsaturated hydrocarbon and had a saponification value of 22.5 mg. of potassium hydroxide per gramme of oil. The new hydrocarbon has the formula  $C_{20}H_{32}$  and yields well characterized derivatives.

The chemistry of caramel was one of the subjects that had been undertaken with a view to throwing some light on the constitution of cellulose and the production of humus, peat, and coal. The particular derivative studied was caramelan, which was produced by heating sucrose until the loss of weight amounted to 12 per cent. Caramelan behaves like a ketose and condenses with phenylhydrazine and semicarbazide.

**BIOLOGICAL CHEMISTRY.** An Italian chemist criticized the use of superphosphates in agriculture. He found that the whole of the phosphorus contained in plants occurred in the form of phosphoric acid combined with mineral bases. Plants do not contain or absorb mono- or dicalcium phosphates (superphosphates). Superphosphates exert a retarding action on the germinative power of seeds. Where universal fertilization is to be effected it is best to apply those mineral substances that the plants themselves contain.

A paper by D. D. Van Slyke and associates on the concentration of hydrogen carbonate in blood plasma showed how the determination is a measure of acidosis. The work was based on the hypothesis that free carbon dioxide is present in the fluids of the body in such concentration that it automatically converts into hydrogen carbonates all bases not combined with other acids. It therefore constitutes an "alkaline reserve" of the body. The carbon dioxide contained in blood plasma was determined by the authors by shaking the plasma from oxalated blood in a separatory funnel with air containing 5.5 per cent of carbon dioxide. This latter gas is estimated by shaking the solution in a vacuum and the volume of the liberated gas is measured over mercury. The average amount of carbon dioxide in terms of hydrogen carbonate in the plasma of normal men is 65 cu. cm. per 100 cu. cm. of plasma under standard conditions. In acidosis this value falls below normal and is less, the greater the severity of the acidosis condition. This method is delicate and can be applied clinically.

A series of articles on acidosis described respectively the following: (1) An electrometric titration of plasma as a measure of its "alkaline reserve." (2) The relationship between "alkaline reserve" and acid excretion in which it is shown that introduction of acid into the circulation increases the rate of excretion of acid salts and acids, also that this relationship is quantitative. (3) The ratio between the tensions (in mg. of mercury) of alveolar carbon dioxide and plasma hydrogen carbonate in a normal man varies from 1.27 to 1.80; the former rises after a meal, while the latter is only slightly increased. (4) The conditions of a number of diabetic patients have been observed with respect to alveolar carbon dioxide tension, hydrogen carbonate in the blood and in blood plasma, hydrogen ion concentration in the blood and the index of acid excretion in the urine from day to day. A noticeable parallelism could be seen in all the curves that expressed the results.

**CHEMISTRY, INDUSTRIAL.** The achievements during the year in this special branch of science tended to confirm previous anticipations. The plants but recently established in the United States had developed along satisfactory lines and capital had been freely extended to struggling enterprises. Not only was the United

States manufacturing many products previously imported, but the tide was beginning to turn and American export business in chemical products was on the increase. In his presidential address before the American Chemical Society, Julius Stieglitz concluded his remarks on the outlook for chemistry in America by emphasizing "that we have a goodly heritage of success both in our great industries and in our great universities, which will form the safe basis of a brilliant future, if we will but approach the problems of the moment and of the immediate future in characteristically American fashion, with a spirit wisely combining altruistic principles with practical worldly common sense."

In Europe conditions were similar and Great Britain with splendid energy was striving to regain the heritage of supremacy in chemical industries which had passed to Germany.

**ORGANIZATIONS.** The American Chemical Society held its spring meeting in Kansas City, Mo., during April 10-14. Four new local sections to be known as Southeastern Texas, Central Texas, Toledo, and Michigan Agricultural College sections were authorized. The annual meeting was held in the Massachusetts Institute of Technology in Boston, Mass., during September 10-13. The membership of this important society in 1917 exceeded 10,500. The president during the year was Julius Stieglitz. The American Electrochemical Society held its spring meeting in Detroit, Mich., during May 2-5, and its autumnal meeting in Pittsburgh, Pa., during October 3-6. C. G. Fink was president during the year. The ninth annual meeting of the American Institute of Chemical Engineers was held in New York City during January 10-13, and the semi-annual meeting was held in Buffalo, N. Y., during June 20-22. The president during the year was George W. Thompson.

The Society of Chemical Industry held its 36th meeting in the building of the University of Birmingham, England, during July 18-20, 1917, under the presidency of Charles Carpenter. The membership was reported as 4429, as compared with 4059 in 1916. An increase of dues was recommended and the desirability of a suitable hall in London was discussed. Prof. Henry Louis, who holds the chair of mining in Durham College of Science, was chosen president for the ensuing year. The first annual report on the Progress of Applied Chemistry prepared by this Society was issued during the year. There was organized in 1917 in France a Société de Chimie Industrielle, of which Paul Kestner became president. An American section has been proposed.

**NATIONAL EXPOSITION OF CHEMICAL INDUSTRIES.** During the week of September 24-29 there was held in the New Grand Central Palace in New York City the third National Exposition of Chemical Industries. There were about 350 exhibitors and it was described as "the largest and most complete exhibition of these industries ever held anywhere." The purpose was not so much to show the progress made in all the chemical industries but rather to indicate where progress could be made and where opportunities awaited development, and how our national resources and wastes might be made more valuable and useful. Typical of this feature among the exhibits was one showing how the United States was saved from "war shortages" of dyes, acids, pulps, and other prod-

ucts by raw materials from the big timber sections of the Southern States.

The exposition was opened with a series of addresses by C. H. Herty, chairman of the Exposition Advisory Committee, Julius Stieglitz, president of the American Chemical Society, C. G. Fink, president of the American Electrochemical Society, and G. W. Thompson, president of the American Institute of Chemical Engineers. Lectures and addresses during the week were delivered as follows: "Glass Manufacture," by Alexander Silverman of the University of Pittsburgh; "The Operation and Work of the National Research Council for the National Weal," by M. T. Bogert, chairman of the Chemical Committee of the National Research Council; "The Tariff Commission and Its Operation," by F. W. Taussig, chairman of the U. S. Tariff Commission; "The Tariff Commission and Its Operation with Reference to the Chemical Schedule," by Grinnell Jones, technical expert to the commission; "The Development of Export Trade with South America," by W. S. Kies of the National City Bank; "The Future of the American Chemical Industry," by L. H. Baekeland of the Naval Consulting Board; and a "Symposium on National Resources for Chemical and Allied Industries," participated in by the following experts, C. H. Crawford, V. V. Kelsey, T. P. Maynard, E. A. Schubert, and J. H. Watkins. Also there were special meetings of the American Institute of Chemical Engineers and the New York Section of the American Chemical Society held in connection with the exposition.

Motion pictures illustrating such important subjects as "Hydraulic Power Development," "Manufacture of Leather and Its Products," "The Manufacture of Glass," "Production of Spelter and Manufacturing of Lead Products," "The Pulp and Paper Industry," "Coal, Coke and By-Products Industry," "The Petroleum Industry," "The Metal Industries," "The Manufacture of Portland Cement," "The Milk Industry," and others were shown. It is estimated that 25,000 chemists and others interested in kindred professions visited the exposition. At its close the New York Times described it as showing a "marked optimism as to the future and an absence of the apprehension regarding foreign competition after this war."

**RELATIONS OF CHEMISTRY TO THE UNITED STATES GOVERNMENT** "Never in the history of the world has the rôle of chemistry in warfare approached anything like its present importance, and the opportunities and responsibilities of the chemist have increased concurrently." The national government has been quick to take advantage of the knowledge of her men of science and the following commissions composed of specialists have been called into active participation in the Great War against the Central Powers of Europe. Under this heading in the YEAR Book for 1916 (p. 132) the organization of the Naval Consulting Board was mentioned. Its chemical delegates appointed by the American Chemical Society are L. H. Baekeland and W. R. Whitney.

It was also during 1916 that the National Research Council was established by the National Academy of Sciences at the request of President Wilson. The Chemistry Committee was organized in 1917 with Marston T. Bogert as chairman, who established his office in Washington. This committee worked through sub-committees

on Analytical Chemistry; Chemical Apparatus; Biochemistry; Carbohydrate Chemistry; Chemistry of Cellulose and Paper; Chemistry of Cements and Related Building Materials; Chemistry of Ceramics; Chemistry of Dyestuffs and Textiles; Electrochemistry; Chemistry of Explosives; Chemistry of Fats, Fatty Oils, and Soaps; Chemistry of Fermentation and Fermentation Products; Food Chemistry; Chemistry of Forest Products; Chemistry of Fuels; Gases Used in Warfare; Chemistry of Glass; Chemistry of Glue and Other Colloids; Inorganic Chemistry; Chemistry of Leather and Tanning; Metallurgical Chemistry; Mineralogical and Geological Chemistry; Nitrates and Ammonia; Organic Chemistry; Paints, Varnishes, and Resins; Pharmaceutical Chemistry; Physical Chemistry; Chemistry of Rubber and Allied Substances; Chemistry of Soils and Fertilizers; Chemistry of Synthetic Drugs; Platinum and Related Metals; and Potash. Already more than 300 confidential reports have been prepared by this committee, which also acts as the Department of Science and Research of the Council of National Defense.

The Council of National Defense, which consists of the Secretaries of War, Navy, Interior, Agriculture, Commerce, and Labor, has an Advisory Commission of seven members, including Bernard M. Baruch, who was in charge of raw materials, minerals, and metals, and associated under and cooperating with him were committees on alcohol; aluminum; asbestos, magnesia, and roofing; brass; cement; chemicals (with sub-committees on acids, alkalis, electro-chemicals, fertilizers; miscellaneous chemicals; coal-tar by-products, pyrites, and sulphur); copper; lead; lumber; mica; nickel; steel and steel products (with sub-committees on alloys; sheet steel; pig tin; steel distribution; scrap iron; pig iron, iron ore, and lake transportation; tubular products; tin plate; wire rope; wire products; cold rolled and cold drawn steel of the steel and steel products committee); oil; rubber; wool; and zinc.

A chemical division was also organized in connection with the Food Administration. It will devote itself to the control and allocation of chemicals used in the production and conservation of foods. Charles W. Merrill has been placed in charge of this division.

At the request of the Council of National Defense, the Bureau of Mines in cooperation with the American Chemical Society made a census of over 10,000 chemists of the United States for such use as might be necessary.

In February President Stieglitz on behalf of the American Chemical Society placed at the command of the President its "8000 members" with special reference to "matters facilitating preparations of munitions, supplies, medicinal remedies, and other chemical materials."

An American Industrial Commission was organized and sent to France by the American Manufacturers' Export Association of New York City in 1916. Chemistry was represented on the commission by F. J. Le Maistre who prepared *A Survey of the Chemical and Allied Industries in France During the War* which was published in March. According to this report French manufacturers were convinced that they were operating on altogether too small a scale, consistent with the cost of production, and that, if after the war, they were to place themselves

in a position to compete with German manufacturers it would be essential to drop certain lines of manufacture and encourage the combination of the others as far as possible. The separate industries are briefly discussed in the report.

**MEDALS.** On January 19 the eleventh presentation of the Perkin medal was made to Ernest Twitchell for his services in the field of fats and their saponification. The Willard Gibbs medal of the Chicago section of the American Chemical Society was on May 18 presented to Edward W. Morley for his distinguished contributions to chemistry and especially his studies on oxygen and hydrogen. No award of the W. H. Nichols medal for distinguished research work was made during the year. The second award of the Chandler medal was made to W. F. Hillebrand, who delivered at Columbia University the address on "Our Analytical Chemistry and Its Future."

**METALS. Aluminum.** In March the War Metal Company of Germany began the collection of aluminum. This worked special hardship on housewives who had replaced the copper vessels used in the household economy by the more expensive aluminum utensils. The U. S. Bureau of Standards had succeeded in making spinel (magnesium aluminate) refractories and while these had been made in Germany their successful production in the United States would constitute a new industry. *Antimony.* A new deposit of antimony ore was reported from South Africa and smelting operations were to be begun. *Molybdenum.* A large deposit of this ore was reported from Bathurst, New South Wales. Likewise from southern Peru came the announcement of the discovery of the "largest deposit" of molybdenum ore in the world. The increasing discoveries of various deposits of this ore and the use of the metal in the alloy steel trade resulted in the publication by the Bureau of Mines of *Molybdenum, its Ores and their Concentration, with a Discussion of Markets, Prices, and Uses.*

*Platinum.* The platinum deposits in Spain referred to in the YEAR BOOK for 1916 (p. 132) were very carefully studied by experts under the Spanish government who report that from an economic point of view the nature of the platinumiferous gravel or sand was excellent, as it had no clay to make washing expensive, and no large rocks to interfere with dredging. The platinum contents of the zone studied increased gradually from 8 centigrams a cubic metre at the lower end to 20 centigrams a cubic metre at the last point worked. The quantity of platinum found was regarded as favorable from an industrial point of view considering the present prices of the metal. The experts of the U. S. Geological Survey had reported the presence of platinum in the black sands of Alaska in the vicinity of the Kahiltua River and private concerns had undertaken to exploit these deposits. The growing demand for platinum in the manufacture of chemical apparatus, dentistry, electric lights, explosives, and jewelry led to a careful study of the amount available and the amount used. It was estimated that 65,000 ounces were used annually in the United States of which one half went to the jewelry trade. It was probable that 5,000,000 ounces of platinum had been produced in the world to date. In 1915 about 44,000 ounces were in use in the contact

process for the manufacture of sulphuric acid in the United States, and it was reasonable to assume that contact plants in the world had at least 500,000 ounces. The quantity of platinum in chemical and physical equipment could be hazarded as 1,000,000 ounces. Electrical devices might have used half that quantity but it seemed probable that the platinum in use in 1917 in that industry was perhaps 250,000 ounces. The jewelry industry had consumed at least 1,000,000 ounces, and the dental industry an equal amount. Minor uses and hoarded platinum would account for the remainder of the probable supply.

Among substitutes for platinum announced during the year was a gold-palladium alloy, called "palau" which was offered for the expensive platinum-iridium alloy used by chemists. A crucible of this ware was tested at the Bureau of Standards. The loss in weight on heating to 1200°C. was intermediate between that suffered by crucibles of platinum containing 0.6 and 2.4 per cent iridium, respectively. The melting point of the alloy is 1370°C., which corresponds to that of an alloy of 80 per cent gold and 20 per cent palladium. In resistance to most of the chemical reagents to the action of which such ware is ordinarily exposed, palau compares favorably with ordinary platinum ware.

Other alloys to which the name "rhotanium" was given had a gold content of 60 to 90 per cent. Rhotanium is not suitable for use with hot concentrated nitric acid nor for electrolytic anodes, but for other chemical purposes it is entirely satisfactory. Losses by volatilization at temperatures below 1300°C. are less than for commercial platinum. Rhotanium is malleable and ductile, and can be welded with the use of a flux or other reagent. The specific gravity ranges from about 16 to 18.5. It can be used within its temperature limitations in electric heating units. Its high resistance and low temperature coefficient are valuable in this connection. It is satisfactory as material for contact terminals in many forms of automatic electric devices and may be used in this capacity on certain types of telephones, switchboards, signal devices, lighting and ignition systems, and in most other cases except where it has been found necessary to use a high percentage of iridium alloyed with platinum. Its behavior when tested on certain magnetos was satisfactory, but other experiments performed on a high-grade aeroplane-engine magneto gave negative results. Certain of the alloys have given good service in dentistry when used for pins and baked into porcelain teeth, and as thin foil and heavy sheet. Rhotanium is said to be superior to pure platinum for use in jewelry. It is harder and stronger and takes a better finish. It does not tarnish, is noncorrodible, has practically the color of platinum, and can be worked as readily as platinum. Jewelry made with it passes the common jewellers' and platinum buyers' tests.

**Tin.** This metal was in growing demand for war purposes. In Germany it had been requisitioned by the government. In England the installation of a plant for detinning had been seriously considered in order to prevent the exportation of the large quantities of old tin that had accumulated in the United Kingdom. **Tungsten** was commanding greater importance in the manufacture of high speed steels and

while formerly this metal came from Germany it is now smelted in England while deposits of tungsten ore in Burma and China are being exploited. Deposits in California are being developed and greater outputs are reported. See YEAR BOOK for 1916 (p. 132).

**Iron and Steel.** The flawless rail announced by Dudley in 1916 (see YEAR BOOK for 1916, p. 132) further was reported on by that expert. In reference to finishing the rail he said, "The shrinkage of the hot metal of the rail is more than the simple process of the gradual reduction of length and volume as the temperature falls, for the transformation of the metal from the higher to the lower temperatures should be practically complete through the recalescence at the critical stage in cooling. This is accompanied by the unique phenomena of a rise in temperature during the recalescence with reexpansion of the metal at its critical range of temperature and both should occur, though sometimes they are only partial in an occasional rail head." He found that flaws in the cooling were sometimes caused by the rails being laid too close together, thus causing curves which must be straightened by dangerous blows. He recommended that instead of being bunched for cooling, the rails be laid six inches apart. He explained that "the rails upon hot beds, when spaced about six inches apart, are free from contact with adjacent rails during recalescence and the successive curvings of the base and head, and cool nearly straight. Thus the rails require only a few light blows in the straightening process to correct the surface and line." In concluding his report he said: "Improvements should be made in the hot bed work also the supports in the straightening process should be widened, which would require less pressure of the gag to straighten the rails of heavy and stiff sections. There should also be regularity in rolling, without delays to an occasional bar, to avoid the rails being rolled so cold that they are liable to be chilled, particularly where the mill is subject to low temperatures in the autumn, winter, and spring."

**Potassium.** The production of potash salts and potash products in the United States for 1916 represented 10,000 tons of potash with a net value of \$3,500,000 which is ten times the value of the output reported in 1915 and the estimated output for 1917 is reported to be even greater than that of 1916. The largest output had been from the alkali lakes of Nebraska but other sources were being rapidly developed. Conspicuous among these were the alunite deposits of Utah and sea weed or kelp from the west coast of the United States. An experimental plant was constructed at Summerland, Santa Barbara County, California, for which Congress appropriated \$175,000. The process followed was to distill the dried kelp in retorts constructed on the principle of the by-product coke oven. This resulted in a charred residue containing all the potash salts, which may be recovered by leaching and evaporation. In the process of distillation the nitrogen in the kelp is driven off and recovered in the form of ammonia; combustible gas is evolved in considerable quantities and is available for use as fuel in the retorts and under the evaporating vats, and charcoal and tarry products are also recovered, which may be used as fuel. Iodine is another of the by-products which may be

recovered. Another source which has been conspicuously before the public is Searles Lake in California. It is estimated that there are in the waters of this lake 20,000,000 tons of potassium salts. While this source is under control of the government as a reservation a bill was passed by Congress in October authorizing the acquisition of land for the purpose of developing these salts on the payment of a royalty to the government of 2 per cent of the gross value of the output.

The installation of a plant for the recovering of potash from kelp was announced from Queen Charlotte's Island in British Columbia. Also of importance was the announcement of great deposits of potash salts resembling those at Stassfurt, Germany, in Abyssinia. These deposits are not far from Fatimari which is 76 miles south of Massowah and less than 400 miles from Aden. For a summary of the entire subject see *Fertilizers; An Interpretation of the Situation in the United States*, by Joseph E. Pogue, issued by the U. S. National Museum.

From the Japan came the information of increased output of potassium salts notably potassium chlorate used in the manufacture of explosives. The increase in production was tenfold and while formerly its export was prohibited, that embargo had been removed, and large quantities were being sent abroad.

The successful production of potash as a by-product from feldspar in the manufacture of Portland cement was announced from Durham, Ontario, where a plant was turning out 12 to 16 tons daily. At the end of the year it was claimed that within five years every cement plant in Canada could be producing potash as a by-product, and as the feldspar deposits in northern Ontario were immense, there was good reason to accept this claim. It was also said that the cost of manufacturing potash in Canada from feldspar was so low at present that it was even less than the freight charges paid on a ton of the imported German product before the war. The result of this discovery would be the complete breaking of the German monopoly.

**NITROGEN.** It was said that the great war would early have been over had not Germany, after the Allies had prevented her from obtaining nitrates from Chili, been able to supply the necessary nitrogen compounds required in the manufacture of explosives by extracting nitrogen from the air. It will be recollected that the United States Congress appropriated \$20,000,000 for the erection of plants for the synthetic production of nitrogen. (See YEAR BOOK for 1916, p. 133.) In March the Secretary of War appointed a Nitrate Supply Committee of expert engineers and chemists with Gen. William Crozier as chairman to report on the subject. Special reports prepared by Charles L. Parsons were submitted, culminating in the following recommendations: (1) That \$3,500,000 be made available to build an initial plant which will produce 60,000 pounds of ammonia a day by the synthetic ammonia process, as offered by the General Chemical Company. (2) That the offer of the General Chemical Company be accepted with some arrangement whereby a maximum royalty per ton of nitrogen, when the product is to be used for commercial purposes, shall be inserted. (3) That the construction of the initial plant be started at once at some point selected by the War Department, reasonably near to sulphur, sulphuric acid, and coal supplies. The plant

should be near good water and the land should be available for the later erection of an ammonia oxidation and nitric acid concentration plant. It should be so located that a powder plant may be later erected. (4) That a sum not to exceed \$200,000 be set aside for active experimentation on the Cyanide process. (5) That experimentation on the Cyanide process be conducted at Saltville, Va., where nitrogen soda and coal are available and where the present plant of the Nitrogen Products Company may be studied and utilized. In October a location in Sheffield, Ala., was chosen as the site of the first ammonia and nitric acid plant to be constructed by the government appropriation recently made available by Congress for the creation of a new source of supply of nitrates for use in making powder for the government.

It should also be borne in mind that sources for sodium nitrate were constantly being sought. The United States Geological Survey had studied the nitrate caves in the southern states which were used as a source of supply by the Confederates during the Civil War. In one cave there were said to be 1,000,000 tons of nitrous earth which contained not over 2 per cent of nitrate, a very low amount as compared with the minimum grade of material worked in Chili which contained 12 per cent. The Chili deposits were supposed to be approaching exhaustion, but recent surveys showed that at the early 20th century rate of consumption 200 years must elapse before the supply would be exhausted. Certain nitrate lands belonging to the Chilean government were offered for sale, on account of the difficulty of securing efficient management of the manufacturing plants. A large deposit of raw crystalline soda was reported from Lake Magadi in the southern part of British East Africa. This lake has an area of about 324 square miles and contains from 50,000,000 to 200,000,000 tons of sodium carbonate. A plant had been established at this location for the production of soda ash but owing to war conditions it had suspended operations.

**FUEL.** The demand for coal as a fuel and the difficulty of obtaining it in countries where there are no coal mines led to the increased use of substitutes. In Norway where peat was still abundant engineers had studied the problems of economically collecting peat, and the extensive marshes near the industrial centre of Stavanger were found to contain large quantities which it was estimated would supply the demand for years. The price was fixed by the government at \$5.63 a ton (as contrasted with coal at \$33.50 a ton) and sufficient was obtained during the summer to supply the demand for the winter. In Switzerland the same problem was met similarly and the usual defects which in the past had hindered the use of peat or turf as a fuel were overcome by the use of machinery. These defects were the tendency to absorb moisture, thus reducing its heat properties; its easy crumbling, causing wastage of material; its bulk, which involved increased freight charges and the necessity for the enlargement of fireplaces for its use. Machinery would press the turf into compact form while extracting the water. This condition would be obtained by tearing the roots and plant fibres and unequal construction and reducing it to uniform size, and by drying it in the air. The result was to be a

reduction in bulk to one-fifth of the raw material with a specific gravity of 1.2. Furthermore, it would be hard and resistant, and through the formation of a hard and gelatinlike skin, which formed with the drying, the reabsorption of moisture was prevented, making machine-handled turf incomparably better than that which was treated by hand. It was also found that turf could be used in the production of gas with a by-product of ammonia of about 0.4 per cent which could be used as a fertilizer. In the United States the inoculating of peat with a nitrifying bacteria for raising the nitrogen content from the general average of 2 per cent to 10 per cent, or sufficient to make it valuable for use as a fertilizer was being studied by the division of Mineral Technology in the U. S. National Museum. A smokeless fuel was made by the progressive distillation of woodwaste by means of heated and cold gas in Nanaimo, B. C., where an experimental plant was being operated by this method.

**PAPER.** A scientific study of paper pulps was made by the Bureau of Standards (*Technologic Paper* No. 88). Samples of pulps, each representing a different method of preparation, were examined to determine their chemical properties. The loss in weight produced by reagents, causing hydrolysis and oxidation, and the gain in weight when nitrated have been determined with the same pulps. The effect of sunlight, temperature, and ozonized air on the chemical constants of ground wood were ascertained. Much work had been done with the woods from which the pulps are produced and with the pulps themselves in studying the properties of the fibres and in seeking to find means of judging the paper-making value by laboratory tests in advance. The results were scattered over a wide range of chemical literature, and for the most part were concerned with pulps produced in other countries. The work referred to was carried out chiefly with typical American pulps produced by the several well-known methods in order to ascertain their chemical characteristics as far as possible with the few reliable quantitative methods available. The persistent search for new materials for paper stock resulted in the proposal of lalang grass or blade grass of Queensland, Australia. In quality it was said to yield a product within 10 per cent of the Esparto of Spain. The Chinese barr and the Queensland hemp likewise yielded excellent results. The wattle bark used by British tanners was promising for the production of brown paper and the cheaper grades of white or cream papers, such as for newspapers. In France the subject was studied and conclusions were reached that in the future, the modernization of equipment, the utilization of water power (owing to scarcity of coal), and the employment of raw materials from Equatorial Africa (instead of Germany) were desirable for the successful continuation of the industry. It was also proposed to undertake the manufacture of alfa pulp in Algeria by new processes, and this, if successful, would tend to discontinue the importation of alfa paper from England. In Denmark paper for journals was being made from seaweed, and the cost of the process was said to be half that of making paper from wood pulp. In South America, there was a shortage of paper due chiefly to former dependence for supplies from abroad which had been discontinued since the war. The

high prices in 1917 and the scarcity of material led to the utilization of native woods and native fibres for pulp, especially in Brazil, where new mills were erected and the problem was being worked out so that native raw materials can be utilized. In Venezuela a satisfactory grade of paper was being made from native grasses. The famous Kraft paper, conceded to be the strongest and most economical wrapping paper known, was formerly made only in eastern Canada, but a plant was established at Port Mellon on Howe Sound, British Columbia, for its manufacture. Kraft paper is made from pulp obtained by an alkali process from Douglas fir, spruce, hemlock, cypress, cotton-wood, and other coniferous woods. The process used is particularly adapted to the economical conversion of what would otherwise be waste wood from saw mills into pulp and eventually into the stronger paper which has about twice the strength of Manila paper of equal weight.

**EXPLOSIVES.** One of the by-products from the coffee berry husk is manita which if properly combined with nitrogen makes an explosive of about the same power as dynamite or mercury fulminate.

**SUGAR.** The chemists working in coöperation with the Council of National Defense announced in July the discovery of a secret process for the manufacture of glycerine from sugar which if practicable would reduce the cost of explosives and be of value in the conservation of fats. The announcement of a new process by means of which sucrose might be recovered from final molasses came from the Hawaiian Islands. The principle on which the inventor had worked was that it is not the glucose gums or ash but solely the water in molasses that has prevented the sucrose therein from crystallizing. Removing the water is the only method by which it can be made to give up its sucrose, he believed. This is the first step in the process—boiling the molasses to a practically complete absence of water. The next important departure in the new process is the use of a high-speed centrifugal. Experiments in the use of carbons for decolorizing sugar products made in London especially with secret carbons known as "eponite" and "norite" showed that the addition of starch mucilage to wood treated with calcium acetate increases the decolorizing power, and charcoals were made from pine and cedar wood with this addition to the calcium-acetate process. The decolorizing power was thereby increased, but subsequent comparison with eponite showed that the latter substance was still superior. During these and other experiments the conclusion was reached that the temperature employed was not sufficiently high. Efforts are now made to encourage the production of beet sugar in Great Britain, but so far without any appreciable results. It is generally admitted that sugar beet can be successfully grown in that country, and it is claimed by experts that the English beet contains a larger percentage of sugar than that grown on the Continent.

**ARTIFICIAL TEXTILES.** It was reported from Germany that the spinning and weaving industries had been very active during the year. Many new textiles were produced from artificial fibres that hitherto had been considered worthless. Paper was finding an increasing use in the manufacture of clothing. The activity of the artificial silk industry also was unusually great.

In England yarns and twines occupied the chief attention, although the advisability was considered of using a paper lining for wool bags, or even a bale composed entirely of paper, in order to obviate the trouble caused by minute particles of jute or hemp getting into the wool during transit or storage. Such particles were difficult to detect, and often had remained concealed until the dyeing of the cloth, when by reason of vegetable fibres taking different dyes from wool of similar animal fibres, a pronounced line or defect appeared in the fabric. Paper would dissolve in the process of manufacture, or in some instances paper linings of bright hues could be used and particles therefrom would immediately be discernible in the wool. The uniforms of German prisoners analyzed in England showed the material to be made of a union of cotton, shoddy, and paper. In Argentina a concession was sought from the government for the manufacture of sisal twine, cordage, bagging, sacks, etc., from native fibres. After exhausting the existing wild fibres, it was proposed to cultivate agave and similar fibres for the purpose mentioned.

**ARTIFICIAL MILK.** There was patented in England an artificial milk for human consumption which may be prepared as follows: In 200 pints of pure water at 80° C. are dissolved 400 grains of potassium phosphate, or the equivalent amount of sodium phosphate; sufficient sugar is added to give 4.5 per cent to the finished milk and 40 pounds of meal prepared from peanuts or soya beans, blanched. The solution is boiled in a steam-jacketed pan, then subjected to the operation of a vacuum pan and finally treated with a culture of lactic bacteria until the required acidity is obtained. It is afterwards pasteurized at 60 degrees to 70 degrees C. for at least 20 minutes, cooled and stirred, while 0.05 per cent of citric acid is added. The milk so produced may be condensed and sold in tins in the usual way or dried to a powder and sold in bottles. It may be given a certain percentage of cream by the addition of coconut or one of the other tasteless nut fats, the fat being added when the substance is in the vacuum pan.

**A NEW ANESTHETIC.** Gordon Edwards of San Francisco, Cal., has invented an anesthetic composed of quinine, hydrochloric acid, and urea which he has named *nikalgen*. It is sprayed on the open wound from an atomizer and has been extensively used by the Allies in base hospitals.

**GLASS.** The persistent efforts of the experts in the Bureau of Standards and elsewhere succeeded in producing a satisfactory quality of optical glass so that in May Secretary Redfield announced that henceforth the United States would "be independent of any foreign supply of this important element of warfare." The best material formerly came from Germany. The glass industry in England was in a most unsatisfactory condition prior to the war owing to foreign competition but both for chemical glassware and optical glass the industry was revived and in 1917 was reported to be in a flourishing condition.

**NEW GASOLINE PROCESSES** The Rittman process for transforming a large proportion of the residues of petroleum refineries into gasoline, benzene, and toluene, which was referred to in the *YEAR BOOK* for 1916 (p. 136) by 1917, ac-

cording to Prof. Thomas H. Norton had "issued from the experimental stage and taken its position as a recognized industrial asset in the nation's cycle of productive activity. By its aid vast quantities of petroleum waste, hitherto available for little beyond fuel purposes, can be transformed at will either into gasoline for use in motor engines or into benzene and toluene, also susceptible of the same utilization but constituting likewise the crude material for the manufacture of the two coal-tar high explosives—picric acid and trinitrotoluene—and forming also the starting points for the synthesis of an almost endless variety of dyestuffs, medicinals, photographic chemicals, artificial flavors, and perfumes." Louis B. Cherry of Kansas City, Mo., submitted to the authorities at Washington a new method for converting kerosene into gasoline at a cost, the inventor says, of less than one cent a gallon. The process was described as electro-magnetic, and in a test plant at Coffeyville, Kan., 78 per cent of kerosene was converted into a water-like gasoline of sufficiently high quality to run a motor.

**Motor Fuel.** The use of coal gas as a motor fuel on account of the restriction in the use of gasoline, is growing in Great Britain. In lieu of the former steel tank used as a container a canvas bag with an inner layer of rubber shaped like a mattress is substituted. It holds the gas drawn from the main and is strapped to the top of the motor omnibus or to the rear of the automobile. Experiments seem to show that the equivalent of a gallon of gasoline is about 300 cubic feet of gas. In practice it would seem as if coal gas would show appreciable economy as compared with gasoline, as at normal prices gas costing 16 cents would do the work of a gallon of gasoline. From Birmingham comes the statement that already 500,000 gallons of gasoline a year had been replaced by gas, and that this quantity was being steadily increased as the use of the new fuel grew. The only complaint made was against the size of the bulky containers. It was suggested that a small supply of acetylene gas that could be regulated and mixed with coal gas at the carbureter would strengthen the explosion and supply the necessary "kick." Along the lines of *Natalite*, mentioned in the *YEAR BOOK* for 1916 (p. 135), there was being made in Hyderabad, India, a motor spirit from the mahua plant. It costs about half that of the ordinary petrol, and as the raw material is plentiful, the quantity for annual consumption of motor fuel in the province can readily be had.

**DYESTUFFS.** Persistent search for natural dyestuffs that could be used in place of artificial compounds led to the announcement of a discovery by means of which the brilliant colors of autumnal leaves could be made available and a demonstration was made of every possible shade from glistening gold to the darkest seal brown, including grays and taupes. This process has been patented. A new dye material called "*algarrobin*" from the wood of the carob tree was exploited in Argentina. Its chief use has been in dyeing khaki cloth for Argentina military uniforms. The dyeing properties of *algarrobin* as well as its fastness to fulling, light washing, etc., render it valuable. Alone it imparts a light brown color to any textile fibre, cotton or silk, which may be fixed by appropriate mordants, according to the shade desired. In combination

with vegetable extracts, such as fustic, hyperic, logwood, etc., it gives a number of varied and fast colors.

**Dyestuff Situation in the United States.** The commercial supremacy of the United States in this branch of industry seemed more and more likely to be permanently established. The National Aniline and Chemical Company, consisting of the Schoellkopf Aniline and Chemical Works, the W. Beckers Aniline and Chemical Works, the National Aniline and Chemical Company, the Benzol Products Company, the Barrett Company, and the Semet-Solvay Company, was organized in June. The plants of the company are in Buffalo, Brooklyn, and Wappingers Falls, N. Y., Easton, Marcus Hook, and Frankford, Penn. The aim of the management was to manufacture coal tar dyes and intermediates which could compete successfully, both in quality and variety with those heretofore imported. As the constituent units of the new company included manufacturers of raw materials, of intermediates, and of coal-tar dyes, the company in one organization covered the industry from raw material to finished products. Later came the statement that the E. I. du Pont de Nemours' Company in Wilmington, Del., had decided to enter the coal-tar dye industry for the manufacture of synthetic dyestuffs and kindred products. It was believed that the du Pont concern would produce alizarin, synthetic indigo, eosine and derived colors, rhodamines, and various minor groups of azo colors, sulphur colors, and vat colors, the latter as yet practically undeveloped in the United States. As interpreted by some, the restoration of peace may find the National Aniline and Chemical Company closely affiliated with the big German producing companies, either in an active working agreement or other arrangements of a mutually advantageous character. On the other hand it was claimed that the du Pont Company had arranged to supply permanently the government-aided coal-tar dyestuff industries of England, France, and Italy with such intermediates as might be required to render these industries absolutely independent of Germany in the future for such products. These European government subsidized concerns were known, respectively, as British Dyes, Limited, Société Nationale des Matières Colorantes, and the Italian National Dyestuff Company.

Of all the industries created or developed as a direct result of war conditions, none had shown more rapid progress than American dyestuffs. From only 7 establishments, in which 524 people were engaged in producing 6,619,729 pounds of coal-tar colors, valued at \$1,126,699 in 1914, the industry had developed until at the end of 1917 it not only supplied the domestic demand for colors, but had even invaded the foreign market in European neutral and allied countries including Canada, Mexico, Argentina, Brazil, British India, and Japan. A questionnaire concerning the dyestuff industry sent out in June by the Bureau of Foreign and Domestic Commerce resulted in showing invested capital in this industry, amounting to \$158,913,650 and it was believed that if full and accurate data were obtained an estimate of \$200,000,000 "would be too conservative." The current monthly production of 46 manufacturers of finished dyes was reported to be at the rate of 5,000,000 pounds a month or 60,000,000

pounds annually, individual outputs ranging from 600 to over 2,000,000 pounds each.

In November the statement was made by high authority that "American colors are made from practically the same chemical formulas as those of Europe and are practically the same product in every way. The situation is at present very satisfactory and every American consumer should be able to procure practically everything he needs for next year." Also it was understood by the public that American colors were not as fast as European colors, but no manufacturer or retailer ever guaranteed colors before the war. "Fancy colors which women usually want in silk, such as pinks, light blues, light greens, and heliotrope, were never fast, and as far as I know there never have been any dyes which would make them fast. The word 'fast' is more or less of a misnomer, as a color which is absolutely fast to everything is practically unknown." The reason for the high prices in 1917 charged for American-made dyes was not due to the fact that labor was higher in America than in Europe, but to abnormal conditions generally and the higher price of raw materials, the raw materials used in dye-making being practically the same as those used in the manufacture of munitions. The prices of American colors should be normal after the war.

**Dyestuff Situation in Europe.** In the Trade Supplement of the London *Times* for October, the conditions in chemicals and dyestuffs were reviewed and the claim made that "better supplies of dyestuffs than formerly are now available in this country" and that "there has been a distinct improvement from every point of view." Many of the essential colors of the dyeing trades were still lacking, but there was also an increasing supply of natural products. At the annual meeting of the Bradford Dyers' Association an improved condition was reported and also that the volume of business was "vastly greater than in 1915." Indeed, it was said that "after two and a half years of war so far from our industries having collapsed, they are in a more flourishing condition than in any previous period of our history"; also "with the exception of America, Great Britain is at the moment the only serious producer of dyed textiles for export." From another source it was learned that ultramarine was being produced in Hull, and that synthetic indigo was being made in England. There was still a shortage of cotton yarns but large quantities of it were being imported from the United States, especially of the finer shades. England still exported to Switzerland (chiefly) and elsewhere, aniline oil, toluidine, and other crudes.

In order to supply requirements and to combat foreign supremacy in the dyestuff industry after the war, a new company was floated in Paris under the title *Compagnie Nationale de Matières Colorantes et de Produits Chimiques*. Its capital was fixed at \$7,720,000 in shares of \$96.50 each, of which 60,000 shares were offered for public subscription. The other 20,000 shares were taken up by the promoters, among whom were leading textile manufacturers, chemical producers, and the head of the firm, the *Blanchisserie de Thaon*, which, prior to the war, held a practical monopoly in the French finishing trade for textiles of wool and cotton. The growth of the dyestuff companies in Japan caused an oversupply of certain dyes in the local market.

When the war started the local dyers suffered, but the establishment of many companies and the large increase in output flooded the market and a petition was presented to the government to cancel the ban on exports. Black dyes and sulphuric dyes were also tending to be overstocked.

**PROGRESS OF INDUSTRIAL CHEMISTRY IN EUROPE.** In England the importance of utilizing waste food, particularly fat and bones, and other organic waste, and also waste paper, cardboard, etc., was realized by the government and efforts were being made to stop this loss. The bones and fat were used for the production of glycerine for munition purposes and the paper was converted into paper pulp. The Huddersfield Technical School installed new equipment and provided new courses in coal-tar chemistry, textile industries, and engineering.

In order to facilitate the resumption of industrial activity in the invaded district of France a bill was prepared that provided for the opening of a credit of \$20,000,000 and authorized the government to make expenditures of \$50,000,000 for the accumulation of industrial equipment and appliances for the resumption of industrial activities. This stock was to include raw material and goods sufficient to meet the first requirements on the resumption of operations after the war.

From Switzerland reports showed improved conditions. The shortage of raw materials was relieved by shipments from the United States and new local products. The shortage of hydrochloric, nitric, and sulphuric acids prevented the output of ammunition from being as great as desired, but a new factory for acids was constructed near Basel, which would supply this want. A new soda factory in Zurzach was opened in August. Smaller shipments of coal-tar dyes and of indigo to the United States were noted.

In Germany of paramount importance was the great consolidation of the dyestuff interests which seemed to threaten the infant industries in this line in the United States and elsewhere; for since 1914 dyestuff plants had been established in France, Italy, and Russia. The Haber process for the extraction of nitrogen from the air and the production of synthetic ammonia and ammonium sulphate had increased from 30,000 tons in 1913 to an estimated amount of 500,000 tons for 1917. In the field of chemistry according to Roth in the *Düsseldorf Anzeiger* "rapid advances have been made from the laboratory to the manufacturing stage in the synthetic production of important organic compounds, as well as of such war material as rubber and explosives. Above all, the chemical conquest of the air for agriculture has made great progress. The business of extracting nitrogen from the atmosphere has been so successful that in 1917 the government will be able to dispose of 5,000,000 tons of nitrous manure, which is four times the amount needed in peace time. The equally difficult problems of the production of glycerin, toluol, benzol, and sulphuric acid have also been solved." The *Neue Zeitung* of Zurich published a review of German activities in industrial processes and said that in the metal industry further progress had been made with the production of substitutes for copper, brass, and bronze, special mention being made of zinc and lead alloys and of the increasing

importance of aluminum. There had been new developments in ore smelting. With copper schists the metallurgical possibility of going as low as 0.7 per cent had been shown, whereas formerly the average lower limit was 2.5 per cent. Operations had been begun upon large deposits of sandstone containing white lead. Successful experiments had been made in obtaining aluminum from clay, which would make Germany independent of foreign bauxite in future. With nickel ores the workable limit had been reduced from 2.5 to 1.5 per cent. A process had also been discovered for obtaining nickel and cobalt from pit waters containing these metals.

Reports from Russia showed that chemical factories had been built near the sources of supply of raw materials and coal, materially changing the trend of the industry, which, prior to the war, was being developed near the Russian-German frontier, and involved the use of large quantities of raw materials from Germany. Of special note was the production of chemicals used for the preparation of explosive materials and artificial dyes, toward the increase of which the government and industrial and educational circles were bending their efforts. The same may be said of pharmaceutical preparations; the production of an entire series of products was put on a solid basis. The total production of the old and new factories should run considerably in excess of Russia's production prior to the war.

Until Italy's entrance into the war, the trade in acids, sulphates, oxides, carbonates, nitrates, etc., was with Germany. The war forced Italy to manufacture many articles, but a large market will be open at the close of hostilities.

As South Africa was compelled to import practically all of its chemicals in order to develop its great natural resources considerable agitation was had during the year in favor of establishing chemical industries in that territory.

It has been pointed out that there was a remarkable development of chemical products manufactured in Chile. Chile in 1917 had 100 factories of more or less importance in this industry. Formerly nearly \$2,000,000 worth of chemical and pharmaceutical products were imported; in 1917 Chile imported less than half of this amount, as the country supplied a large share of the local demands.

From an interview with a leading Japanese chemist it appeared that the list of chemicals being manufactured in Japan was rapidly increasing. Her domestic demand was large and growing and she was also beginning to export her products. A chemical field which Japan had conquered was that of safety matches. Plants for the manufacture of potassium chlorate had sprung up. The kelp of the seacoast seemed almost inexhaustible, and from its reduction potassium chloride and iodine were saved. The immense water-power available afforded cheap electric energy for converting the chloride into chlorate. The yellow and red or amorphous phosphorus was obtained from bones and phosphates. Artificial fertilizers were among the established enterprises. Japan makes sulphuric, nitric, and hydrochloric acids, morphine salts, salicylic bromide, atropine salts, bromide salts, creosote, and chloroform. The manufacture of salicylic and carbolic acids was under way. For-

malin and celluloid were made in commercial quantities. Cyanides were manufactured and nitrogen from the air was in process of extraction.

**ASPHYXIATING GASES.** The newspapers in May announced the invention of a lachrymose or tear gas by Robert W. Wood of the Johns Hopkins University. According to the author it was essentially a benzyl-bromide or chloroacetone vapor that produces temporary blindness but no permanent injury. It was turned over to the French War Department. In August the Germans in an attack on Armentières used shells that contained a colorless liquid that spread over the ground. Only very slightly volatile it left traces for hours after the shell had exploded. It evaporated very slowly, producing a heavy gas which filtered downward and reached the cellars where refuge had been sought. This gas, remarkably tenacious, had an odor that was described by some as recalling acetylene, by others as resembling mignonette, but the majority said it was like hot mustard. It takes some time to produce its effects. It had made more victims among women than among men, because it penetrated the hair and remained there, while tobacco smoke had proved an unexpected protection for men. French investigation tended to show that it was not a new thing but a mixture of sulphur and chlorine, already studied and known, but never before used in this manner. The proportion of deaths to the number of people affected was not more than 1 per cent, but the number of people affected might be very great.

The Ordnance division of the U. S. Army sought the advice of chemical experts on gas and flame innovations and a special committee of chemists to study the subject was appointed. A special course of instruction on this subject was established at the Army Gas School at Fort Sill, Okla.

**CHESS.** The twentieth annual intercollegiate chess championship was won by Columbia for the second year in succession, with 9½ points. Yale was second with 6 points, Harvard third with 5 and Princeton last with 3½. The Columbia team comprised Wolfson, Isaacson, Sterman and Clapp.

The Rice Progressive Chess Club of Manhattan Borough, New York, captured the Metropolitan title with six victories and no defeats. The Manhattan Club finished second with 5 matches won and 1 lost and the Staten Island Club third with 4 matches won and 2 lost.

In the masters' tournament A. Kupchik, New York, was the victor, J. Bernstein and O. Chajes being tied for second honors. E. L. Gluck was the winner of the general tournament, first class, while Henry Ring and J. F. Engel tied for first place in the second class competition. K. B. Allured won the third class laurels.

Edward Lasker of Chicago won the Western championship with 6½ victories and 1½ defeats. J. W. Showalter of Georgetown, Ky., and J. Winter of Detroit were tied for second with 4½ games won and 3½ games lost.

C. S. Howell, a New York player, triumphed in the tournament held by the Havana, Cuba, Chess Club by a score of 3½ to 2½. Juan Corzo of Cuba took second honors with a total of 3 victories and 3 defeats.

**CHESTNUT BLIGHT.** See BOTANY, *Plant Diseases*.

**CHICAGO.** See DOCKS AND HARBORS; ILLINOIS; RAPID TRANSIT.

**CHICAGO, UNIVERSITY OF.** A co-educational, non-sectarian institution of higher learning in Chicago, Ill. In the fall of 1917 there was 4335 students and 303 members of the faculty exclusive of assistants. Volumes in the library numbered 517,936. Productive funds in 1917 amounted to \$23,283,563 and the income to \$1,294,566. The University was founded in 1891 largely through gifts by John D. Rockefeller and since then has been greatly indebted to him for maintenance. In 1917 among the gifts for endowment there was received from Mr. Rockefeller \$799,921, a part of the seventh installment of his final gift of ten million dollars. Of this amount \$200,000 was set aside toward the cost of a proposed chapel. Other gifts include \$232,417 toward endowment of the Chicago Medical School; nearly \$16,000 for prizes and the endowment of fellowships and scholarships; and \$775,000 for new buildings, of which \$300,000 was from the Billings family for the Albert Merritt Billings Memorial Hospital, \$50,000 was from Mrs. Joseph Bond for a chapel for the Divinity School, and \$150,000 was received from a friend for a Theology building. President, Harry P. Judson, LL.D.

**CHILD LABOR.** The important aspects of the child labor problem during 1917 were the inauguration of the Federal Child Labor Law and the tendency to break down compulsory education and child labor laws because of the scarcity of labor. This latter problem had become serious in England, France, and Germany two years earlier and in all of them there had been a very marked lessening of educational effort and a concurrent recruiting to the ranks of labor of large numbers of children who in times of peace would have secured the advantages of further education.

THE NATIONAL CHILD LABOR COMMITTEE held its 13th annual conference at Baltimore, March 23-25. Various aspects of child labor legislation, of the enforcement of child labor laws and problems of war time were discussed. This committee gave extended attention to the efforts being made to draw children to farms and truck gardens even at the sacrifice of educational opportunities. It suggested that for younger children teachers, boy scout leaders, playground directors, and others interested in child welfare should form themselves into summer agricultural faculties for the purpose of utilizing idle children in the cultivation of vacant city lots or suburban property. For older children they suggested the creation of a state committee which should coöperate with farmers in securing the employment of boys and girls suited to agricultural work. However, the committee suggested that only children 14 years of age and over should be permitted to work on farms for others than their parents; that for this purpose they should be excused from school from June 1 to October 1 only; that they should not be allowed to work more than 8 hours a day, nor for more than 6 days a week; that such children must secure special work certificates based in part upon a physician's report that they were physically unable to endure the strain of farm labor. The committee held strongly that the transportation, feeding, and housing of such agricultural laborers should be under public supervision. It pointed out that

England had learned belatedly that the suspension of child labor laws and the breaking down of educational training was disastrous and that America would do well to learn by England's experience.

One of the investigations carried out by the committee dealt with the relation between school attendance and farm labor by children in Oklahoma. A number of its agents were sent to that State and made extensive inquiries. It was found that in rural districts the children of tenant farmers outnumbered the children of farm owners by 3 to 2, and that over half of the children of tenants belonged to "migrant" families. Six thousand children were studied in detail. It was found that on an average each farm working tenant's boy missed 42.2 days of school of which 35.5 days were spent at farm work; on an average the boys of farm owners lost 35.6 days of school of which 26.3 were spent in farm work; the boys of hired laborers lost on an average of 29.6 school days of which 23.1 were spent at farm work. These boys and girls lost a total of 185,707 school days out of 800,442. Farm work accounted for 73,121 days; illness for 44,148; and other causes, primarily parental indifference, for 26,382. Of those working on farms 51.1 per cent were retarded in school. It was found that even the low standard for compulsory education required by the Oklahoma law was far from realized in practice.

**NATIONAL CHILD LABOR LAW.** The Keating-Owen Law, otherwise known as the Federal Child Labor Law, became effective September 1, 1917. It was enacted under the interstate commerce clause of the Constitution and consequently applied only to goods produced for shipment in interstate commerce. In substance this law prohibited the shipment in interstate commerce within 30 days after production of any goods produced by children under 16 employed in mine or quarry; by children under 14 in any industry; or by children under 16 working more than 8 hours per day or 6 days per week or before 6 a.m. or after 7 p.m. in any mill, cannery, work-shop, factory, or manufacturing establishment. It was pointed out that this statute applied to only 150,000 of the 2,000,000 children under 16 employed in American industries. Nevertheless the act was expected to affect many other children indirectly by hastening the standardization of the laws of the 48 States and by stimulating the perfection of methods and machinery for administration and enforcement.

The law provided that the Secretaries of Commerce and Labor with the Attorney-General should constitute an administrative board with ultimate responsibility in the administration of the law. Immediate responsibility was given to the Children's Bureau of the Labor Department under Miss Julia Lathrop; in this Bureau a Child Labor Division was organized under the direction of Miss Grace Abbott. Late in February letters were sent to the governors of the States asking that legislative action be taken to avoid duplication in requirements for proof of age. It was pointed out that the States might either enact in their laws the requirements established by the Administrative Board or might authorize a committee of State officials to draw up regulations subsequently to be approved by the Administrative Board. In July there was held at Washington a conference of

producers, manufacturers, and dealers, for the discussion of rules and regulations. These dealt with proofs of age, conditions for the acceptance of State certificates by the Federal authorities, and the forms of guaranty whereby employers may protect themselves from prosecution. In view of the war situation efforts were made in various quarters to secure a suspension of the act or a postponement of its inauguration, but this activity met with little favor either in Congress or from the public, though a bill to that effect was introduced in the House.

The *constitutionality* of the law was attacked in an injunction suit before the Federal District Court in North Carolina. This suit was brought by one Roland H. Dagenhart in behalf of his two sons. Hearings were held August 29, 30, and 31. On the latter date Judge Boyd of the Federal Court for the Western District of North Carolina held the law unconstitutional. This suit was pressed by the Southern Cotton Manufacturers' Association and defended by the National Child Labor Committee and the Federal government. Representing the mill owners were important law firms of New York and North Carolina. Representing the government were District Attorney Hammer, T. I. Parkinson of the Legislative Drafting Fund of Columbia University, and Roscoe Pound, Dean of the Harvard Law School. Judge Boyd's decision declared that the law deprived the parent of the property right in the services of his children. His opinion declared that the law was an effort on the part of Congress to control manufacturing within States by an undue extension of its power to control commerce between States. Appeal was taken to the United States Supreme Court.

**OTHER LEGISLATION.** Very little advance was made in child labor legislation in 1917. This was primarily owing to the war situation. The main effort in fact of those interested in raising the standards of child labor laws was directed toward the prevention of the suspension of laws and standards already in existence. In spite of these efforts, however, various States took steps toward a relaxation of child labor restrictions. Connecticut and New Hampshire authorized their governors to suspend any labor laws during the continuance of the war at the request of the Council of National Defense. In Vermont a similar power was given to the commissioner of industries with the approval of the governor. In Massachusetts a committee of five to be appointed by the Board of Labor and Industries with the approval of the governor was authorized to grant permits for the suspension of labor laws after hearing. In California the State Board of Education was empowered with the approval of the governor to reduce the school term to 6 months, when deemed necessary "for the planting or harvesting of crops or for other agricultural or horticultural purposes." The New York Commissioner of Education was given authority to suspend the compulsory educational law from April 1 to November 1 "for the purpose of aiding and permitting labor in the cultivation, production, and care of food products and gardens within the State;" the commissioner, however, was authorized to lay down the rules under which children might be excused from school for such labor. On the other hand, on February 1 a law of 1916 became effective in New York State whereby children under 15

seeking employment must be graduates of elementary schools. Those not graduates must remain in school until their 15th birthday; and if they have not completed the first 6 grades of the public schools they must remain in school until their 16th birthday. This law was due in part to the extensive recruiting of child labor during 1916. It was found that 61,000 more children were employed in 1916 than in 1915, an increase of 27 per cent. It was expected that the new law would force from one-fourth to one-third of these back for more schooling. Delaware, Illinois, and Kansas raised the educational requirements for work certificates and otherwise improved the administrative aspects of work permits. Tennessee and Vermont enacted laws similar to the Federal act, providing an eight-hour day, no night work, a 14-year limit for factories, work shops and canneries, and a 16-year limit for mines and quarries. North Carolina raised its compulsory educational limit from 12 to 14 years and South Carolina from 14 to 16 years.

**EUROPE.** Statistics regarding the employment of children in Europe since the war began are almost entirely wanting. Mr. Owen R. Lovejoy, General Secretary of the National Child Labor Committee (the *Child Labor Bulletin*, May, 1917) showed from various indications that in France children have been placed in many kinds of manufacturing and agriculture; that in Russia the employment of children in factories and fields is widespread, and that similar statements may be made of Hungary, Austria, Germany, Italy, and England. From the latter country alone was more exact information available. Mrs. Sidney Webb estimated that while over 15,000 children had been formally exempted from school in 1916 more than 50,000 others had left school for work without special exemption. Sir James Yoxall believed that in all between 150,000 and 200,000 children between 11 and 13 had left school to go to work. Approximately 500,000 children between 12 and 15 or 45,000 more than the normal number left school in 1915 to go to work and this number was probably far greater in 1916. In addition great numbers of schools have been wholly or partially suspended, it being estimated that at least 300,000 children formerly attending school were thus excluded. There was a marked increase of juvenile delinquency in London, Manchester, and Edinburgh. The abnormal demand for labor resulted in unusually high wages for children. Many thousands of children 10 to 14 years of age were released from school for work on farms. Many other thousands were drawn into munitions factories. The Committee on Health of Munitions Workers declared that many of these were having their health and vitality sapped by the excessive drain of war work. Consult *The Child Labor Bulletin* and *Annual Report* of the National Child Labor Committee. See bibliography under LABOR.

**CHILDREN'S COURTS.** See JUVENILE COURTS.

**CHILE.** A republic of South America, extending along the Pacific coast southward from Peru. The capital is Santiago.

**AREA AND POPULATION.** Chile is a long, narrow country lying between the Andean crest and the Pacific. Its length, from the Peruvian border to the southern limits of South America, is about 4230 kilometres (2628 miles); its width, though varying, may be stated as approximately

285 kilometres (177 miles). The country is divided into 23 provinces and one territory. The total area is estimated at 750,572 square kilometres (289,796 square miles); this is about five times the area of the State of Michigan. The census of November 27, 1907, returned a population of 3,249,279; of these, Chileans numbered 3,114,755 (1,531,844 males, 1,582,911 females), and foreigners 134,524 (92,377 males, 42,147 females). In 1907, about 43.3 per cent of the population was returned as urban, compared with 38.6 per cent in 1895 and 34.3 per cent in 1885. The population as calculated for January 1, 1916, was 3,789,864; for January 1, 1917, 3,870,002.

About one-fourth of the people are of pure Spanish stock, and the remainder either mestizo or pure Indian. Following are the principal cities and towns, with population calculated for January 1, 1916, and the average annual increase per cent from the 1907 census to 1916: Santiago, 397,550 (2.25 per cent); Valparaíso, 201,507 (2.73); Concepción, 68,902 (2.78); Antofagasta, 56,295 (7.11); Iquique, 45,502 (1.57); Talca, 41,618 (1.13); Chillán, 38,543 (1.48); Viña del Mar, 32,577 (2.73); Temuco, 27,616 (7.03); Valdivia, 23,464 (5.45); Talcahuano, 21,876 (4.35); Curicó, 21,849 (2.76); Punta Arenas, 20,235 (6.53); Coquimbo, 16,902 (4.26); Serena, 16,128 (0.13); Talta, 15,665 (3.97); Rancagua, 15,449 (3.76); Los Angeles, 15,217 (3.35); Linares, 14,668 (3.53); Quillota, 12,857 (1.46); Victoria, 12,131 (2.89); Lota, 11,584 (0.96); San Bernardo, 11,502 (5.22); Tacna, 11,453 (2.67); Parral, 11,149 (1.31).

Below are shown for five years marriages, births, and deaths, by number and by rate per thousand inhabitants:

	Marriages		Births		Deaths	
	No.	Rate	No.	Rate	No.	Rate
1912	21,258	6.1	135,373	38.7	103,905	29.7
1913	21,461	6.0	140,525	39.4	107,200	30.3
1914	19,002	5.2	138,550	37.5	100,059	27.5
1915	19,150	5.2	136,597	36.8	98,716	26.0
1916	20,121	5.3	144,193	38.0	99,856	26.3

Of the total births in 1916, 74,235 were male and 69,958 female. Illegitimate births numbered 54,987 (38.13 per cent). In twenty years, that is, from 1896 to 1916, the proportion of illegitimate births increased from 33.2 per cent to 38.1 per cent.

**EDUCATION.** Of the population at the 1907 census, 1,298,218 could read, that is, 40 per cent, or 42.0 per cent of the males and 37.9 per cent of the females. In 1895, only 31.8 per cent of the inhabitants could read, or 34.3 per cent of the males and 29.2 per cent of the females. Primary instruction is free, but not compulsory. In 1916, the number of pupils who received primary instruction in public schools was 356,846; in subventioned private schools, 51,085; in non-subventioned private schools, 8999; total, 416,930 (214,361 males, 202,569 females). Pupils receiving primary instruction increased from 355,869 in 1912 to 393,306 in 1914 and 416,930 in 1916. Average attendance in the public primary schools increased from 169,739 in 1912 to 190,469 in 1914 and 208,246 in 1916. Public primary schools in 1916 numbered 2927, with 6365 teachers. In 1916, the number of persons who received secondary instruction in public schools was 16,835; in subventioned pri-

vate schools, 10,755; in non-subsventioned private schools, 8133; total, 35,723, as compared with 30,265 in 1912. In 1916, public lycées for males numbered 42, with 832 teachers and 16,435 students (including 5911 preparatory); public lycées for females, 44, with 725 teachers and 11,816 students (of whom 5505 preparatory); 9 seminaries, with 1923 students (of whom 635 preparatory); 78 subventioned secondary schools, with 10,451 students; 46 non-subsventioned secondary schools, with 558 teachers and 8133 students. There are also normal, commercial, technical, and professional schools. There are two universities, the government University of Chile and the Catholic University, which in 1915 had over 4300 students. In 1916 the University of Chile conferred 1103 degrees. The National Library in 1916 contained 206,773 volumes. The state religion is Roman Catholicism, but the public exercise of other forms of worship is permitted.

**PRODUCTION.** In 1916, farm land aggregated 13,303,706 hectares. Land planted to crops amounted to 689,214 hectares, of which 597,483 hectares under cereals, 58,889 under legumes, 31,890 under potatoes; in artificially sown meadow, 1,720,215 hectares; under vines, 56,227. Yields in metric quintals in 1915 and 1916 respectively: Wheat, 5,170,973 and 5,493,149; rye, 47,063 and 47,428; barley, 833,283 and 948,818; oats, 1,031,156 and 921,777; corn, 467,841 and 398,863; beans, 511,342 and 520,923; vetches, 99,940 and 117,712; chick peas, 14,584 and 12,808; lentils, 13,768 and 9694; potatoes, 2,597,964 and 3,156,512. Live stock in 1916: horses, 442,642; asses, 36,561; mules, 39,313; cattle, 1,869,053; sheep, 4,557,800; goats, 385,941; swine, 258,025; llamas, 26,600; alpacas, 14,856. Of the sheep, 2,061,998 were in the Territory of Magallanes; of the llamas, 18,326, and of the alpacas, 14,698, in the Province of Tacna.

Chile's prosperity is due in considerable degree to the exploitation of her enormous deposits of sodium nitrate, the export tax on which provides a large part of the national revenue. In 1915 the value of copper produced was only about 22 per cent of that of the nitrate, but copper stands second in importance. Next is coal, but the output falls considerably short of the domestic demand. Large deposits of iron ore await development. The mineral output of Chile was valued in 1911 at 329,788,655 pesos gold; in 1912, 372,662,774; in 1913, 393,504,215; in 1914, 353,702,700; in 1915, 397,946,395. Values of the principal minerals produced, in thousands of pesos gold, in 1914 and 1915 respectively: nitrate, 283,286 and 201,858; copper, 31,441 and 44,287; coal, 21,739 and 29,289; iodine, 5745 and 11,739; iron, 1270 and 2942; borate, 4467 and 2082; sulphur, 1201 and 1172; salt, 868 and 1059; silver, 1197 and 1006; gold, 556 and 813. Chilean copper output, in metric tons representing fine metal: in 1900, 27,715; in 1905, 29,126; in 1910, 38,232; in 1914, 44,665; in 1915, 52,341. Figures for the great nitrate industry are given below, showing the number of workmen and the production and exportation in metric tons:

	Workmen	Production	Exportation
1900 .....	19,672	1,507,788	1,465,935
1905 .....	.....	1,754,605	1,650,363
1910 .....	48,538	2,465,415	2,335,941
1911 .....	48,876	2,521,028	2,449,515

	Workmen	Production	Exportation
1912 .....	47,800	2,585,850	2,493,082
1913 .....	53,161	2,772,254	2,738,889
1914 .....	48,979	2,463,356	1,846,788
1915 .....	48,508	1,755,291	2,023,294

Nitrate is obtained in the arid northern part of the country. Production by districts in 1915, in metric tons: Pisagua, 257,235; Tarapacá, 362,983; Tocopilla, 200,706; Antofagasta, 797,733; Taltal, 136,634.

**COMMERCE.** Below are shown the values of imports and exports (including coin and bullion), in thousands of pesos gold. The gold peso is worth 18d. sterling, or approximately 36.5 cents.

	1910	1913	1914	1915	1916
Imports ..	297,486	329,518	269,757	153,212	222,521
Exports ..	328,827	869,810	299,675	827,479	513,585

The great war caused a sharp decline in trade through the suspension of Chile's credit in Europe and the destruction of important markets. Recovery, however, was noted in the figures for 1916, especially for exports, which surpass those of any previous year. There was a notable increase in nitrate and bar copper. The principal imports include textile products, machinery, tools, apparatus, oils, coal, provisions, etc. Imports of raw and partly manufactured materials were valued at 40,363,177 pesos in 1915 and 48,954,996 pesos in 1916; manufactures, 111,814,656 and 173,535,289; coin and bullion, 1,035,724 and 30,543; total, 153,211,557 and 222,520,828. Exports of raw and partly manufactured materials, 17,978,261 pesos in 1915 and 16,560,700 pesos in 1916; manufactures, 326,902,028 and 512,493,550; coin and bullion, 577,130 and 1,091,194; total, 327,479,158 and 513,584,744. Principal exports of domestic produce are shown below in metric tons and thousands of pesos:

	1915		1916	
	Tons	1,000 pesos	Tons	1,000 pesos
Nitrate .....	2,023,294	282,679	2,980,278	338,529
Copper .....	53,587	45,410	71,904	86,640
Iodine .....	709	11,789	1,323	21,628
Wool .....	14,205	13,011	18,981	18,768
Hides and skins .....	.....	6,262	.....	5,440
Frozen meat...	15,880	7,192	20,906	12,260

<b>Total, incl. others.</b>	<b>153,212</b>	<b>222,521</b>	<b>327,479</b>	<b>513,584</b>

**COMMUNICATIONS.** The length of Chilean railway in 1915 was 8216 kilometres (5105 miles), according to the official *Sinopsis estadística de la República de Chile*, published at Santiago in 1917. Railway development has been as follows, in kilometres:

	1900	1905	1910	1914	1915
State .....	2,125	2,329	2,830	5,072	5,122
Private .....	2,229	2,449	3,114	3,075	3,094
<b>Total.....</b>	<b>4,354</b>	<b>4,778</b>	<b>5,944</b>	<b>8,147</b>	<b>8,216</b>

In 1916, the greatest length of railway was in the province of Antofagasta, with 2080 kilometres: Atacama, 1080; Tarapacá, 874; Coquimbo, 671. Capital invested in railways in 1915: private lines: Chilean, 19,609,842 pesos gold; British, 223,992,893; German, 1,145,833; total private, 244,748,568; state lines, 348,396,271; grand total, 593,144,839, as compared with 310,615,690 in 1910.

**FINANCE.** The monetary unit is the peso; its par value is 18d. sterling, or approximately 36.5 cents. In the spring of 1917, the Congress enacted a law postponing the conversion of legal tender paper money until January 1, 1919. The paper peso fluctuates in value; in 1915 and 1916 it was about 14 cents; in 1917 it increased, so that on October 31 the exchange rate was approximately 29.6 cents. Revenue and expenditure, excluding receipts and disbursements on account of the state railways, have been as follows, in thousands of pesos gold:

	1901	1906	1911	1914	1915	1916
Rev..	91,788	146,572	165,845	189,389	128,168	183,468
Exp..	103,328	119,128	153,171	153,559	131,840	150,749

Revenues and expenses of the state railways are shown below, in thousands of pesos gold:

	1901	1906	1911	1914	1915	1916
Rev. ...	14,659	19,809	32,357	32,294	37,386	38,957
Exp. ...	16,810	22,648	39,718	38,708	32,648	38,542

Details (excluding railways) of revenue and expenditure, in thousands of pesos gold:

<b>Total.....</b>	<b>153,559</b>	<b>131,840</b>	<b>150,749</b>

Estimated expenditure for 1917: 193,432,264 pesos paper and 69,635,281 pesos gold. The budget for 1918, as submitted to the Congress, showed an estimated expenditure of 191,585,100 pesos paper and 46,141,800 pesos gold. The foreign debt on December 31, 1916, stood at 429,626,600 pesos gold; internal debt, 42,708,193 pesos paper; paper money in circulation, face value, 177,980,119 pesos.

**NAVY.** The Chilean navy includes: 2 old battleships, the *Capitán Prat* (1892), of about 7000 tons, and the *O'Higgins* (1897), of 8500 tons; 1 armored cruiser, the *Esmeralda* (1896), of 7000 tons; 4 protected cruisers (1890-99), aggregating 14,500 tons; various small and auxiliary craft, including several destroyers and torpedo boats. Personnel, about 6000 officers and men.

**GOVERNMENT.** The legislative power is exercised by a congress of two houses, the Senate and the Chamber of Deputies. Senators (37 in number) are elected for six years and deputies (118) for three years by direct vote. The executive authority is vested in a president, who is elected by indirect vote for five years and is ineligible for the next term. The president is assisted by a council of state and a cabinet. The president in 1917 was Juan Luis Sanfuentes, who was inaugurated December 23, 1915, in succession to Ramón Barros Luco.

**HISTORY.** To the suggestion of President Wilson that all neutrals should break off relations with Germany Chile replied on February 9 that it had already expressed its view in a note to the German government declaring that the blockade was against neutral rights, that Chile could not agree and reserved the right to protest against violations of international law. Later when Chile received inquiries from the United States and Cuba as to the existence of a state of war with Germany the Chilean government replied on April 10 that it was its intention to observe strict neutrality. On April 9 it was announced that an eruption of the volcano Calbuco, near the city of Puerto Montt, had taken place, causing great devastation in the farming country and killing many herds of cattle.

**CHINA.** The Chinese Empire was succeeded by the Chinese Republic when, on February 12, 1912, by an edict of the Empress Dowager, Tsu Hsi An, the infant emperor, Pu-yi, abdicated the throne and brought the Manchu dynasty to an end. The dynasty dated from 1644. Pu-yi, who was permitted to retain the title of Manchu Emperor, was born February 11, 1906, nephew of the Emperor Kuang-hsü. The duties of president of the new republic were performed by Yuan Shih-kai, who on October 6, 1913, was regularly elected president by the Chinese Parliament. Yuan died June 6, 1916, and was succeeded by the vice-president, Li Yuan-hung. Peking, the seat of the former Imperial government, is the capital of the republic.

**AREA AND POPULATION.** The republic includes: China proper, "the eighteen provinces;" Manchuria, "the three eastern provinces;" Sinkiang (which includes East Turkestan), the new province, or "the new dominion;" Inner Mongolia; Outer Mongolia, the autonomy of which has been recognized since October, 1913; Tibet, including Koko-Nor and Tsaidam. Only a variable authority is exercised by the Peking government in Inner Mongolia and Tibet. In November, 1917, it was announced that the government had under consideration the redefinition of the fron-

tiers. The following proposals were made: To appoint a special mission to effect a proper boundary between Manchuria and Korea; to negotiate with the Portuguese concerning the boundary of Macao; to dispatch an agent to decide the proper boundary between Inner Mongolia and Outer Mongolia.

Various estimates or enumerations of the populations dwelling within the limits of the republic have been made under governmental authority, but with so complete an ignorance of statistical method that they command little confidence. In China proper the population seems to be increasing very slowly or perhaps not at all. Below are shown the estimated areas and the number of inhabitants as calculated from the 1910 enumeration of households:

	<i>Sq. miles</i>	<i>Population</i>
China proper.....	1,532,789	* 302,111,334
Manchuria .....	362,483	* 12,742,360

\* Not including children under six years.

† Estimate.

The total area stated above is about 141 per cent of continental United States (excluding Alaska); the area given for China proper is about 50 per cent of that of the United States. Much uncertainty exists with respect to the size of Chinese cities. A calculation based on the 1910 enumeration gave Peking about 821,000 inhabitants; but, according to the reported results of a 1912 enumeration, the inhabitants numbered only about 692,500. Estimated population of some of the larger treaty ports: Hankow, 1,321,000; Canton, 900,000; Tientsin, 800,000; Chungking, 702,000; Shanghai, 651,000; Foochow, 624,000; Soochow, 500,000; Ningpo, 455,000; Nanking, 377,000; Changaha, 250,000; Chinkiang, 186,000; Amoy, 114,000. The estimated number of foreigners resident at the treaty ports in 1915 was 182,404, including 101,589 Japanese, 56,230 Russians, 8641 British, 4716 Americans, 3740 Germans, 3300 Portuguese, and 1649 French.

**RELIGION AND EDUCATION.** Most of the Chinese are either Confucianists, Taoists, or Buddhists, but virtually all of the people practice ancestor worship. Under the republic no ecclesiastical hierarchy is maintained, but Confucianism is the basis of ethical teaching in the educational system. The Moslem population numbers between 5,000,000 and 10,000,000. Roman Catholic natives at the end of 1916 were reported at 1,790,220; Protestant natives in 1915, 526,108; Orthodox natives at the end of 1915, 5587.

In 1905 the government undertook the gradual introduction of western learning, with the result that the traditional education in the Chinese classics is being widely superseded by more practical instruction. The Government University at Peking, established in 1909, has about 1500 students (including students in the

preparatory department), with 90 teachers. Also at Peking is the important Union Medical College. Tientsin has a university, an Anglo-Chinese college, and several special schools. There are numerous Roman Catholic and Protestant mission schools in various parts of the country. Educational institutions of all kinds are estimated at about 58,000, with upwards of 1,600,000 pupils and students enrolled.

**INDUSTRIES.** China proper is primarily an agricultural country. Holdings are small, irrigation is common, cultivation is intensive, but the implements used are primitive. The cultivation of fruits and vegetables has reached a high degree of excellence. The principal crops, in the north, include wheat, barley, corn, millet, and other cereals, and beans and peas; in the south, rice, sugar-cane, indigo, and cotton. Also in the south and west important products are tea and silk cocoons, the latter being produced to some extent in all the provinces. The staple product of Manchuria is the soy bean, of which in 1915 614,250 tons were exported as beans and 695,600 tons as bean cake.

Mining has not been highly developed, but the mineral resources are rich and abundant. China is one of the first coal countries in the world in respect of coal deposits, which are found in most of the provinces. The coal output in 1915 was 18,000,000 tons. The most important mineral export is tin, which is mined in Yunnan. Iron is abundant in many localities; the deposits which are worked near Hankow are among the richest in the world. Copper is mined in Yunnan, antimony in Hunan. Other minerals produced are gold, silver, lead, zinc, salt, and petroleum.

The leading manufactures are cotton, silk, and woolen goods. Modern methods of manufacture have been introduced. There is some manufacture of iron and steel, especially at Hanyang, near Hankow. At various places modern flour and rice mills have been erected.

**COMMERCE.** The Chinese foreign trade is reported in haikwan taels. The haikwan tael had an average value of about 65 cents in 1911, 74 cents in 1912, 73 cents in 1913, 67 cents in 1914, 62 cents in 1915, and 83 cents in 1916. The haikwan tael is not a coin, but a unit of weight, and its value fluctuates with the price of silver. In 1916 its value advanced to about 83 cents and by October 1, 1917, to \$1.1851. Total imports and domestic exports (that is, exports of Chinese produce) have been valued as follows, in thousands of haikwan taels (coin and bullion excluded):

	1911	1912	1913	1914	1915
Imports ..	482,576	485,726	586,290	584,209	477,064
Exports ..	377,838	370,520	403,306	356,227	418,861

The most important group of imports into China are textile goods, which in 1915 were valued at hk. ts. 157,482,394; of this amount, hk. ts. 151,437,267 represented cotton goods, including cotton yarn to the value of hk. ts. 67,223,008. Other of the principal imports into China were as follows in 1914 and 1915 respectively, in thousands of haikwan taels: sugar, 31,040 and 29,912; kerosene, 35,119 and 28,027; cereals, 22,349 and 25,695 (chiefly rice and paddy, 22,097 and 25,342); opium, 42,663 and

25,644; metals, 21,191 in 1915 (of which iron and steel 10,990); fishery products, 13,371 and 14,926; cigarettes, 13,704 and 12,235; coal, 9072 and 8416; dyes, colors, and paints, 15,944 and 7256; raw cotton, 2904 and 6874; bags, 3883 and 6427; paper, 6725 and 6376; leather, 6031 and 5586; matches, 5637 and 5284; tea, 5465 and 5243; machinery, 8766 and 4829; clothing, 4849 and 3808; ginseng, 2386 and 3854; medicines, 4271 and 3793; vehicles, 6544 and 3738; timber, 6430 and 3501; railway materials, 6639 and 3468; beans, peas, etc., 2251 and 3325; bran, 2729 and 2989; spirits, wine and beer, 3051 and 2971; soap, 2580 and 2341; electrical apparatus, 2794 and 2085; flour, 9262 and 834.

Principal exports of Chinese produce in 1914 and 1915 respectively, valued in thousands of haikwan taels: raw silk and waste, 62,919 and 78,407; tea, 36,363 and 55,538; silk goods, 16,972 and 22,393; undressed skins and hides, 21,431; bean cake, 22,022 and 20,706; beans, 25,180 and 20,219; vegetable oils, 13,686 and 16,583; seeds, 11,694 and 16,249; raw cotton, 12,715 and 13,700; raw wool, 6715 and 11,129; slab tin, 7979 and 9247; cereals, 7374 and 7679; coal, 8974 and 6074; live animals, 6047 and 5483; bristles, 4440 and 4875; egg albumen and yolk, 2870 and 4865; meats, 3763 and 4330; paper, 2865 and 4261; fibres (hemp, jute, ramia), 2712 and 3630; medicines, 2806 and 3176; tallow (animal and vegetable), 3468 and 3124; straw braid, 3080 and 2863; mats and matting, 3329 and 2776; fire crackers and fire works, 2436 and 2354; groundnuts, 5064 and 2126; grass cloth, 1423 and 1319.

The table below shows some of the leading exports in 1914, 1915, and 1916 by quantity, the figures representing metric quintals:

	1914	1915	1916
Beans, black.....	68,282	94,779	40,066

Total, incl. others. 584,209 477,064 356,227 418,861

SHIPPING. Vessels entered and cleared at Chinese ports in 1915 numbered 206,887, of 90,663,005 tons, as compared with 219,649, of 96,326,267 tons in 1914. Of the 1915 shipping, steamers numbered 103,963, of 84,641,227 tons, and sail 102,924, of 6,021,778 tons. Under the Chinese flag were 141,965 vessels, of 24,159,009 tons; British, 33,339, of 37,675,657 tons; Japanese, 20,141, of 23,873,016 tons; American, 3148, of 804,414 tons; French, 537, of 561,955 tons. In the direct foreign trade, there were entered in 1915 37,599 vessels, of 12,023,320 tons, and cleared 35,617 vessels, of 12,100,590 tons. Of the tonnage entered in the direct foreign trade, British aggregated 4,241,367, Japanese 3,839,336, Chinese 2,613,947.

COMMUNICATIONS. In China proper, roads are numerous and, though most of them are in poor condition, they carry a large internal trade. More important commercially than the roads are the many canals and navigable rivers. The reported length of railway in operation at the beginning of 1914 was 9596 kilometres (5963 miles), including the railways in Manchuria; under construction, 3660 kilometres (2274 miles). During 1917 the American surveyors were engaged in preparing plans for 1500 miles of railway through the richest section of China; especially the provinces of Szechuen, Hunan, and Chihli made considerable progress. A reconnaissance of 1090 miles and the preliminary survey of 540 miles were made on the Chouchiakou-Hsiangyang line from Chouchiakou in Hunan to Hanchungfu in Shensi. The survey was later extended to Chengtu to determine whether the provinces of Szechuen with an estimated population of 70,000,000 could be tapped. The survey of the Chuchow-Chinchow line designed to open up the rich mining territory was completed with 994 reconnaissance miles and 503 preliminary miles, making for the twelve projects, a total of 2084 reconnaissance and 1043 preliminary miles actually surveyed. These lines, when constructed, would be the first to be built west of Peking-Hankow and Hankow-Canton Railways, and would open up six new provinces to foreign trade.

The telegraph system, which is under government control, is well developed, connecting the principal cities with each other and with neighboring countries. The reported length of line at the end of 1914 was 36,339 miles, with 49,963 miles of wire; offices, 561. Wireless telegraphy has been installed, including stations at Peking, Kalgan, Hankow, Shanghai, Nanking, and Canton. The postal system extends over China proper, Manchuria, and Sinkiang. Post offices in 1915, 8511.

FINANCE. The monetary unit is the silver dollar (yuan). It is equivalent to .644 plus of the haikwan tael. The haikwan tael, or customs tael, is somewhat heavier than various local taels. The value of the haikwan tael,

which fluctuates with the price of silver, was \$1.1851 on October 1, 1917; that of the dollar, 70.32 cents. The taels are not coins, but units of weight and hence of value. Current in China are the British and Hongkong silver dollars, valued on October 1, 1917, at 78.60 cents, and the Mexican silver dollar, valued at 77.17 cents.

For the year ending June 30, 1917, the budget balanced at 472,838,584 taels. Estimated revenue: land tax, 90,115,784 taels; customs duties, 73,056,663; salt tax, 96,767,010; tax on merchandise, 42,719,194; total ordinary revenue (including miscellaneous taxes), 388,009,660; extraordinary revenue, 84,828,924; grand total, 472,838,584. The larger estimated disbursements for the fiscal year 1917: war, 156,606,047 taels; finance, 61,792,970; interior, 42,570,109. The total estimated ordinary expenditure was 291,803,470 taels; extraordinary, 181,035,114. Foreign debt December 31, 1916, £171,906,000, of which £157,617,000 was owed by the central government and £14,289,000 by provincial governments.

**NAVY.** The Chinese navy includes: One protected cruiser, the *Hai Chai* (1898), 4300 tons, 24 knots; 3 protected cruisers, the *Hai Yung* (1897), *Hai Chen* (1897), and *Hai Sheu* (1898), each 3000 tons and 19.5 knots; 2 protected cruisers, the *Ying Swei* (1912) and *Chao Ho* (1912), each 2600 tons and 20 knots and especially adapted for the training of cadets; several sea-going gun vessels and various small craft, much of it antiquated and unserviceable. The Chinese dockyards are inadequate, and there are no naval bases of importance.

**GOVERNMENT.** The legislative authority is exercised by a parliament of two houses, the Senate (264 members) and the House of Representatives (596 members). The executive authority rests with a president, who is assisted by a cabinet of nine members. The premier is nominated by the president, other ministers by the premier, all appointments requiring ratification by the Parliament. President in 1917, Li Yuan-hung, till July 6, and after that Feng Kwo-chang.

#### HISTORY.

**THE BREAK WITH GERMANY.** After Germany resumed unrestricted submarine warfare China issued a protest on February 9 saying that if it was not regarded diplomatic relations would be broken off. After the United States broke off relations with Germany, China began to discuss a similar action and on March 14 handed the German ambassador his passports. China demanded of the Entente Allies and the United States the suspension of the Boxer indemnities which amounted to \$30,000,000 a year and would last until 1940, the consent of the powers to the increase of her import duties which under the treaty could not exceed 5 per cent ad valorem, and their consent to the posting of troops at Tientsin, on the Tientsin-Peking railway, and in the neighborhood of the legations. The Allies had already promised a part of these concessions. They were anxious that China should go into the war, not to take part in the fighting, but to supply a reserve of men. China had already contributed about 100,000 laborers and farm hands to the Entente man-power, for the most part in France, and it was the drowning of some of them on their way over on board

the *Athos* and other boats that led to the first protest against the German methods.

The rupture of relations with Germany was not carried out without some difficulty. In the first place, on March 4, when the cabinet had decided that China should follow the example of the United States, the president refused to approve this action; thereupon the prime minister, Tuan Chi-jui resigned, accompanied by several other members of the ministry. Parliament was nearly unanimous in support of the cabinet and the vice-president supported it also. The president, Li Yuan-hung, appealed to the article of the Constitution which declared that the provisional president with the consent of the national council should have power to declare war and conclude treaties. Soon afterwards, however, the president consented to the cabinet's having full power in the matter of foreign policy. The prime minister thereupon returned to office, and when the subject came up in the House on March 10 (the German reply which was received on that date, being unsatisfactory) the vote for breaking off relations was 431 to 87 and in the Senate, on the following day, 152 to 37. After the breaking off of relations China seized all the merchant ships in Shanghai, placing armed guards on the vessels. They found evidence of an intention to destroy them.

The question of declaring war against Germany now arose, and there was extended discussion of it in parliament. Finally the government appointed a special commission for international affairs to report on the subject. This decided in favor of China's entry into the war and the question was now to go before parliament. A secret session was held on May 9 and a resolution for declaring war was referred to a standing committee. The prime minister urged parliament to pass the measure. It was the subject of heated debate, for a considerable opposition had formed against it on the ground mainly that war ought not to be entered into until the cabinet had been reorganized and strengthened. After a stormy session the House of Representatives on May 11 refused to pass the resolution. A mob gathered around the parliament building and threatened violence until dispersed by the troops. On May 19 the House of Representatives, by a vote of 229 to 180, decided not to consider any war measure until after the resignation of the prime minister and the reorganization of the cabinet. A deadlock followed on the war question both in the House and in the Senate. Both in and out of parliament there was a strong demand for the resignation of the prime minister, who, it was feared, would take advantage of the war to violate the constitution and place the power in the hands of the Conservative Military party. On the other hand, the military governors throughout the country objected to his dismissal.

**IMPERIALIST REVOLT.** On May 29 it was announced that the military governors of several provinces had declared their independence of the central government. On May 31 it was learned that rebel forces had risen in Anhui and that General Chang Hsun was in control of the Tientsin-Pukow railway. The provinces reported to be in revolt were as follows: Sinkiang, or Eastern Turkestan; Fukien, in the south-eastern part of the county; Kiangai, to the

east of Sinkiang; Shensi, in central China; Honan, in central-eastern China; Anhui; Shantung; and Chekiang. On June 2 General Chang Hsun set up a provisional government at Tientsin and demanded the dismissal of Parliament, and the pardon of the monarchists who had been condemned. These conditions were accepted by the president of the republic on June 20. Ten days later Li-King-Li, in accord with General Chang Hsun, assumed the presidency of the council. The president of the republic, having refused to resign (July 3), was obliged to take refuge in the Japanese legation. Meanwhile, on July 1, the restoration of the Manchu dynasty was declared and the young emperor (Hsuan-Tung) was informed that he had succeeded to the throne. In Peking this passed off quietly. The edict announcing the restoration guaranteed a constitutional monarchy, non-interference of the dynasty in politics, recognition of foreign treaties and loans, and abolition of certain taxes imposed under the republic; forbade the establishment of political parties; and issued an amnesty to political offenders.

Soon after came the report that government forces were within a short distance from Peking and that the movement against the restoration of the Manchus was rapidly developing. On July 7 it was announced that the emperor had abdicated. By that time the Republicans appeared to be holding all the important military positions on the outskirts of the city. General Chang Hsun's troops, who were only slightly aided by the regular army, retired from Peking without fighting. At the same time it was announced that Chang Hsun had retired from all the offices held by him. General Feng Kwo-Cheng, who had been elected president on July 6, marched on Peking, surrounded the remaining insurgents and overthrew the new imperial government, July 8-12. General Chang Hsun took refuge in the Dutch legation.

The attempt to overthrow the republic and restore the Imperial government had utterly failed, but there was much disorganization among the republicans themselves who were taken by surprise by the counter-revolution and who found difficulty in reestablishing order. It was said that Germany had been behind this counter-revolution but this was not established. What seemed to be more certain was that the movement was not an isolated one but was connected with international affairs, especially with the relation between the United States and Japan and with the Russian revolution.

**WAR DECLARED AGAINST GERMANY.** The Chinese declaration of war against Germany which had been checked by the constitutional crisis and the attempt to restore the monarchy was unanimously decided by the cabinet and approved by the acting president on August 5.

**MISCELLANEOUS.** It was reported on January 10 that serious friction existed between China and Russia on account of the killing by Cossacks of seven hundred Chinese in the interior of the province of Sinkiang. Demands were presented by the Chinese government for an indemnity to the families of the victims and apologies and guarantees for the future. On January 16 it was announced that a compromise had been reached in the Tientsin concession dispute with France, providing for the restoration by the French to China of the territory in

question and on China's part an agreement to make the district an international region open to all the treaty powers. The news of the settlement of the dispute between China and Japan over the Cheng-Chiatun affair, noted in the preceding YEAR BOOK, was made public on February 21.

On January 5 the loan agreement which was placed in the United States for \$5,000,000 was announced. This was secured on the revenue from the government sale of wine and tobacco and was to be used for industrial development including national improvement and the increase of reserve and for specie payment of the Bank of China and the Bank of Communications. An announcement was also made on January 19 that Japanese banks had agreed with the Bank of Communications for a loan of \$5,000,000 in silver to be secured by bank notes and bonds. In March the loan for \$100,000,000 to the Chinese government for railway and other internal improvements which had been broken off several years before on account of President Wilson's withdrawal of government support from the American group was again under discussion and negotiations were reopened by syndicated banks representing the United States, Great Britain, France, Russia, and Japan. Further reports of loans were also circulated in March. According to figures published in the press the amount of German capital invested in Chinese enterprises was estimated at \$256,760,000. The number of German companies interested was said to be 244. The Germans had opened several mines in China. A considerable amount of railway mileage was in their hands and they had contracted to build other lines. On August 29 an agreement was signed by a group of Japanese financiers for the advance to China of 10,000,000 yen (about five million dollars) for general administration purposes. The advance was secured on the salt duties. In 1914 a group of banks, or *consortium*, representing British, French, Russian, Japanese, and German institutions, made a Reorganization Loan Agreement with China amounting to £25,000,000. The German institution dropped out as the result of China's declaration of war. Japan advanced the money above mentioned against the second Reorganization Loan which was to be associated with the *consortium*. The terms were more favorable than any China had recently received.

**CABINET CHANGE.** In the latter part of November the cabinet resigned and a new ministry was chosen under Wang Shih-cheng as acting prime minister. The crisis resulted from differences among the northern military leaders. Under the former prime minister the southern provinces had put an insurgent force into the field in Hunan and had defeated the government forces. Thereupon the prime minister had resigned. See WAR OF THE NATIONS, *Diplomacy of the War*.

**CHING, PRINCE.** A Chinese public official, died January 31, 1917, at Tientsin. He was born at Peking in 1839, and was adopted when a young boy by the Emperor Chien Lung, who gave him all the rights of royalty. Upon the death of the emperor, Kuang-sü, in 1908, he became a hereditary prince of the first order. For many years, supported by the Dowager Empress, whose favorite he was, Prince Ching held offices that were powerful partly because of

the amount of patronage connected with them. Appointed president of the Board of Foreign Affairs in 1884, he made many blunders of policy, some of which have been credited with helping to bring on the war with Japan. At that crisis, his predecessor, Prince Kung, was recalled to power. With Li Hung Chang he was associated in representing China in peace negotiations after the Boxer outbreak. He was afterward president of the ministry for two years and then of the grand council, and held other important posts of control over the army and navy till the abdication of the Manchus in 1912 forced his retirement from a long and corrupt career in public life.

**CHITTENDEN, HIRAM MARTIN.** An American soldier, died October 9, 1917, at Seattle, Wash. He was born in western New York in 1858 and graduated from the United States Military Academy in 1884. During the next fourteen years he was promoted through various grades to be lieutenant colonel of volunteers and chief engineer of the Fourth Army Corps. His contingent was held in readiness for the Spanish-American War in 1898, but was never called. He had directed large governmental engineering enterprises in Yellowstone National Park and on the Missouri, Ohio, and other western rivers. In 1910 he retired as brigadier general and in 1911 he was appointed commissioner of the port of Seattle, which position he resigned in 1915 on account of ill health. He published *Yellowstone National Park, Historical and Descriptive* (1895; 6th ed., 1913); *Reservoirs in the Arid Regions* (1897); *Forests and Reservoirs in Their Relation to Stream Flow* (1908); *War or Peace* (1911); *Report on the Water-Supply System of the Spring Valley Water Company* (1912).

**CHLORINATION.** See WATER WORKS AND WATER PURIFICATION.

**CHOATE, JOSEPH HODGES.** A distinguished American lawyer and diplomat, died in New York, May 14, 1917. He was born in Salem, Mass., January 24, 1832. His father was Dr. George Choate, a physician and member of the Massachusetts legislature (General Court), and his mother was Margaret Manning Hodges before her marriage. On both sides he came of distinguished old Colonial stock. The Choates, in particular, were marked by oratorical ability. It was a thrust at his own ancestors when Joseph H. Choate, become a brilliant after-dinner speaker, remarked that although the Pilgrim fathers had much to bear, the Pilgrim mothers had much more, for they had to bear with the Pilgrim fathers. The famous Rufus Choate was a cousin of Dr. George Choate, and the latter's son counted himself fortunate when as a young lawyer he could take to New York an introduction from his noted relative. This was in 1855. He had graduated from the Harvard Law School a year earlier, and in 1852 he had been fourth in the Harvard College class at the head of which stood his elder brother, William Gardner Choate, later also a lawyer. By 1856 Joseph H. Choate had entered the New York office of Butler, Evarts, and Southmayd, a firm which three years later became Evarts, Southmayd, and Choate, and in 1884 Evarts, Choate, and Beaman. These latter three men comprised perhaps the best known group of lawyers in the country, famous for their wit as well as for learning.

Mr. Choate rose to be a great trial lawyer. Possessed of a fine presence, eloquence second to none in his generation, humor that could become deadly irony, remarkable concentration, and a capacity for instant reaction to every significant development in a trial, he added to his physical and intellectual attributes a passion for justice, scorn of the forces of evil, and pity for the oppressed. The news that "Choate is going to speak" would pack a courtroom with admiring young and older lawyers. And it was amazing how often Choate did speak. With confidence that he would win out if any one could, men and corporations put into his hands and those of his partners many of the most notable cases of the time. Outside of criminal law, there was hardly a branch of which he did not make himself master—probate, patent, breach of promise, admiralty, military, corporation, constitutional, international, whatever the cases in hand called for. He handled the *Cruger, Vanderbilt, Tilden, Stewart, Hoyt, Drake, Hopkins-Searle, and Leland Stanford* will cases. In *Feu dardent v. di Cesnola* he successfully defended the genuineness of the Cypriote antiquities in the Metropolitan Museum, but only by making himself into a legal archaeologist. He defended the Standard Oil Company and the American Tobacco Company in the suits brought by the government, was attorney in the Chinese Exclusion, California Irrigation, and Massachusetts Fisheries cases, and before the Supreme Court of the United States argued the Texas Trust Law case and successfully attacked the constitutionality of the Income Tax Law of 1894. In 1879, before a special commission appointed by President Hayes, he had presented the cause of General Fitz-John Porter, who had been deprived of his rank in the army by court-martial on charges relating to his conduct at the second battle of Bull Run. Mr. Choate not only established Porter's claims but secured his reinstatement. In another sensational case, the suit against Russell Sage, Mr. Choate was counsel for "W. R. Laidlaw, a clerk injured, as he alleged, when Mr. Sage had used him as a screen to save himself from an assassin's tomb. The cross examination of Mr. Sage, afterward described by Choate himself as "skinning an intellectual eel," became famous in the profession.

Long before his death, Mr. Choate gained the distinction he coveted, and the only one he cared about, that of leading advocate of the American bar. He never sought public office, although as a protest against Republican machine politics in the State of New York he was a candidate for the United States Senatorial nomination in 1897 against Thomas C. Platt. The party caucus at Albany gave him just seven votes as against 142 for Platt. Earlier he had been in several anti-Tammany movements, and indeed was chief counsel of the "Committee of Seventy" which accomplished the downfall of Boss Tweed in 1871-72. In 1894 he served as president of the State Constitutional Convention. Long since his fame as an orator and after-dinner speaker had gone through the country. Numberless are the *bon mots* ascribed to him, but every genuine one is characterized by quietly spontaneous humor and easy felicity of phrase. Among his orations those on Lincoln, Farragut, and Rufus Choate are most familiar, and he himself considered the third of these the best.

Outside of the law and as an orator his reputation was hardly more than local until, when he was almost sixty-seven, he was sent by President McKinley to London as American Ambassador. Between 1899 and 1905, when he left England, he had gained the admiration and affection not only of British officialdom but of the British people as well. No other American diplomat had done more to bring to a closer understanding the United States and the country to which he was accredited. He became a prime favorite of Edward VII and charmed the society of the capital by his courtliness, wit, scholarship, and character. His orations on noted Americans, delivered in various parts of Great Britain, went far to reveal and interpret to his hearers the qualities of their cousins across the seas. Oxford, Cambridge, Edinburgh, Glasgow, and St. Andrews were proud to confer on him the honorary doctorate of laws, he was chosen foreign honorary fellow of the Royal Society of Literature, and was created a Bench-er of the Middle Temple, the highest honor that his legal brethren could bestow, and one never before received by an American. After his death memorial services were held for him at St. Margaret's, Westminster, and the Temple Church.

Although an old man when he returned to America Mr. Choate at once reentered active law practice, and active he remained to the day and fairly to the hour of his death, professionally and in the public interest, although latterly retired from the firm of Evarts, Choate, and Sherman, as it became. In 1907 he again represented the United States abroad, as first delegate to the International Peace Conference at The Hague, where his speeches did much to further the practical purposes of the conference. He claimed that the 80's made the best decade of all, and indeed they saw the climax of his life rather than its decline. Since the beginning of the European War he had ardently championed the cause of the Allies, and until the United States entered the war was a critic of the President and the administration. Undoubtedly his death was hastened by his untiring activity as chairman of the mayor's committee for the entertainment in New York of the French and British Commissions. Until their departure he had accompanied General Joffre, M. Viviani, his friend Mr. Balfour, and the other distinguished guests about the city, and had spoken on numerous occasions with a vigor, eloquence, wit, and patriotic fervor that amazed his hearers. Mr. Choate had been president of the American Bar Association, the State Charities Aid Association, the Pilgrims, and the New England Society of New York, honorary president of the National Security League, and vice-president of the American Society for the Judicial Settlement of International Disputes. He was the last survivor of the founders of the American Museum of Natural History. Honorary degrees were conferred on him by Amherst, Harvard, Yale, Williams, Pennsylvania, Union, Toronto, McGill, and Columbia. His orations were collected and published as *Abraham Lincoln and Other Addresses in England* (1910) and *American Addresses* (1911), and some of his briefs, memorials, and other papers have been printed. He left an estate of \$3,000,000, largely to his family. See *Life of Joseph H. Choate* by Theron G. Strong (New York, 1917).

**CHOLERA.** The curative value of replacing by various means (intravenous infusions, hypodermoclysis, enteroclysis, etc.), the tremendous loss of water which is a constant feature of this disease, was shown anew by Tushinsky, of Russia, who treated forty-four children under five years of age with intravenous infusions of salt solution (6.5:1,000), 400 to 2000 c.c. doses being given according to the age of the child. Thirty of the forty-four cases recovered. Of the thirteen fatal cases ten were in the algid stage when first seen. This is a high rate of recovery for young children, in whom the disease is particularly fatal.

**CHORAL SOCIETIES.** See MUSIC.

**CHOSEN.** See KOREA.

**CHRISTIAN, PRINCE, OF SCHLESWIG-HOLSTEIN.** A German prince, member of the royal family of Schleswig-Holstein, of which Duke Günther, only brother of the present German Empress, is the head, died October 28, 1917, in London. He was born in 1831 and in 1866 married Princess Helena, third daughter of Queen Victoria. Prince Albert of Schleswig-Holstein, eldest son of Prince Christian, is heir to Duke Günther, as the latter has no sons. Prince Albert at the outbreak of the European War in 1914 threw in his lot with Germany and became a Prussian officer.

**CHRISTIAN ENDEAVOR, UNITED SOCIETY OF.** In 1917 a large number of new societies were added to the world organization, making a total of over 78,039 according to incomplete returns. There are over 4,000,000 members belonging to eighty denominations. The international convention that was to have been held in New York City July 4-9, 1917, was indefinitely postponed, and no complete official report for that year was issued. The statistics for the United States and Canada, for the two years ending July 1, 1917, showed that in that time 8206 new societies were organized, and more than 718,435 new members were enrolled. The total number of Christian Endeavor societies actually enrolled in 1917 at Boston, the society's headquarters, was 78,039, and the number was believed to exceed this. Of this total, 52,402 societies were in the United States, 4094 in Canada, and 21,483 in foreign lands. Conservative estimates convinced the authorities of the society that if complete reports were available for the world, at least 10,000 new societies were organized and more than 1,200,000 new members were added during the two years ending July 1, 1917. The society had loyally adapted its programme to war needs, and a model constitution for army and navy Christian Endeavor societies was established. Publications of the society were distributed to soldiers. A special enlistment-pledge of Christian Endeavorers and their friends also was prepared. The officers in 1917 were: President, Rev. Dr. Francis E. Clark; William Shaw, general secretary; A. J. Shartle, treasurer and publication manager.

**CHRISTIANS.** This denomination had in 1917 approximately 115,000 communicants, 1450 churches and 1120 ministers. The administrative body of the church is the American Christian Convention, which is made up mostly of delegates from the conferences. The denomination maintains several schools and colleges, the most important of which are the Union Christian College in Indiana, Defiance College in Ohio,

Starkey Seminary in New York, Elon College and Franklinton Christian College (colored) in North Carolina, Palmer College and Weaubleau College in Missouri, and Jireh College in Wyoming. It has also a theological school, the Christian Biblical Institute, in Ohio. Missions are conducted in Japan, Porto Rico, continental United States and Canada.

**CHRISTIAN SCIENCE.** A year of great growth in the Christian Science movement was reported at the twenty-second annual business meeting of The First Church of Christ, Scientist, the Mother Church, held in Boston on June 4, 1917. The names of the officers for the ensuing year were read by Mr. McKenzie, the retiring president. They were as follows: President, William D. McCrackan, of Boston; treasurer, Adam H. Dickey, of Brookline; clerk, John V. Dittmore, of Boston.

The report of the treasurer showed that the Mary Baker Eddy memorial fund had been closed on February 24, 1917, with a total amount contributed of \$171,971.60. Of this sum \$161,171.36 had been expended in the erection of the memorial. Any money remaining from the fund is to be devoted to the maintenance fund. The total receipts of the War Relief Fund up to May 31, 1917, amounted to \$310,739.40. Of this amount \$264,474.74 has been forwarded to the committees of Christian Scientists entrusted with the distribution. The relief work done in countries where the Mother Church has no committees of Christian Scientists, such as Armenia, Belgium, Lithuania, Poland, and Serbia, was carried on through responsible and accredited organizations, through the United States consulates, and through the States Department at Washington.

The net increase in Christian Science organization during the year 1916-17 was 109, as compared with 65 during the preceding year. Included in this number are new churches and societies in Great Britain, Canada, Porto Rico, and Argentina. During the 12 months preceding the annual meeting 2287 Christian Science lectures had been given, with a total attendance estimated at about 1,600,000 persons. This attendance represented an increase of about 40,000 over the estimated attendance of the previous year. Tours were made by members of the board of lectureship to South Africa, Australia, New Zealand, the Philippines, China, Japan, Hawaii, and Alaska. A substantial gain was made during the year in the circulation of all of the Christian Science publications. It is interesting to note that in 1903 the Christian Science Publishing Company and the publishers of Mrs. Eddy's works employed about 20 people, while in 1917, the publishing house employed more than 600 people.

According to the statement made by the trustees under the will of Mary Eddy Baker, the trustees paid out in 1916-17, \$25,394.60 for lecture work. Thirteen thousand and four copies of the Christian Science textbook and other authorized books, and 2,574,175 Christian Science periodicals and other pieces of authorized literature were given to free lending libraries maintained by Christian Science churches, to public libraries, libraries of universities, colleges, normal schools, Federal and State prisons and reformatories, and to men in the armies and navies of the United States and foreign countries. During the period covered by the report the

trustees had given aid to 88 churches and societies for erecting, purchasing, and remodelling church edifices, which represent a total cost of \$1,328,610.86. Grants aggregating \$315,513.07 were made to these organizations by the trustees. The treasurer reported that contributions to the Christian Science Benevolent Association and the Real Estate Fund showed a very favorable activity. Among the objects of the above mentioned association is that of caring for some of the early students of Mrs. Eddy and for others who helped lay the foundations of the Christian Science movement and who now need provision for their peace and comfort.

**CHRISTMAS ISLAND.** An island in the Indian Ocean, about 200 miles south of western Java. Its only importance is due to its enormous deposits of phosphate of lime. The island is nine miles long, has an area of forty-three square miles, and is politically attached to Singapore. Population in December, 1915, about 700, all employed in phosphate exploitation. Phosphate export in 1913, 150,003 tons; in 1914, 93,780 tons; in 1915, 25,738 tons. The decrease in exportation is due entirely to war conditions, as sufficient ship tonnage has not been available. The island has a railway.

**CHURCH, JOHN ADAMS.** A prominent mining engineer died in New York City on February 12, 1917. He was born in Rochester and after graduating from the School of Mines in 1879, received the degree of Ph.D. from Columbia University. He was acting professor of mining and metallurgy at the school of mines in 1872-73, and for a time was editor of *The Engineering and Mining Journal*. Following this he joined the United States Geodetic Survey and made a survey of the famous Comstock lode. In 1886 Li Hing Chang, then viceroy of China, engaged Mr. Church to open the Mongolian silver mines and he spent four years in that country before returning to the United States to open offices as a consulting engineer.

**CHURCH, WILLIAM CONANT.** An American editor, died in New York City, May 23, 1917. He was born in 1836 in Rochester, N. Y., and came of old colonial stock. With his family he went in 1848 to Boston, where he studied at the Boston Latin School, and in 1854 to New York, where his father became publisher of the *Chronicle*. William C. Church succeeded to this responsibility when he was only twenty-four years old and the same year became publisher also of the *New York Sun*. Within the year, however, he went abroad, returning just in time to take part in the joint military-naval expedition under General Sherman and Admiral Dupont, and helped take Port Royal (1861). While volunteer aid on the staff of General Silas Casey, he participated in the battles of Williamsburg, where he was wounded, and at Fair Oaks. Later he was made captain and brevetted major and lieutenant colonel of volunteers. As the outgrowth of a project to establish a military paper, the *Army and Navy Journal* was founded by Col. Church and his brother, Francis P. Church, in 1863, and it continued under the former's editorship till his death. For ten years, before it was merged with the *Atlantic Monthly*, in 1879, the brothers published the *Galaxy*, a new magazine that numbered Henry James, Charles Reade, and Mark Twain among its contributors. Colonel Church was a founder and the first president of the National Rifle

Association. He wrote, besides many articles, lives of John Ericsson and Ulysses S. Grant.

**CHURCH OF THE NEW JERUSALEM.**

This denomination in 1917 had about 10,200 communicants, 155 churches, and 150 ministers. It rejects the commonly received notion of the Trinity, and acknowledges the Lord Jesus Christ as the One God. Emmanuel Swedenborg is the true revealer of the meaning of the Scriptures, according to the teachings of this denomination. The General Convention exercises a supervision over the Church. The *New-Church Messenger* is the official journal. The publishing house is at 3 West 29th Street, New York City. It publishes Swedenborg's works.

**CINCINNATI UNIVERSITY OF.** A co-educational institution of learning, one of the few municipal universities in the United States, located at Cincinnati, O. In the fall of 1917 there were 2922 students. Volumes in the library numbered 88,100. The University was founded in 1871. President, Charles William Dabney, Ph.D., LL.D.

**CITRELLA.** This is a hydrated acid magnesium salt of citric acid, having the chemical formula  $MgH_2C_6H_5O_5 \cdot 5H_2O$ . It has the same laxative and purgative action as magnesium citrate and occurs as a white or faintly yellowish-white, crystalline, odorless powder having an acid taste. It is soluble in water, but insoluble in alcohol, ether or chloroform.

**CITY MANAGER.** See **MUNICIPAL GOVERNMENT.**

**CITY PLANNING.** Recognition of the fact that city planning should find a place in the legalized framework of city government is increasing. When attention was first given to city planning in the United States it was extra official. Studies and reports were made by or for civic organizations. As a rule, there the matter stopped. A later step was the employment by the city of a specialist in city planning to make a local survey and draw up a general scheme of action. This was good as far as it went but responsibility for carrying out the plan was placed on no one and seldom was it assumed by the governing body. Parallel with this was the creation of city planning commissions. Rarely were these a component part of the city government. They could advise but could not enforce city planning activities. Such were and still are the city planning commissions required by statute in every city, and also in every town of 10,000 population, in Massachusetts, and made permissible in some

other parts of the country. In a few instances, city planning duties have been vested in a commission composed jointly of city officials and of citizen members. The question arises, should officials or citizen members be in the majority on such a commission? Also, should the official members be selected from the executive or the legislative branch of the government? The answer to both questions depends largely upon the powers of the commission. If the commission has power to adopt a plan then there is strong argument for a majority membership of city officials, and that, too, from the legislative arm of the government. The more purely advisory the commission may be the less does it matter if the membership be mostly unofficial. But if it is to do much real planning, for actual execution, the executive branch of the government should have effective representation, through the responsible head of municipal engineering work.

**CINCINNATI CITY PLANNING COMMISSION.** The new mayor-and-council city charter for Cincinnati, Ohio, adopted November 6, 1917, to go into effect January 1, 1918 (see **MUNICIPAL GOVERNMENT**) provided for a city planning commission of seven members, five of whom shall be the mayor, director of public service and the three park commissioners and two shall be citizens. The commission is given broad powers. Its duty is to make plans of the whole or any part of the city and of any land outside the city which it thinks bears a relation to the planning of the city. These plans are to include the commission's recommendations for new streets, bridges, subways, parks, and playgrounds. They may also include recommendations for zoning and for limiting the height, bulk and use of buildings in the various zones. Whenever the commission shall have made a plan for any part of the city no public improvement or public utility shall be built or authorized to be built within the area covered by the plan without the approval of the commission, nor shall any street be opened in any part of the city without such approval, provided that the city council, by a vote of not less than two-thirds of its members, may overrule any such failure to approve. The commission may make recommendations to the proper city authority or to any corporation or individual concerning the location of streets, public buildings or works, public transportation or other utilities to be erected in the city or contiguous territory. All plots for laying out land in the city or within three miles of it must be submitted to and approved by the commission as a condition precedent to the dedication of streets or commons.

**ROCHESTER, N. Y., SUPERINTENDENT AND ADVISORY BOARD.** A quite different method of handling city planning was authorized by statute for Rochester, N. Y., during the year. Provision is made for a bureau of city planning in the engineering department of the city, headed by a superintendent appointed by the city engineer and holding office during his pleasure. There is also an advisory board, consisting of the corporation council, ex-officio, and four members appointed by the mayor. The city planning superintendent has power to make a city plan; to pass on all plotting for the opening, widening or extension of streets; and to establish building zones and restrict buildings to conform thereto. In the preparation of a city

plan the superintendent must obtain the services of competent consultants. All actions of the superintendent are subject to approval by the advisory board and such joint action is subject to review by the mayor. The mayor may hold public hearings on the advice of the superintendent or of the advisory board or on his own initiative, and has power of absolute veto after such hearings have been held. It may be added that under the city charter of Rochester the mayor appoints the city engineer and in general is the chief executive officer. The city engineer is a member of the boards of estimate and of contract awards, as is also the mayor. It would therefore appear that the city council of Rochester has little control of city planning.

ST. LOUIS. As an illustration of what needed to be done in many cities and might be done by a city planning commission, the improved major-street plan proposed in 1917 by the City Plan Commission of St. Louis, Mo., may be considered. The commission found that about 75 per cent of the streets of the city were sixty feet wide, which was insufficient for heavy through traffic and unnecessarily wide for minor residence streets. Less than 15 per cent of the total street mileage was over sixty feet wide. Moreover, the streets were laid out haphazard—which unfortunately is not peculiar to St. Louis—so as to afford but few continuous thoroughfares and hardly a radial street. It was found that most of the widenings and extensions needed to provide an adequate major-street plan would fall in outlying districts, where the changes could be effected without great physical difficulty or expense. As an aid to deciding what widenings and extensions were needed a traffic census was made. Maps were then drawn which showed by the relative widths of the street lines the comparative numbers of horse-drawn vehicles, passenger automobiles, and motor trucks passing over the principal streets of the city. There was a separate map for each class of traffic and a fourth map showing the combined traffic. These maps made evident, both by the width of the lines and the gaps where no streets existed and by the rectangular network of streets, just where the street system needed reinforcement to accommodate the traffic in both weight and direction. A fifth map was then readily drawn to indicate needed street widenings, extensions, and cutoffs. A report detailing the whole study by means of text, maps, and tables was published in 1917 by the City Plan Commission of St. Louis. An article based on the report, prepared by Harold Bartholomew, engineer of the commission, appeared in *Engineering News-Record*, July 19, 1917. Mr. Bartholomew thus summarizes the advantages of a major street plan:

"1. It simplifies future work. Whenever an extensive street extension or widening becomes necessary, it can be made in accordance with a well-defined generally accepted plan.

"2. It will be a means of great economy in the transit and transportation problems. As improvements in the major-street plan are made, certain rerouting of the transit lines can be made, which will reduce the time and the cost of operation. St. Louis is the largest city in the country having surface transit only. It is not yet in a position to construct rapid-transit lines. By carefully executing the major-street plan, good service can be provided without the necessity of heavy expenditures for rapid-transit lines within the next few years. When rapid-transit lines are needed, it will be possible to

construct them to better advantage and greatly reduce the cost.

"3. It encourages much more economic city maintenance. The major streets will gradually develop as the principal channels of travel. They will consequently reduce the miscellaneous movement of traffic on minor streets. On these minor streets, then, considerable expense can be avoided by reducing the width of the roadway and by laying, in many instances, pavements of considerably less cost. On 17.4 miles of streets to be improved in 1917, the standards for major-traffic streets will be adopted, while the roadways of minor streets, where possible, are being reduced from 36 to 26 ft. in width and less expensive paving laid. The remaining width of 10 ft. is being devoted to grass or shrubs. To discourage traffic on minor streets means greater privacy and hence greater stability of values and development."

PLANNING CONFERENCES. Early in the year a metropolitan district conference on city and town planning was held in New York City. The importance of coordinating the planning efforts of Long Island and of Westchester County on the east and north and of five counties of northeastern New Jersey on the west and south was urged. Stress was laid upon the need for better transportation service between districts lying on opposite sides of New York City. Later in the year the City Planning Conference was held at Kansas City, Mo., where it was decided to change the temporary form of organization which has provided for a half dozen years. Accordingly, the City Planning Institute was formed, with provision for several grades of membership (Flavell Shurtleff, secretary, 19 Congress St., Boston, Mass.).

WAR-TIME CITY PLANNING. Rarely have opportunities for comprehensive town planning been presented and never have they been more fully utilized than in connection with the national army cantonments of the United States. Sixteen cities of 30,000 inhabitants were planned, built, and occupied within a period of a few months on sites which at the outset were cornfields, forests, or open country. The fact that the buildings were of wood and only one or two stories in height was more than offset by the speed with which they were provided, the enormous volumes of building material required, and the completeness of the utility services. In the planning of these cantonments the landscape architect and the engineer worked hand in hand and the entire camps and all their utilities were laid out and built as one comprehensive whole—two conditions which rarely prevail. In similar but not always so efficient manner many other military camps were provided during the year. Much attention was also given to urban areas for housing the suddenly massed industrial population at munition and shipbuilding plants. Industrial housing generally has been given marked attention of late and with it has gone considerable town and city planning. Rural planning was also coming to the front both in the United States and Canada. In the latter country the Conservation Commission had for several years had an expert British town planner on its staff, who recently brought out a large volume on rural planning. The replanning of the devastated cities of Europe was under consideration for the past two or three years and would demand increasing attention in the early future. The slowing down of municipal construction in 1917 will afford engineers and others an opportunity to plan for future city needs which should not be neglected. Such planning required no capital outlay, no materials or labor, and

might be made to contribute to the comfort, happiness, and health of city dwellers, besides saving immense sums which, without wise planning, would be misspent.

**BIBLIOGRAPHY:** Post (editor), *City Planning Progress in the United States* (Washington, D. C.), reviews city planning efforts up to 1917 in 233 municipalities; Yeoman, *City Residential Land Development* (Chicago); Burnap, *Parks, Their Design, Equipment, and Use* (Philadelphia); Adams, *Rural Planning and Development* (Ottawa, Canada). See ARCHITECTURE.

**CIVIC FEDERATION, NATIONAL.** See NATIONAL FEDERATION.

**CIVIL SERVICE REFORM LEAGUE, NATIONAL.** The war brought problems of civil personnel to the Federal Government which drew the early attention of the league. A few months before the United States entered the war the league had greatly increased its annual budget and was accordingly able to employ experts to study these problems and make recommendations for their solution, some of the recommendations being later adopted by the Federal government.

During the year the league heartily approved of the executive order of the president that further vacancies in the office of first, second, and third class postmasters be filled henceforth by examination instead of by political selection. For the purpose of conducting its propaganda to extend the scope of the civil service law, and also to draw a clear line of distinction between administrative and policy determining functions, a Washington office was opened in addition to the central office of the league in New York. Other practical services to the government included direct aid in the recruiting of applicants for civil service and the simplification of the examination methods. The officers of the league in 1917 were: President, Richard Henry Dana; secretary, George T. Keyes; treasurer, A. S. Frisell.

**CLARK, WILLIAM BULLOCK.** An American geologist, died July 27, 1917, at North Haven, Me. He was born at Brattleboro, Vt., December 15, 1860, was educated at Amherst College, and studied geology at Munich. He was appointed instructor in geology at Johns Hopkins University in 1887, and in 1888 joined the United States Geological Survey. He was associate professor of geology at Johns Hopkins, 1892-94; professor and director of the Geological Laboratory from 1894 until his death. In 1891 he was appointed director of the Maryland Weather Service, in 1896 State geologist of Maryland, in 1900 Commissioner for the State of Maryland on the resurvey of Mason and Dixon's line, and in 1908 a member of the Maryland State Conservation Commission. His publications include interesting papers and reports dealing with American geological topics. They were written chiefly for the volumes of the *Maryland Geological Survey*.

**CLARK UNIVERSITY.** A non-sectarian institution for graduate study only at Worcester, Mass. In the fall of 1917 there were 69 students and 27 members of the faculty. Volumes in the library numbered 83,000. Productive funds in 1917 amounted to \$2,400,000 and the income was \$103,875. Clark University was founded in 1889. President, G. Stanley Hall, Ph.D., LL.D.

**CLEMENTS, JUDSON CLAUDIUS.** An American politician and commerce expert, died June 18, 1917, at Washington, D. C. He was born in Walker Co., Ga., February 12, 1846, studied law, was admitted to the bar in 1869, and practiced at LaFayette, Ga., in 1869-92. He was county school commissioner in 1871, a member of the Georgia House of Representatives in 1872-76, and a member of the State Senate in 1877. From 1881 to 1891 he was a member of Congress, was a member of the Interstate Commerce Commission in 1892-1912, and was reappointed to the Commission in 1913. In 1911 he published *Moral Results of Modern Transportation and Transmission Facilities*.

**CLIMATE.** See METEOROLOGY.

**CLOSSON, HENRY WHITNEY.** A veteran of the old frontier battles and the Civil War, died July 16, 1917, at the age of eighty-five. He was graduated from the United States Military Academy in 1850. He participated in many explorations and Indian campaigns, including the expeditions against the Seminoles in 1857. At the outbreak of the Civil War he was a captain of artillery. He was brevetted lieutenant colonel for his services at the siege of Fort Morgan, and advanced to rank of brigadier general, retired, in 1904. He served on the Board of Ordnance and Fortifications for several years before his retirement in 1896.

**COAL.** The production of coal in the United States in 1916 was 590,098,175 net tons, valued at \$867,125,638, an increase compared with 1915 of 58,478,688 tons, or 11 per cent, in quantity, and \$180,434,452, or 26 per cent, in value. The production of bituminous coal was 502,519,682 tons, valued at \$665,116,077, an increase of 13.5 per cent in quantity, and 32.5 per cent in value. The production of Pennsylvania anthracite was 87,578,493 net tons, valued at \$202,069,561, a decrease of nearly 2 per cent in quantity, but an increase of more than 9 per cent in value.

All the principal coal-producing States showed increases in output. The most notable increase was in Ohio, whose production of coal in 1916 was 12,293,528 tons, or nearly 55 per cent greater than in 1915. The increase in the value of the Ohio product was nearly \$22,000,000, or about 91 per cent. The largest increase in quantity was in Pennsylvania—12,340,287 tons, or 7.8 per cent compared with 1915. The increase in West Virginia was 9,276,058 tons, or 12 per cent; in Illinois, 7,365,760 tons, or 12.5 per cent; and in Indiana, 3,087,376 tons, or 18 per cent. Iowa, New Mexico, Oklahoma, South Dakota, and Texas recorded slight decreases in 1916 compared with 1915. The output of bituminous coal in 1916 established a new record in the United States as a whole and also in most of the individual States.

The average value of anthracite was \$2.30 a

net ton, compared with \$2.07 in 1914 and 1915. The average value at the mines, of the bituminous coal produced in 1916, was \$1.32 a ton, compared with \$1.13 in 1915 and \$1.17 in 1914. Both of these figures are higher than those recorded in any other year from 1880 to 1916, a period for which comparable figures are available.

The number of men employed in the production of bituminous coal in 1916 was 561,102, an increase of 3646 compared with 1915. The number of men employed in the production of anthracite coal decreased from 176,552 in 1915 to 159,869 in 1916.

The anthracite mined in 1916 amounted to 78,195,083 gross tons, valued at \$202,009,561, a decrease in quantity of 1.6 per cent, and an

logical Survey estimated the output of bituminous coal for the year as 544,142,000 short tons, or 8.3 per cent more than the 1916 output. The preliminary estimate for anthracite was between 90,000,000 and 100,000,000 short tons. The coal situation in the United States was serious during the year. Constantly there were coal shortages and, at various times, shortages when not actually occurring were threatened. Transportation facilities were bad throughout the entire year, and in the opening months, the stocks of anthracite were at the lowest point since 1902. With a coal shortage in the northwest, traffic was opened on April 16 on the Great Lakes, earlier than usual. There was a steady demand in the spring to buy coal for winter use, but the Federal Trade Commission ordered that the

Production of coal in the United States in 1915 and 1916, United States Geological Survey

State	1915		1916

a No coal was produced in Nevada in 1916.

increase in value of 9.4 per cent compared with 1915. The shipments decreased 1.7 per cent—from 68,666,456 gross tons in 1915 to 67,501,363 tons in 1916. The shipments of prepared coal of the sizes above pea in 1916 were 40,747,215 tons, a decrease of 1.1 per cent; the shipments of pea size were 7,520,804 tons, a decrease of 8.4 per cent; and the shipments of steam sizes smaller than pea were 19,233,344 tons, a decrease of but .05 per cent compared with 1915.

The production in the Lehigh region was 10,929,055 gross tons; in the Schuylkill region, 23,659,448 tons; in the Wyoming region, 43,111,732 tons; and in the Sullivan County (Bernice Basin), 494,848 tons.

There was a large decrease in the number of men employed in the production of anthracite in 1916, and the output was maintained only through an increase in the number of working days. The number of men employed in 1915 was 176,552, and in 1916, 159,869.

At the end of 1917, the United States Geo-

usual reduction in price for April should be maintained.

With the entrance of the United States into the war, the question of fuel supply for the various industrial plants, as well as for export and domestic consumption, became a vital one. A coal committee of the National Defense Council consisting of Secretary Lane of the Department of the Interior, Chairman Peabody of the Coal Production Committee of the Council, and ex-Governor Fort of the Federal Trade Commission was in conference with a number of coal producers and on June 28 fixed a coal price which was a reduction of about one-third from the price then prevailing. The prices figuring in this agreement were substantially \$3.00 a ton with a 50-cent reduction for all coal sold to the government. This agreement was repudiated by Secretary of War Baker as chairman of the National Council of Defense on June 28, Secretary Baker accusing the coal men of setting an exorbitant and excessive price. On the other hand, it was argued that Secretary Lane, who

represented the government on the Conference Committee, was advised by experts of the Geological Survey familiar with the production and marketing of coal, and in behalf of the industry it was stated that the price settled on was a fair one. It was suggested, however, that inasmuch as a prosecution of coal men on a charge of price fixing was then taking place in New York that the Attorney-General dreaded the effect that such an agreement would have upon the trial. The repudiation of the agreed price added further uncertainties to the situation, though during mid-July all records were broken for shipment of anthracite.

On August 21, President Wilson, after an investigation by W. B. Colver, Federal Trade Commissioner, fixed the base price for bituminous coal at approximately \$2.00 per short ton at the mines instead of the \$3.00 base price as asked for by the government. The price of anthracite was also fixed at \$4.00 to \$5.36 per short ton according to locality and size. It was urged that this price fixing was forced upon the president because of the threats of various governors in the Middle West to fix such prices if the Federal Government did not act, but these prices were found inadequate, and on October 29, the president permitted an increase of 45 cents per ton in the price of bituminous coal in practically all mines in the country, and on December 1, there was an increase in the price of anthracite of 35 cents per ton to meet the proposed wage increase for anthracite miners.

On August 24, Dr. Harry A. Garfield (q.v.) was appointed Fuel Administrator, and the government attempted to cope with the situation with rather a lack of success in view of the extraordinary conditions that developed later in the year. (See FOOD CONTROL.) A number of small mines were closed because they could not work at the price allowed during the period of uncertainty, and the Fuel Administrator refused to sanction the opening of new mines on the ground that such undertakings might not be productive and might be a waste of effort. Furthermore, the Fuel Administrator did not adopt a plan for a zoning system when first it was proposed by producers and railways. Various other suggestions were made to the Fuel Administrator by different persons in the industry, but few of these had been worked out satisfactorily by the end of the year.

The fuel administration and many of the miners blamed the railways for lack of transportation, and this indeed was a serious difficulty. From the latter part of July, transportation facilities were overtaxed and by December, when heavy snow and intense cold prevailed, a demoralization took place resulting in practically a coal famine in various sections of the country, particularly in the Middle West and East.

Wages were raised during the year both in bituminous and anthracite fields, and every effort was made to increase the production. Thus, at the end of December after the slump in the middle of the month, bituminous coal averaging 1,793,000,000 short tons per working day was being mined during Christmas week.

At the end of the year, there was a shortage of practically 1,000,000 carloads, though the average daily production of coal was estimated at 1,402,594 tons, which was the lowest mark reached since the week of August 18 at the time of the coal strike in Illinois and the South

Appalachians, when but 1,638,513 tons were produced.

**COAL SITUATION IN EUROPE.** However serious the coal situation was in the United States, even worse conditions prevailed throughout the world, particularly among the belligerent nations. In 1913, the lowest normal year for war production, the coal output of the world was 1,478,000,000 tons, distributed somewhat as follows: United States, 570,000,000 short tons; Great Britain, 322,000,000 short tons; Germany, 306,000,000 short tons; Austria-Hungary, 60,000,000 short tons; France, 45,000,000 short tons; Russia, 36,000,000 short tons; Belgium, 25,000,000 short tons; and Japan, 24,000,000 short tons.

In this year the production of the United States was approximately 38 per cent and by 1916 it had risen to 44 per cent and in 1917 it was estimated at 45 per cent or over. Fuel production had grown from 270,000,000 short tons in 1900 to almost 650,000,000 short tons in 1917. Since the beginning of the war, the coal exports of the United States had exhibited a slight increase, amounting to about 20 per cent more in 1917 than in 1913, while those of Great Britain had declined and those of Germany were confined to the adjacent neutral countries figuring in exchange for various needed commodities. In the fiscal year, 1917, of the coal exported from the United States, about 68 per cent went to Canada, 6 per cent to Cuba, 8 per cent to South America, and less than half of one per cent went to Italy.

In Great Britain, on November 14, the Board of Trade announced that it would take over the coal mines for the period of the war, establishing a new department of control under the direction of Guy Calthrop, general manager of the Northwestern Railway, as Coal Controller, with Sir Richard Redmayne, Chief Inspector of Mines, and an advisory committee of owners and miners to assist him. Matters connected with the distribution, wages, production, and the price of coal later were concentrated in the new Mines Central Department and the Government Committee for the State Control of the Welsh field was dissolved. An early step of the Controller was to relieve the pressure on the British railways by providing for increased transport of coal by canal, and in July, he announced that he expected to save no less than 700,000,000 ton-miles annually in the transport of coal by railway by dividing Great Britain into twenty areas so as to economize and facilitate distribution. This plan came into effect in September and dealt with the coal for inland consumption.

It provided that first, consumption of coal should take place as near the producing place as possible; second, that the movement of traffic should follow the main traffic lines as much as possible; third, that such movement should be as far as possible in well-defined directions; fourth, that an area producing less coal than that required for its own needs should not ship out of such a district, while an area providing more coal than it consumes should receive no supply from other areas. While some dislocation of business prevailed for a time, yet matters were soon settled though the actual net results obtained were not deemed by all to be as great as anticipated by the Controller. Another plan developed was to secure increased mobility of mining labor so as to utilize the

surplus of labor of some districts in others where there was a deficiency. A demand for increase of wages for the miners led to an increase of 2s. 6d. per ton being added to the price of coal, and a Coal Mines Control Agreement (Confirmative) Bill was passed with various objections on the part of the operatives.

At the end of September at the new colliery at Keresley, Northeast Warwickshire, four valuable coal seams were laid bare, having an aggregate thickness of just over 23 ft. at a depth of 711 yards. This colliery was to be the largest in the country, giving employment ultimately to 4000 men. In the first nine months of 1917, the coal output was 187,750,000 tons, or 5,000,000 less than in the corresponding period of 1916, due to the demands that had been made by the military on the colliery districts for recruits.

**COAST AND GEODETIC SURVEY, UNITED STATES.** In an executive order dated September 24, 1917, President Wilson directed that in view of a national emergency existing certain vessels, including their equipment and personnel, and also many engineers in the commissioned personnel of the Coast and Geodetic Survey, should be transferred to the Navy Department. In addition, many men who at the time were part of the commission personnel of the survey were transferred and commissioned in the Officers' Reserve Corps. See **TERRESTRIAL MAGNETISM**.

**COAST DEFENSES.** See **MILITARY PROGRESS**.

**COASTLAND**, or in German, K'STENLAND. An administrative district of Austria at the head of the Adriatic Sea, consisting of the crownlands of Istria, Görz and Gradisca, and Trieste (qq.v.). Area, 3077 square miles. Population December 31, 1910, 893,797; as estimated in 1913, 938,008. The principal cities are the great Austrian seaport Trieste, which with its territory had an estimated population of 246,500 in 1914; Pola, the important Austrian naval base, 59,300; Görz (Goritz, Gorizia), 32,600.

**COCHIN-CHINA.** A French colony, the southernmost division of French Indo-China (q.v.). Saigon is the capital, with about 68,000 inhabitants; Cholon has about 182,000. River and coast fishing, stock raising, and agriculture are carried on.

**CODY, WILLIAM F. ("Buffalo Bill").** An American scout and showman, died in Denver, Colo., January 10, 1917. Born in Scott County, Iowa, February 26, 1846. He went with his family to Missouri and later to Kansas, where they were among the first settlers. His father, who was elected to the Territorial Legislature, was killed in the Kansas Border War when the son was only 14, and young Cody was left with his mother and two sisters to support. First he became a government freighter between Salt Lake City and the Missouri River. Later, when the "pony express" from St. Joseph, Mo., to San Francisco was established, he entered the service as a rider. During the Civil War, from 1861 to 1865, he was a government scout and guide with the 7th Kansas Cavalry, serving under Gens. Blunt, McNeil, and A. J. Smith. After the war he opened the Golden Rule Hotel at Leavenworth, Kans., but he could not long tolerate anything as quiet as hotelkeeping. By 1867 Cody, who had already made a name as a

hunter, contracted to furnish the Kansas Pacific Railway with all the buffalo meat required to feed its army of construction laborers. Within eighteen months he killed 4280 buffaloes, thereby earning the name by which he was afterward best known, "Buffalo Bill." From 1868 to 1872 he was again a government scout and guide in the expeditions against the Sioux and Cheyennes. Gen. Phil Sheridan and other noted soldiers of the time found his services invaluable. For a year (1872) he was a member of the Nebraska Legislature, but he also found time to take the Grand Duke Alexis of Russia on a buffalo hunt. Besides a party of well-known New Yorkers. These men, among whom was James Gordon Bennett, shortly afterward entertained Cody in New York. There he was said to have seen a play called *Buffalo Bill, King of Bordermen*, the success of which induced him to go on the stage himself. For some time he appeared in plays depicting life on the frontier. In 1874, however, he was again a scout, as guide of the Big Horn expedition. While he was chief of scouts under Gen. Crook, in 1876, Yellow Hand, the Sioux chieftain, challenged him, "Long Hair," to single combat. Cody lived to be famous for the exploit, and the Indian did not. During another Sioux outbreak, in 1890-91, he headed the Nebraska National Guard and fought the battle of Wounded Knee.

In 1883, Cody organized the "Wild West" show and from that time devoted most of his attention to an enterprise that made him known on two continents, and which continued to be successful till a few years before his death. Latterly the show had become known as "A Congress of the Rough Riders of the World." It appeared yearly in most of the cities of the United States, and made a sensation abroad. At the first performance in England 40,000 persons were present. Among his patrons Cody counted many of the crowned heads of Europe and other distinguished persons. Later the show got into financial difficulties and at last went into the hands of a receiver, "Buffalo Bill" saving just enough out of the collapse to keep his Wyoming ranch in Big Horn County. After his death Cody's body lay in state in the capitol at Denver, and is eventually to be placed in a tomb hewn from the rock at the top of Lookout Mountain, near Denver, with a monumental figure to mark the spot.

**COHAN, JERE JOHN.** One of the originators of vaudeville in America and one of the most popular of American comedians of all time. He was sixty-nine years old when he died on August 1, 1917. He served as a drummer boy during the Civil War, and shortly after its close entered upon his career on the stage. He made his last appearance on the stage about nine years ago when he toured the country with *The Yankee Prince*, a production of his son's, George M. Cohan. In 1915 he played for a week in the *Friars' Frolic*. Most of the sketches and the plays which he appeared in were written by his son.

**COINS, VALUE OF FOREIGN.** The table of coins, on the following page, gives the value of foreign coinage in the currency of the United States.

**COIT, HENRY LEBER.** A specialist in children's diseases, died in Newark, N. J., on March 13, 1917. He was sixty-two years old and was the founder of the Newark Babies' Hospital,

the first institution of its kind in the United States. He was also a promoter of the movement for certified milk. He was graduated from the College of Pharmacy in New York City in 1876 and from the College of Physicians and Surgeons in 1883. He was a member of the International Society Goutte de Lait, with headquarters in Budapest. He was also a member and the first president of the American Association of Medical Milk Commissions. In 1911 he represented the New Jersey medical societies at the International Congress for the Protection of Infants, held in Berlin.

**COKE.** The production of coke in 1916 was 54,533,585 net tons, valued at \$170,841,197, an increase compared with 1915 of 12,952,435 tons, or 31 per cent, in quantity, and \$65,337,329, or 62 per cent in value. The output of beehive coke was 35,464,244 tons, having a reported value of \$95,468,127, an increase of nearly 29 per cent in quantity and 67 per cent in value, compared with 1915. The production of by-product coke was 19,069,361 tons, valued at \$75,373,070, an increase of 35.5 per cent in quantity and 55.2 per cent in value, compared with the previous year. By-product coke represented nearly 35 per cent of the total in 1916, compared with 34 per cent in 1915. The average number of beehive ovens in operation in 1916 was 65,605, compared with 48,985 in 1915, an increase of 16,620 ovens. The number of active by-product ovens increased from 6036 in 1915 to 6607 in 1916. Six new by-product coke plants with an aggregate of 60 ovens, began operations in 1916, and had an aggregate output of 708,485 tons of coke. Every important producing State shared in the increase.

During 1917 the by-product coke industry in the United States made remarkable progress. On December 31, 1917, there were 54 by-product coke plants containing 7495 ovens with an annual capacity for handling 35,625,000 tons of coal and producing 26,005,400 tons of coke, 89,658 tons of ammonia, and 11,464,000 gallons of toluol. There were under contract for operation in 1918, 1844 ovens having a carbonizing capacity of approximately 10,000,000 tons of coal per annum and a coke-making capacity of approximately 7,000,000 tons per annum. If operated at capacity these additional plants would afford approximately 3,500,000 gal. of toluol and 25,000 tons of ammonia (100 per cent  $\text{NH}_3$ ). This industry supplied coke for the blast furnace, gas for the open hearth and heating furnace, benzol and toluol for high explosives, creosote for timber, ammonia for fertilizer and as a refrigerant for food, dyes for fabrics, cyanide for mines, and drugs for physicians. During the year the Carnegie Steel Company constructed 640 Koppers by-product ovens which were to be put into operation early in 1918, and would have a capacity of 4,100,000 net tons of coal. The coke and by-products would be for use at the company's plants at Clairton, Duquesne, Edgar Thomson, and Homestead.

**COLBY, GARDNER.** An American civil service officer, died November 4, 1917, at East Orange, N. J. He was born at East Orange, N. J., September 12, 1864, graduated at Brown University in 1887, entered business life and in 1893-1901 was president and treasurer of the Everett Pulp and Paper Company and treasurer of the Everett Land Company. He was treasurer of the Kinsman Block Signal Company in 1906-08.

In May of the latter year he was appointed secretary and chief examiner of the New Jersey Civil Service Commission. Colby managed the first independent campaign of the original Progressive party.

**COLGATE UNIVERSITY.** A non-sectarian institution of learning including two departments—college and theological seminary—at Hamilton, N. Y. There were in the fall of 1917 in both departments 464 students and 50 members of the faculty. Volumes in the library numbered 80,000. Productive funds in 1917 amounted to \$2,125,000 and income to \$93,629. Colgate was founded in 1819. President, Elmer Burritt Bryan, LL.D., L.H.D.

**COLLEGES.** See UNIVERSITIES AND COLLEGES.

**COLLEGES, AGRICULTURAL.** See AGRICULTURAL EDUCATION.

**COLLISIONS.** See RAILWAY ACCIDENTS.

**COLOMBIA.** A northwestern republic of South America. Capital, Bogotá.

**AREA AND POPULATION.** On account of unsettled boundaries, estimates of area differ considerably. Tentatively the area may be stated at about 435,000 square miles, which is a little larger than the States of Nevada, Utah, Arizona, and New Mexico combined. The census of March 5, 1912 (which contains some estimates), returned a population of 5,072,604. Population of the larger cities and towns, according to the 1912 census (the figures relate to *municipios*, which usually comprise rather extended areas): Bogotá, the capital, 121,257; Medellín, a mining centre, 71,004; Barranquilla, head of the Magdalena River steamer service, a commercial town connected by 17 miles of railway with the Caribbean coast at Sabanilla, 48,907; Cartagena, the historical port of the Spanish Main, 36,632; Manizales, 34,720; Sonrón, 29,346; Pasto, 27,760; Cali, an important town, 27,747; Aguadas, 26,423; Ibagué, 24,693; Palmira, 24,312; Neiva, 21,852; Montería, 21,521; Yarumal, 21,250; Cúcuta, a coffee centre, 20,364; Bucaramanga, a coffee centre, 19,735; Miraflores (Boyacá), 19,150; Lórica, 19,005; Popayán, 18,724; Cartago, 18,618; Pereira, 18,428.

**EDUCATION.** Primary instruction is free, but not compulsory. In 1916, primary schools numbered 5137, with 325,756 pupils (176,468 males, 149,288 females) and 5733 teachers. Most of the secondary schools, though maintained or assisted by the state, are under the control of Roman Catholic orders. Secondary and professional schools in 1916 numbered 344, with 29,138 students (16,622 males, 12,516 females). In the 43 arts and trades schools there were 2360 students. There are several universities, of which the most important by far is the University of Bogotá, founded 1572. Bogotá has long been a conspicuous seat of Roman Catholic scholasticism. There are mining schools at Medellín and Pasto. Roman Catholicism is the state religion.

**PRODUCTION.** The republic has an immense amount of fertile soil, but only a small proportion is under cultivation. Colombia's coastal and hot regions produce corn, sugar cane, cotton and other fibres, rubber, cacao, and bananas and other tropical fruits. The mountain and upland districts yield coffee, potatoes, wheat, barley, and many other products of the temperate zone. Tobacco and ivory nuts are important products, and banana culture is extending. By far the leading crop commercially is coffee.

fee, which amounts to about 1,000,000 sacks (of 60 kilograms). After Brazil, Colombia exports more coffee than any other country; the bulk of the crop goes to the United States. Cattle raising is a large and profitable industry, for which most of the country is suitable; in many sections the pastures remain green throughout the year. A stock census of 1915 places the number of cattle at 3,034,504; horses, 528,191; asses, 138,631; mules, 200,921; goats, 163,830; swine, 711,482.

Colombia's mineral resources are of exceptional importance, notably in the department of Antioquia, and include copper, lead, zinc, mercury, iron, coal, petroleum, salt, silver, manganese, gold, platinum, and emeralds. Gold is an important export and rich and extensive deposits await development. In the production of platinum, Colombia has been surpassed only by Russia. At present the world's supply of emeralds comes almost entirely from Colombia. Manufacturing has not become important, except the Panama hat industry, which in recent years has developed remarkably. Over four-fifths of the hats produced are sent to the United States. In 1917 there was a marked increase in business activity, due mainly to the stimulus of high prices for Colombian products.

**COMMERCE.** Import and export values are reported as follows:

	1910	1913	1914	1915
Imp. \$17,383,039	\$28,585,780	\$20,979,229	\$17,840,350	
Exp. 17,625,152	34,315,252	32,632,884	31,579,181	

In 1914 and 1915 respectively, leading imports were valued as follows, in thousands of dollars: textile goods, 6785 and 6511; foodstuffs and condiments, 1974 and 2297; metals and their manufactures, 2670 and 1435; agricultural and mining implements and machinery, 897 and 891; drugs and medicines, 771 and 819; railway cars, etc., 1028 and 660; material for light and fuel, 555 and 607; paper, office supplies, etc., 566 and 508.

The following table shows export values by major groups, in thousands of dollars:

	1912	1913	1914	1915
Vegetable products ...	20,792	23,975	17,756	17,585
Mineral products .....	7,769	5,515	6,378	6,837
Animal products .....	2,259	3,883	2,054	2,991
Manufactures .....	1,211	1,017	1,417	1,111
Live animals .....	151	86	18	121
Miscellaneous .....	32	48	33	13
Currency .....	8	312	1,484	...
Additional value * .....	...	...	3,495	2,898
Total .....	32,222	34,315	32,633	31,579

\* Addition for market values over customs house values, coffee and hides.

The principal articles of export in 1914 and 1915 respectively were as follows, in thousands of dollars: coffee, 16,098 and 14,128; gold, 4746 and 5447; cattle hides, 2704 and 2901; bananas, 2988 and 1977; Panama hats, 1372 and 967; ivory nuts, 327 and 343; tobacco, 392 and 335; rubber, 175 and 253; gold coin in 1915, 511.

In 1914, imports from the United States were valued at \$6,486,749; United Kingdom, \$6,346,386; Germany, \$2,570,424; France, \$1,249,374. Exports by countries, in thousands of dollars:

	1912	1913	1914	1915
United States .....	15,833	18,862	18,272	21,946
United Kingdom ....	4,376	5,566	5,874	8,692
Venezuela .....	...	...	...	1,591
Spain .....	803	...	52	420
France .....	625	798	458	254
Germany .....	1,854	3,216	1,779	...
Additional value * ..	...	...	3,495	2,898

\* See note to preceding table.

**COMMUNICATIONS.** The roads of the country are in general merely mule tracks, but some of the main thoroughfares have been made usable for ordinary vehicles and automobiles. The great river of the country, the Magdalena, together with its tributaries, affords means for a considerable amount of traffic, but it is impassable at several points on account of rapids and has a bar at its mouth. The peculiar geographical features of the country render the construction of extended railway lines a very expensive and difficult undertaking. There is no continuous railway system, but various lines from 10 to 108 miles in length engage in local traffic. The total length of railway in operation is about 700 miles. A bridge over the river Coello at Chicoral, Department of Tolima, was to be erected for the Tolima Railroad under construction in 1917. In this connection the Minister for Public Works recommended that, when possible, a long iron span be constructed over the Magdalena River to connect the Girardot and Tolima Railroads.

There are about 12,000 miles of government telegraph lines, with 625 offices. Reported number of post offices, 843. Contracts have been made for establishing wireless-telegraph stations at Bogotá, Buenaventura, Medellín, Santa Marta, Cartagena, and the island of San Andres.

**FINANCE.** The standard of value is gold. The monetary unit is the dollar, valued at 97.33 cents. The redemption of the paper currency and the restoration of metallic money to circulation have been undertaken by the government. The value of the paper peso is fixed by law at one one-hundredth of the monetary unit, but its actual purchasing power is somewhat variable. Revenue and expenditure for fiscal years are shown below, in thousands of dollars (the figures for 1916 and 1917 are budget estimates):

	1913	1914	1915	1916	1917
Rev. ....	17,386	18,650	12,055	14,860	14,885
Exp. ....	15,532	14,772	12,825	17,115	16,870

Principal items of estimated revenue for the fiscal year 1916, in thousands of dollars: customs, 6600; salt tax, 1180; stamps, 850; telegraphs, 550; consular dues, 300. Chief departmental disbursements, as estimated for the fiscal year 1916, in thousands of dollars: finance, 5772 (including national debt service, 4607); interior, 5518; war, 2496; public instruction, 1103; public works, 946; foreign affairs, 345. Foreign debt, January 1, 1917, \$3,817,787; internal debt, July 1, 1916, 4,557,781 dollars gold. There is a large outstanding paper currency.

**GOVERNMENT.** The legislative power is exercised by a congress of two houses, the Senate and the House of Representatives. Senators (35 in number) are elected by indirect vote for four years; representatives (92), by direct vote for two years. The congress meets at Bogotá on July 20 of each year. The executive authority

is vested in a president, elected by direct vote for four years. He is assisted by a cabinet of eight members. There is no vice-president, but two *designados*, first and second, are elected annually by the congress to succeed to the presidency in case of the chief executive's death or disability. The president for the term ending August 7, 1918, is José Vicente Concha, who succeeded Carlos E. Restrepo August 7, 1914. See UNITED STATES, *Foreign Relations*.

**COLORADO. POPULATION.** The population in the State in 1910 was 799,024. The estimated population on July 1, 1917, was 988,320.

**AGRICULTURE.** The acreage, production, and value of the principal crops as estimated by the United States Department of Agriculture in 1916-17 were as follows:

	Acreage	Prod. bu.	Value
Corn .... 1917	532,000	10,640,000	\$13,300,000
1916	475,000	7,362,000	8,626,000
Wheat ... 1917	600,000	13,536,000	26,124,000
1916	600,000	11,885,000	17,828,000
Oats .... 1917	283,000	11,134,000	8,462,000
1916	280,000	9,570,000	5,742,000
Potatoes . 1917	70,000	6,900,000	8,472,000
1916	50,000	7,155,000	9,315,000
Hay ..... 1917	970,000	a 2,378,000	39,442,000
1916	970,000	1,988,000	21,868,000

a Bales of 500 pounds gross weight.

**MINERAL PRODUCTION.** The production of gold in the State in 1915 was valued at \$22,414,944 and at \$19,153,821 in 1916. There were produced in 1916, 7,656,544 fine ounces of silver, 70,914,087 pounds of lead, 8,624,081 pounds of copper, and 134,285,463 pounds of zinc. The total value of these metals was \$49,200,675. The gold produced showed a decrease of \$3,261,123, silver an increase of 628,572 ounces, lead an increase of 2,103,490 pounds, copper an increase of 1,511,544 pounds, and zinc an increase of 29,690,469 pounds. The net increase in the value of all metals was \$5,773,978. In the production of gold Colorado ranks second, and is surpassed only by California. The coal production of the State in 1916 was 10,484,237 short tons, valued at \$16,964,104, an increase of 1,859,257 tons, or nearly 22 per cent as compared with 1915. There were employed in the coal mines of the State in 1915, 12,372 men, compared with 13,104 in 1916. The supply of labor was in general adequate. The State is a considerable producer of petroleum. There were marketed in 1916, 197,235 barrels, which was a decrease of 5.39 per cent from the corresponding output for 1915.

The output of gold, silver, lead, and zinc in the State in 1917, according to the estimates of the United States Geological Survey, amounted to \$16,020,000 in gold, 7,327,000 ounces in silver, 67,500,000 pounds of lead, 8,700,000 pounds of copper, and 114,000,000 pounds of zinc, with the total value of nearly \$40,600,000, compared with a total value of about \$49,200,675 in 1916. Copper showed an increase, but there were decreases in gold, silver, lead, and zinc output. The gold output of Cripple Creek was \$10,549,000, a decrease of \$1,570,000.

**TRANSPORTATION.** The railway mileage on June 30, 1916, was 5646 miles. The railroads having the longest mileage were: Denver and Rio Grande, 1579; Colorado and Southern, 808; Union Pacific, 591; Atchison, Topeka, and Santa Fé, 506.

**FINANCE.** The report of the State Treasurer

for the biennial period ending November 30, 1916, showed a balance on hand on December 1, 1914, of \$4,856,086. The receipts for the period amounted to \$13,058,072, and the disbursements were \$12,040,912, leaving a balance in the treasury on December 1, 1916, of \$5,873,246. The total bonded indebtedness of the State at the end of the fiscal year amounted to \$3,762,700.

**EDUCATION.** The latest school census for which statistics were available in 1917 was for 1915; in that year, there were 237,264 children of school age in the State. The total enrollment was 184,471, with an average daily attendance of 134,758. The total number of teachers in graded schools was 4121, of which 3401 were female and 720 were male teachers. In the rural schools there were 2452 teachers, of which 2122 were female and 330 were male. The average monthly salary of graded school male teachers was \$103.44 and of female teachers \$71.10. In the rural schools the average monthly salary of male teachers was \$68.42 and that of female teachers was \$60.20. The total disbursements for school purposes were, in 1915, \$7,940,174.

**CHARITIES AND CORRECTIONS.** The charitable and correctional institutions of the State include, the State Home for Dependent and Neglected Children; Soldiers' and Sailors' Home; Industrial Work Shop for the Adult Blind; State Home and Training School for Mental Defectives; State Insane Asylum; Industrial School for Boys; Industrial School for Girls; State Penitentiary; and the State Reformatory.

**POLITICS AND GOVERNMENT.** There were no elections in the State during the year, and political interest centred about the session of the Legislature. The most notable measures passed are given in the section *Legislation* below. On March 24, four days before President Wilson delivered his historic address at the joint session of Congress, and eight days before the declaration of a state of war with Germany, the governor called together a voluntary group of citizens to advise and aid in the direction of Colorado's war activities. The increase of Colorado's bean acreage from 38,000 to 243,000 acres, the rediscounting rates established by the banks, and other financial aid given the farmers through the State and county organizations are results evidencing success.

Following is some of the war work done by Colorado: The special legislature voted \$2,500,000 war bonds. In all, 83,874 men between 21 and 30 were subjected to draft registration. The first call for the draft army conscripted 4800 men. Colorado National Guardsmen, numbering 4200, were federalized. The State subscribed \$40,017,850 to the two Liberty loans, making a \$40 per capita subscription. Voluntary enlistments in the army and navy totaled 20,550. Thrift stamp sales for government war purposes aggregated 200,000. The Y. M. C. A. raised \$500,000 for war work. For the Red Cross war fund, \$1,400,000 was raised. Membership in the American Red Cross in Colorado was increased by 155,000.

**LEGISLATION.** Tightening the screws on liquor selling by providing the machinery for the enforcement of the law, passing a generous appropriation for the support of its educational institutions, and marshaling all the resources of the Commonwealth for the successful prosecution of the war, the State of Colorado

made the year 1917 one of the most conspicuous and brilliant in its history. Among the other important bills passed by the twenty-first legislature was the "pure seed law," of inestimable benefit to the agricultural interests of the State; a statute providing for State investigation and control of smelters; an appropriation for the equipment of the military forces of the State; the establishment of a State constabulary to take the place of the federalized National Guard; and a number of acts facilitating the coöperation of the State with the government's plans for the conservation of the Nation's resources. The school-fund-farm-loan law, whereby moneys derived from school funds can be drawn upon for loans to farmers, was upheld as constitutional by the State supreme court. The law was initiated by the *Great Divide*, a farmers' publication of Denver.

Amendments were made to the laws relating to election. Women voters are required only to state that they are over 21 years of age to register. Amendments were made to laws affecting liquor regulations. An industrial commission of the State was made a minimum wage board to fix the wages of women and minors under 18. Any person, who, under false pretenses, gains the labor of another, is made a swindler punishable by fine and imprisonment. Drastic penalties were imposed for the stealing of automobiles. The laws relating to property were amended.

**STATE OFFICERS.** Governor, Julius C. Gunter, Dem.; Lieutenant-Governor, James A. Pulliam, Dem.; Secretary of State, James R. Noland, Dem.; Treasurer, Robert H. Higgins, Dem.; Auditor, Charles H. Leckenby, Dem.; Adjutant-General, Frank J. Baldwin, Dem.; Attorney-General, Leslie E. Hubbard, Dem.; Superintendent of Education, Mary C. C. Bradford, Dem.; Commissioner of Insurance, Claude W. Fairchild, Dem.

**JUDICIARY.** Supreme Court: Chief Justice, S. Harrison White; Justices, S. H. White, W. A. Hill, M. S. Bailey, Tully Scott, James E. Garrigue, James H. Teller, Geo. W. Allen, Clerk, James R. Killian.

**COLORADO, UNIVERSITY OF.** A co-educational State institution of learning at Boulder, Colo. In the fall of 1917 there were 1175 students and 200 members of the faculty. Volumes in the library numbered 110,000. Productive funds in 1917 amounted to \$75,000 and total income to \$375,000. In 1917 ex-Governor H. S. Hadley of Missouri was made professor of law; Arthur Chapman of Denver, instructor in journalism; Thomas M. Marshall, assistant professor of history; Edwin W. Patterson, assistant professor of law; and William Black, professor of steam and gas engineering. The university was founded in 1876. President, Livingston Farrand, LL.D.

**COLOBRATION.** See ZOOLOGY.

**COLORED METHODISTS:** See METHODISTS, COLORED.

**COLUMBIA UNIVERSITY.** A non-sectarian institution of learning whose principal buildings are at Morningside Heights in New York City. Allied corporations on this site are Barnard and Teachers College. The Medical School (College of Physicians and Surgeons) is on West Fifty-ninth Street, and the College of Pharmacy on West Sixty-eighth Street. The university also has a summer camp occupying more than 585 acres at Morris, Conn. In the fall of 1917

there were registered in all courses 6451 students as follows: Columbia College (academic department for men), 1185; Barnard College (academic department for women), 657; law, 199; medicine, 527; science, 77; architecture, 44; journalism, 72; business, 67; Teachers College, 2068; pharmacy, 524; graduate schools, 874; unclassified, 157. In addition to the above there were 4391 students in the extension classes, and 6144 were enrolled in the 1917 summer session. The faculty and administrative force, not counting sixteen retired officers, totaled 1074 as follows: Professors, 180; associate professors, 56; assistant professors, 113; clinical professors, 26; associates, 58; instructors, 280; curators, 3; lecturers, 72; assistants, 128; clinical assistants, 108; officers (not also teachers), 50. Volumes in the library number 675,000. The Bushe-Fox Collection of books and manuscripts in English Legal History was acquired by the library in 1917. In 1917 the income from all sources amounted to \$3,248,683.61, made up as follows: from students' fees, \$1,378,816.63; from endowment, \$889,343.24; from special funds, \$347,945.71; from gifts and from receipts for designated purposes, \$194,849.63; from payments from allied corporations, \$415,745.20; from miscellaneous sources, \$21,983.20. By death the university lost in 1917 Thomas F. Main, secretary of the College of Pharmacy; B. Aymar Sands, trustee of the university; Mrs. Henry W. Munn, trustee of Barnard College; and George L. Rives, trustee of the university and chairman of the board for many years. Resignations from the teaching staff were received from Associate Professor Floyd J. Metzger (chemical engineering); Professor George E. Brewer (surgery); Associate Professor Homer F. Swift (medicine); Professor William G. MacCullum (pathology); Professor M. C. Whitaker (chemical engineering); Assistant Professor J. Gardner Hopkins (bacteriology); Assistant Professor Harold V. Keyes (physical education); Professor James F. Kemp (geology); Professor Charles A. Beard (politics); Associate Professor Henry R. Mussey (economics). Chairs held by Professor James McKeen Cattell (psychology) and Associate Professor Henry W. L. Dana (English) were declared vacant. New appointments included Thomas I. Parkinson to a newly established professorship of legislation in the Law School, made possible by a gift of \$150,000 from Joseph P. Chamberlain; Fernand Baldensperger of the Sorbonne, professor of French literature; William Chandler Bagley, professor of education; Leo H. Baekeland and Ralph H. McKee, advisers in chemical engineering; Capt. R. Hodder Williams, instructor and adviser in military matters; Otis W. Caldwell, professor of education; Arthur D. Dean, professor of education. Of the teaching staff, George Willis Botsford, professor of ancient history, and Franklin Matthews, associate professor of journalism, died. Gifts to the university for the academic year ending June 30, 1917, were 154 in number, and amounted to \$1,238,221.12, including \$150,000 mentioned above for the Chair of Legislation; and \$50,000 from George W. Brackenridge to enable provision to be made for the admission of women as students of medicine. The latter provided for the erection of a new building at the medical school. Other additions to the university plant include the Van Amringe Quadrangle,

erected by the alumni in honor of the late J. Howard Van Amringe; and the Columbia War Hospital, erected on university-owned property in the Borough of the Bronx. Extension of the university work in 1917 included furtherance of plans for a medical centre in New York City; the establishment under the direction of Teachers College of the Lincoln (experimental) School for the purpose of scientific experimentation and constructive work in the reorganization of elementary and secondary education; and the creation of a department of religion, which put the direction of religious and social work in the hands of an administrative board. The Pulitzer prizes in journalism and letters and the Pulitzer traveling scholarships were awarded first in 1917. Eight productions of grand opera were given in the summer session by members of the chorus school and the orchestra of the Metropolitan Opera Company.

When diplomatic relations between Germany and the United States were severed, Columbia met in University Assembly. A plan of mobilization of the university's resources was drawn up and later approved by the Bureau of Education of the interior department and submitted by the bureau to all colleges and universities in the country as a model. The university organized in April and completed early in the summer a war hospital with 500 beds, the equipment being doubled in capacity later in the year and turned over to the government as United States Army General Hospital No. 1. More than a thousand students of the undergraduate department took courses in military training, and more than 2000 left the university before June 1, 1917, to go into the military and naval arms of the government service. At the end of the year it was estimated that between 9000 and 10,000 Columbia alumni and former students were in government service. Leaves of absence were granted to approximately 200 members of the faculty to engage in war work. Columbia raised more than \$50,000 in the Y. M. C. A. Friendship Fund campaign. A series of "war papers" illustrative of the university's part in the strictly non-military problems created by the war were issued to a reading public estimated at 20,000,000. Honorary degrees were conferred at a special university convocation on May 10 to Hon. Arthur James Balfour, Baron Cunliffe, René Viviani, and Marshal Joffre. Two complete ambulance units were donated by the alumni to the American Field Service in France. The government established on the campus in June a naval reserve school, the faculty of the engineering department providing instruction. This was later transferred to Pelham Bay and instead a gas engine school was established at Columbia for training, particularly in submarine-chaser work. An arrangement was made with the New York Nautical School for training in seamanship and instruction in navigation on the U. S. S. *Newport*, anchored in the Hudson River near the university. Women of the university were organized for service under the direction of a Committee on Women's War Work which placed before wives, daughters, and friends of members of the university opportunities for assisting the Navy Board; Bureau of Municipal Research; Red Cross and affiliated organizations; La Service de Santé; American Ambulance Corps; Home Economics Committee; National Surgical Dressings Committee; Trench

Comfort Packets Committee; Committee on Training Camp Activities; War Service Bureau; U. S. Food Conservation Commission; Y. M. C. A.; Y. W. C. A.; Council of National Defense, etc.

Columbia University was founded as Kings College in 1754. President, Nicholas Murray Butler, Ph.D., Jur.D., LL.D., Litt.D.

**CONCRETE.** Concrete continued during 1917 as a leading structural material for architecture and engineering purposes. While there were a few shortcomings and mistakes to be noted, there was a vast record of successful achievements and many striking examples of the versatility of design and construction. In America, the desire for simplicity and size, particularly in industrial structures, had led to developments far in excess of anything accomplished or even contemplated by French and German designers, who at the beginning were more daring in their use of this material than architects and engineers in the United States. The wide span of floor slab was developed to a striking degree during 1917, and also the use of high columns as well as various modifications, some of which are indicated in the accompanying paragraphs.

**ELEVEN-STORY WAREHOUSE FOR U. S. NAVY.** A notable construction of the year was a reinforced concrete storehouse at the Brooklyn Navy Yard, capable of holding 7000 tons of supplies. This building 11 stories high, 180 ft. by 360 ft. in plan, and with monolithic-finished floors, was completed so far as the concrete frame was concerned, within fourteen weeks after the last piles were driven for the foundation footings. A labor force consisting of 500 men working one eight-hour shift a day with two 1-yd. mixers and hoists, was engaged continuously and completed several of the floors in four days and several in five days. The building was founded on 3776 concrete piles whose tops were at original ground level and a fill of four feet was placed between the external retaining walls underneath the first floor. The building was designed with rectangular outside and round inside columns, spaced 18 ft. centre to centre uniformly throughout the building, affording 60 rectangular columns and 171 circular interior columns, metal forms being used in constructing the latter. Motor trucks were used exclusively

and as fast as one floor was finished, the construction below was pushed forward; in fact the curtain walls, tile partitions, stairs, steel sash, elevator intallation and trim were all begun after the fourth floor was completed and carried forward as progress was made.

**MECHANICAL CONSTRUCTION OF CONCRETE PILES.** The increased use of concrete for piles, poles, and similar purposes, naturally led to mechanical means for their manufacture. In Europe, a centrifugal process had been developed by which a cylindrical mold filled with concrete was revolved around a longitudinal axis until the concrete had been forced into a hollow cylinder and then duly set. During the year, a similar process was being carried on with considerable success in the United States on a commercial basis.

In this method, the lower half of a circular metal form was placed on rollers so as to connect with a machine by which it could be revolved in a horizontal position. This lower half of the form was filled with concrete material, a cage of reinforcing steel was adjusted in its position, and the upper half of the form was then clamped on the lower. The mold was rolled into the machine where it could be appropriately clamped and revolved for a period of several minutes at a high rate of speed. The effect of the centrifugal force developed, was to produce a pressure against the inside of the form varying from 75 to 300 lb. per sq. in. so that a dense concrete structure was obtained with a smooth central hole. After the set takes place in the cement, the pole is removed in the form and allowed to set for twelve hours before the mold is removed, and then to harden for ninety-six hours. A further period of ten days for curing is required before the finished pole can be shipped. The elimination of moisture in the centrifugal treatment and the intense pressure causes a dense and hard product, while the weight of a hollow centrifugal pole is 50 per cent less than a solid concrete pole of equal strength and only two and one-half times that of the best cedar poles, which were said to have but one-half of the strength of a concrete pole.

**A CONCRETE COLD STORAGE WAREHOUSE.** An eleven-story concrete cold storage warehouse was built during the year by the Merchants' Refrigerating Company on the Hudson River waterfront at Sixteenth and Seventeenth Streets and Tenth and Eleventh Avenues, New York City. This building had 10 stories and a basement, mezzanine, and attic. It was 150 ft. in height and covered an area of 1.4 acres, extending 184 ft. along Tenth Avenue and back to Eleventh Avenue, which was 286 ft. distant on West Sixteenth Street, and 357 ft. distant on West Seventeenth Street. The structure was of reinforced concrete frame throughout and was novel in that separate columns and intermediate walls were required for insulation to divide the building into five separate parts. This building was fully discussed in the *Engineering News-Record* for November 15, 1917.

**NEW CHICAGO ORDINANCE.** During 1917, the Chicago Department of Buildings revised a ruling on the design of the reinforced concrete flat-slab floor which had figured widely as a standard method of computing for this type of construction. The new ordinance changed certain features due to the development of the art,

and the vast experience obtained in this type of construction. The new ruling was issued by Charles Bostrom, commissioner of buildings, and was to become effective January 1, 1918. It dealt in detail with columns, slab thickness, panels, stresses, walls and openings, beams, and indicated the general method of computing the stresses and the general design of the work in various systems of construction.

**A LONG SPAN.** In the design of the frame for twin buildings for the Emory University at Atlanta, Ga., a distinct novelty in concrete construction was a floor slab with a clear span of 37 ft. 6 in. Another innovation was a spiral stairway in one of the buildings and a roof girder of 52 ft. 2 in. span which not only carried the roof load but an 8-in. concrete partition which was deemed too heavy for the long floor span.

**CONCRETE SHIPS AND BARGES.** One of the important developments of the year has been the attention that has been paid to concrete ships, several of which had either been launched or were under construction in both Europe and America. Much of the information published in this field was sensational, but apparently there was no reason why concrete barges and motor-driven vessels of limited capacity should not be built with considerable success. A Joint Committee on Concrete Ships and Barges was appointed by the American Concrete Institute and the Portland Cement Association, and Robert W. Boyd was retained as consulting engineer. The members of the two committees were as follows:

American Concrete Institute—H. C. Turner, chairman; Leonard C. Wason, Robert W. Lesley, Charles R. Gow, M. M. Upson.

Portland Cement Association—E. D. Boyer, chairman; Joseph Brobston, F. W. Kelly, W. S. Mallory, S. P. Crabo.

An active investigation was being undertaken to determine the possibility of this type of construction. See SHIPBUILDING.

**CONCRETE IN SEA-WATER.** An interesting series of articles on the deterioration of concrete in sea-water with suggestions as to the cures was published in the *Engineering News-Record* (September 20, 1917, et seq.) during the year by Rudolph J. Wig of the United States Bureau of Standards and Lewis R. Ferguson of the Portland Cement Association. These experts made a two year investigation which included the inspection and study of nearly every cement structure in the United States and reports of many in foreign countries. Their conclusion was that in many cases a rapid deterioration would result from the inappropriate proportions of water in mixing the concrete, while there needed to be many modifications in the reinforcement and protection of concrete. The destruction of concrete structures which was in process along all American sea-coasts irrespective of whether freezing conditions existed or not, was due to a number of causes. All well made Portland cement would resist destruction in sea-water if properly used, but greatest care must be manifested in the entire process of mixing and placing. In particular these authorities determined that accurate proportions, judicious use of water, tight forms, and good contractors, and efficient inspection were needed to bring concrete to proper condition to resist sea-water action. They believed that concrete could be used suc-

cessfully in sea-water, but the price of success was eternal care.

**TESTING A FLOOR TO DESTRUCTION.** An interesting test of a reinforced concrete eight-story warehouse building, which was being removed to clear the site for the new Union Station at Chicago, was made when four adjacent panels on the sixth floor were loaded with pig iron until failure took place. These panels were 19 ft. 4½ in. by 17 ft. 5½ in. centre to centre of columns and carried four-way reinforcement with 15 high-carbon steel bars ⅝ of an inch in diameter in each reinforcing band which was 7 ft. wide. The slab was 8½ in. thick made of gravel concrete 1:2:4. Various test loads consisted of pig iron stacked in four piles on each of the four panels and was applied in increments of about 200 pounds per sq. ft., until a total of 910 lbs. per sq. ft. was reached. The readings of deflection of concrete and steel were taken after each increment of loading. The maximum deflection was 1.1 in. and the approximate stresses at the maximum load were 31,000 lbs. in direct rods and 52,000 lbs. in diagonal rods. At the centre of the panel, 23,800 lbs. in direct rods and 18,400 lbs. in diagonal rods. The building was built in 1909 and 1910 and this test of destruction was made under the direction of Professor A. N. Talbot of the University of Illinois and aroused considerable interest.

See **ARCHITECTURE; BRIDGES; BUILDING OPERATIONS; CEMENT; ELEVATORS, GRAIN.**

**ONGO, BELGIAN.** A central African colony of Belgium, formerly the Congo Free State; founded in 1885 by King Leopold II, who endorsed (October 18, 1908) its annexation to Belgium.

**AREA AND POPULATION.** The colony covers an area of 2,365,000 square kilometres (913,127 square miles); white population January 1, 1912, 5465; January 1, 1915, 3525 (without Katanga and Kivu). No official estimate of native population is given; other sources vary from 9 to 20 millions. Besides Boma, important towns are Matadi, Banana, Leopoldville, Stanleyville, Kambove, Niangara, Bandundu, etc.

**PRODUCTION.** The chief products of the country are shown in the list of exports, rubber leading in importance until 1914, when copper displaced it. The Kilo gold mine, in the Ituri basin, not far from Lake Albert, had 8 experts and 1760 negro workers. Gold is also found in the Katanga district. The output of the copper mines in 1915 was said to be 14,040 tons. Ivory is an important product; cattle thrive in the highlands.

**COMMERCE.** Total imports (general trade) in 1915, 18,361,325 francs (unofficial returns); exports, 25,504,175 francs. In 1911, 58,385,000 and 78,955,000 francs. In 1912, 61,864,000 and 83,465,000. Exports for comparative years are shown below, values in thousands of francs:

	1911	1912	1913	1914
Rubber .....	34,427	34,519	27,520	10,631
Copal .....	1,314	6,385	8,935	6,294
Ivory .....	5,683	5,552	11,675	7,092
Copper .....	1,834	4,112	3,685	15,520
Gold .....	3,119	3,332	6,000	3,195
Palm nuts .....	2,879	2,771	4,344	3,623
Palm oil .....	1,732	1,253	1,342	1,574
Cacao .....	896	1,115	1,036	...

The table below shows leading imports in 1914 and 1915, values in francs:

	1914	1915
Cottons .....	4,019,886	2,253,511
Provisions .....	2,988,892	4,778,145
Wines and spirits .....	2,155,094	817,098
Metals .....	1,156,609	30,752
Machinery .....	1,683,719	1,340,834
Sea vessels .....	1,670,192	129,900
Arms and ammunition .....	505,561	71,387

Imports in 1914 to the value of 22,309,228 francs came from Belgium, and exports valued at 5,344,918 francs went to Belgium; United Kingdom, 36,196,208 francs imports, and 11,346,915 francs exports; Germany, 3,001,982 imports; France, 886,711 imports; Netherlands, 682,446 imports and 801,713 exports; etc. There were entered at the ports in the 1915 trade, 64 vessels of 170,041 tons.

**COMMUNICATIONS.** The total length of railways on January 1, 1916, was 1020 miles, divided as follows: Matadi-Leopoldville, 248 miles; Mayumbe Railway (Boma to Tshela), 70 miles; the Stanleyville-Ponthierville line, 77 miles; Kindu-Kongolo, 220 miles; Bukama-Luena, 25 miles; from the Rhodesian frontier to Lubudi via Elizabethville, 370 miles; the Katanga branch line to Lubumbashi, 1 mile; to Mikola, 9 miles. Two sections of the Cape-to-Cairo Railway are included in the system. The distance from Elizabethville, Katanga, on the Cape-to-Cairo Railway, to Cape Town is about 2300 miles. The total length of the Great Lakes Railway is 165 miles. It was completed in March, 1915, and links up the whole of the Upper Congo with the railway from Dar-es-Salaam to Ujiji.

The Congo is navigable for about 100 miles from its mouth to Matadi, and on this section there were 17 steamers government-owned. Above, for over 200 miles, are numerous rapids, which render the river unnavigable as far as Stanley Pool (Leopoldville), above which are 1600 miles of navigable water, as far as Stanley Falls.

**FINANCE AND GOVERNMENT.** Financial statistics appear in the table below in thousands of francs for four years (budget estimates):

	1911	1913	1914	1916
Revenue .....	40,870	40,418	30,451	32,049
Expenditure ...	59,658	50,933	† 63,076	54,756

\* Including 12,222,443 francs extraordinary.

† Including 11,139,573 francs extraordinary.

The total debt amounts to 278,747,200 francs. A governor-general administers the colony.

**ONGO, FRENCH.** See **FRENCH EQUATORIAL AFRICA.**

**ONGO FREE STATE.** See **ONGO, BELGIAN.**

**CONGREGATIONALISM.** According to official statements there were in this denomination in the United States at the beginning of 1917, 6089 churches, 5660 ministers, of whom 3684 were pastors and 1976 without charges, 795,793 church members and 773,028 Sunday school scholars. There were 3201 Young People's Societies, with 134,258 members, and 1590 Men's and Boys' Organizations, with 91,326 members. The home expenses of the churches of the denomination were \$10,865,414. The amount of salaries paid was \$4,974,612, an average of \$1099 for each pastor. The value of church property was \$92,282,943; invested funds amounted to \$11,462,747; debts, \$4,293,647. The national societies include the Congregational Educational Society, the American Board of Com-

missioners for Foreign Missions, the Congregational Home Missionary Society, the American Missionary Association, the Congregational national societies include the Congregational Ed-Church Building Society, the Congregational Board of Ministerial Relief, and the Congregational Sunday School and Publishing Society.

The woman's work of the denomination centres in the Woman's Home Missionary Federation as representing the homeland societies, and in the Woman's Board of Missions, as representing the foreign activities. The report of the Board of Commissioners for Foreign Missions showed that the year's receipts were the largest in its history—\$1,207,126; and that the expenditures were \$1,206,209. Despite this gratifying increase in receipts it was impossible to keep the income up to the urgent needs of these growing missions. The eighteen fields of the American Board are distributed in sixteen lands; seven of these, Turkey, Albania, Serbia, Bulgaria, Greece, Austria, and, until recently, Mexico, were ravaged by war; but notwithstanding this deplorable condition of world affairs missionary work went on in some cases with almost no interruption and in all cases with rewarding results. In Turkey missionaries were able carefully to distribute large sums of relief money. In the Balkan States schools were continued without interference and missionary life went on much as in peaceful times. Missionaries had to be withdrawn from Mexico; schools were closed and building undertakings were stopped. Nevertheless the Mexican pastors held their churches together and watched over their congregations faithfully. In lands not ravaged by war—China, Japan, India, Ceylon, and parts of Africa—the year was one of progress; but the call for help in China and the Philippines was very urgent.

The Home Missionary Society carried on work during the year in 27 States and Territories and the constituent State societies in 18 more. The number of missionaries was 1729, who cared for 2401 churches and preaching stations. Connected with these churches were 2186 Sunday schools. The receipts of the society for the year were \$641,840. During the year 63 new churches were organized, 53 new church buildings were erected and 29 parsonages built. There were 10 theological seminaries in the denomination, with 72 professors and 466 students. The general administration of the church is under the control of the National Council. The social work is in the hands of the Social Service Commission of the Congregational Church, which is a development from the work of the Department of Labor and Social Service of the Congregational Brotherhood of America. The officers of the National Council for 1915-17 were: Moderator, Hon. Henry M. Beardsley; assistant moderators, Rev. William Horace Day and Rev. Alfred Lawless, Jr.; secretary, Rev. Hubert C. Herring; treasurer, Rev. John J. Walker.

Outside of the United States the number of Congregational churches, chapels, and stations was 14,666, with a membership of 1,711,796 and a Sunday school membership of 1,746,121. Of this total Great Britain and Ireland had a total of 5006 churches, chapels, and stations, 732,111 members, 757,820 Sunday school members. Canada had 159 churches, chapels, and stations, 13,834 church members, and 10,366 Sunday school members. Australasia had 483 churches,

chapels, and stations, 21,760 church members, and 37,862 Sunday school members. South Africa had 290 churches, chapels, and stations, 20,920 church members, 8821 Sunday school members.

**CONGREGATIONAL METHODIST CHURCH.** This denomination was formed as the result of a secession in 1882 from the Methodist Episcopal Church, South. The reason for this was dissatisfaction with certain features of the Episcopal form of church government and of the itinerary. The seceders adopted the Congregational polity, but modified by a certain degree of connectionalism, and they chose the name Congregational Methodist Church. According to the latest statistics available the denomination in 1916 had 337 ministers, 333 churches, and 15,529 communicants. The publishing house is at Ellenville, Miss., the place of issue of *The Messenger*, the official journal of the denomination.

**CONGRESS.** See UNITED STATES; UNITED STATES AND THE WAR.

**CONN, HERBERT WILLIAM.** An American biologist, died in Middletown, Conn., April 18, 1917. Born at Fitchburg, Mass., in 1859, he graduated from Boston University in 1881 and three years later, as Ph.D., from Johns Hopkins. From then till his death he was a member of the faculty of Wesleyan University, rising to be professor in 1889. Dr. Conn also served as director of the Cold Spring Harbor (N. Y.) Biological Laboratory from 1889 to 1897, as bacteriologist of the Storrs (Conn.) Experiment Station from 1890 to 1906, and after 1905 as director of the laboratory of the Connecticut State Board of Health. An authority on the bacteriology of dairy products, he published more than 150 scientific memoirs and a number of books, ranging from popular presentations to highly technical treatises. Among them are: several text books on physiology and hygiene; *The Story of Germ Life*; *The Story of Life's Mechanism*; *Bacteria, Yeasts, and Molds in the Home*; *Agricultural Bacteriology*; *Bacteria in Milk and its Products*; *Biology*; *Social Heredity and Social Evolution*. In 1902 Professor Conn was honored by the presidency of the American Society of Bacteriologists.

**CONNECTICUT. POPULATION.** The population in the State in 1910 was 1,114,756. The estimated population on July 1, 1917, was 1,265,373.

**AGRICULTURE.** The acreage, production, and value of the principal crops as estimated by the United States Department of Agriculture in 1916-17 were as follows:

	Acreage	Prod. bu.	Value
Corn . . . 1917	95,000	4,845,000	\$10,417,000
1916	70,000	3,010,000	3,612,000
Oats . . . 1917	20,000	660,000	521,000
1916	17,000	510,000	352,000
Potatoes . 1917	29,000	110,000	164,000
1916	22,000	95,000	175,000
Hay . . . 1917	350,000	a 525,000	10,238,000
1916	370,000	574,000	10,619,000
Tobacco . 1917	21,000	b 29,540,000	11,843,000
1916	22,200	36,186,000	9,770,000

a Tons. b Pounds.

**TRANSPORTATION.** The railway mileage in the State in 1916, the latest date for which statistics were available in 1917, was 999. There was practically no construction during 1917. The railroads having the longest mileage were: New York, New Haven, and Hart-

ford, 850; Central New England, 83; Central Vermont, 58.

**FINANCE.** The total receipts for the fiscal year 1917 amounted to \$15,388,999, the expenditures amounted to \$10,212,175, leaving receipts in excess of expenditures amounting to \$5,174,824. The bonded debt of the State amounted to \$12,535,102. There were paid during the year \$416,000 in bonds. At the beginning of the fiscal year there was a balance on hand of \$507,561.

**EDUCATION.** The total school population of the State in 1915-16, the latest year for which statistics were available in 1917, was 302,026; the total enrollment was 234,609; the average daily attendance was 182,477. There were 6013 female and 410 male teachers. The average monthly salary of men teachers was \$127.03 and of women \$63.06. The total expenditures by towns for school purposes was \$9,586,798.70.

**CHARITIES AND CORRECTIONS.** The charitable and correctional institutions of the State include the Soldiers' and Sailors' Home at Noroton Heights; Connecticut Hospital for the Insane at Middletown; State Hospital for the Insane at Norwich; State Prison at Wethersfield; School for Boys at Meriden; Industrial School for Girls at Middletown; Colony for Epileptics at Mansfield; and the Connecticut Reformatory at Cheshire for young men offenders. The School for Imbeciles at Lakeville was removed to Mansfield, and at the insane asylum of Norwich there was established a State farm for drunkards. A woman's reformatory was ordered.

**POLITICS AND GOVERNMENT.** The population of the State, in September, 1917, based on the enumeration of school children, was 1,410,193, an increase of 205,411 over that of the census of 1910. The enumeration of children between 4 and 16 years of age, for distribution of the State's fund for public schools, showed 314,614 in September, an increase of 12,506 in a year.

The chief interest of the State during 1917 was, of course, the war. Marcus H. Holcomb of Southington, retired from the superior court in 1914 because he had reached the Constitutional limit of 70 years, was elected governor in that year and again in 1916. Despite his years, Governor Holcomb put his State first in the country in preparation for the new conditions, and took his place among the spirited war governors in Connecticut history. Under his vigilant leadership, a complete census of the resources of the State in men and materials was begun three days after the break of relations with Germany, and a full card index at the end of the year held this information for ready reference. Under his lead the first home guard was established. This body consisted at the end of the year of 20,000 members, of whom 10,000 were armed and equipped. The guard was specially commended by the Federal War Department.

When the Federal government decided that wartime activities in the several States should be controlled by State councils of defense, the Connecticut State Council of Defense was appointed, with 11 members and R. M. Bissell, Yale 1883, president of the Hartford Fire Insurance Co., as chairman. The Council has subsidiary organizations in every county and town in the State, with headquarters at the Capitol in Hartford. The Legislature, in session from January 3 to May 17, 1917, passed probably the most far-reaching law on its books. It authorized the governor, in the war emer-

gency, to take any steps he might deem necessary, as one result of which are the food supply committee and the council of defense.

Business in 1917 was very active, owing largely to the fact that in Connecticut was manufactured a great part of the munitions needed by the government. This accounted alike for the growth in population of the cities and the income of the State. Estimates show the size and growth of several cities as follows:

Cities	Est. Pop.	Growth since 1910
New Haven .....	161,817	28,212
Bridgeport .....	152,524	50,570
Hartford .....	129,353	30,484
Waterbury .....	101,680	28,519
Stamford .....	58,440	14,524

Many factories were made over for war uses, the skilled labor of the State had abundant work at high wages, and there were no serious disturbances. The patriotism of the people was suggested by the fact that at each sale of Liberty bonds Connecticut subscriptions exceeded the quota set for the State, and at the second call this was the only New England State to go above its limit. In the effort to raise \$100,000,000 for the Red Cross, the quota set for this State was \$1,500,000 and the subscriptions were practically \$2,500,000. To the Y. M. C. A. subscription there were in the State 123,797 contributors. The amount set against the State was \$800,000 and the amount raised was \$1,393,633.

At the close of the fiscal year, 1914, the net debt of the State was \$10,961,272. At the close of 1917 it had been reduced to \$2,607,979. The sinking fund stands at \$4,015,337.10, of which \$2,300,000 has been invested in Liberty bonds. The revised taxation, established since Holcomb became governor, brought in last year the following large sums: Tax on corporation profits, \$3,255,898; on the towns, \$1,749,025; on steam railroads, \$1,684,849; on street railroads, \$749,142; automobile licenses, etc., \$1,059,066; inheritances, \$1,050,987. Among the large payments were \$2,517,530 for highways, \$1,213,739 for humane institutions, \$1,103,383 for schools, \$416,000 for state bonds, and for sinking fund—\$3,500,000.

The State had 8917 men in camp under the first conscription, and a record of about 4000 volunteers. From April 1 to the end of December there were 2388 enlistments in the U. S. Navy. The militia consisted of 241 officers and 6652 in the ranks, and, as noted, in the home guard 20,000 men above military age.

Governor Holcomb appointed two members of the Supreme Court of the State and five of the superior court. Justice J. M. Thayer reached 70 years, and was succeeded by the promotion of Judge M. A. Shumway from the superior court. As he was soon to reach the age of 70 his successor was announced before the end of the year in the person of Judge E. B. Gager. Judges Shumway, Gager, W. L. Bennett of New Haven, W. H. Williams of Derby, and Joseph P. Tuttle of Hartford retired from the superior bench and were succeeded by Donald T. Warner of Salisbury, Frank D. Haines of Middletown, John P. Kellogg of Waterbury, John E. Keeler of Stamford, and W. M. Maltbie of Granby.

Municipal elections in various cities resulted in the election of Republican mayors in Bridge-

port, Putnam (succeeding a Democrat), Rockville, Waterbury (succeeding a Democrat), and Willimantic (succeeding a Democrat); and Democratic mayors in Bristol, Danbury, Meriden, Norwalk, and New Haven. The last two cities chose Democrats to succeed Republicans. In the voting in the fall on the question of license, two towns went from "dry" to "wet," and 11 from "wet" to "dry," leaving the situation 100 dry, and 68 towns wet. All the large cities are "wet."

**LEGISLATION.** Among the more important measures passed by the legislative session of 1917 are those noted below.

Laws relating to the administration of justice were amended, especially those relating to the employment of councils. Provision was made for the purchase and sale of food by designated officials. Measures were also passed regulating the details of the manufacture, storage, and handling of explosives. A proposed constitutional amendment granting woman suffrage was referred to the legislature of 1919. The hours of labor for women in certain employments were fixed at 58 per week. Persons detained more than five minutes at a railroad crossing are entitled to recover \$25 from the railroad. The approval of the secretary of the State Board of Charities is required before solicits for the support of any religious or charitable cause may be made. Provision was made for health and old age insurance in employments relating to labor and agriculture. The banking laws of the State were amended in important details. Provision was made for a teachers' retirement system and several other measures relating to education were passed. Provision was made for the combination of schools and school districts in connection with the needs of the communities affected. See **PENODOGY**.

**STATE OFFICERS.** Governor, Marcus H. Holcomb; Lieutenant-Governor, Clifford B. Wilson; Secretary of State, Frederick L. Perry; Treasurer, Frederick S. Chamberlain; Comptroller, Morris C. Webster; Attorney-General, George E. Hinman; Adjutant-General, Brig. Gen. George M. Cole; Commissioner of Insurance, Burton Mansfield—all Republicans except Mansfield and Bennett, not stated.

**JUDICIARY.** Supreme Court: Chief Justice, Samuel O. Prentice; Associate Justices, George W. Wheeler, John M. Thayer, Alberto T. Roraback, John K. Beach; Clerk, Geo. A. Conant.

**CONNOR, SELDEN.** An American soldier and public official, died July 9, 1917, at Augusta, Me. He was born at Fairfield, Me., January 25, 1839, and graduated at Tufts College in 1859. He enlisted in the First Vermont Infantry after the beginning of the Civil War, became lieutenant colonel of the Seventh Maine Infantry in August, 1861, and in January, 1864, was promoted colonel of the Nineteenth Maine Infantry. On June 11, 1864, he was made a brigadier general of volunteers. He took part in the Battle of the Wilderness, where he was wounded, and in the early part of 1866 he was honorably mustered out. In 1869 he was appointed assessor of internal revenue; was Governor of Maine, 1876-78; United States Pension Agent in 1882-86; and in 1897-1914. In 1890 Gen. Connor was president of the Society of the Army of the Potomac. On October 3, 1889, he delivered the oration at the dedication of the Maine monuments at Gettysburg.

**CONSCRIPTION.** See CANADA; MILITARY PROGRESS; UNITED STATES; UNITED STATES AND THE WAR.

**CONSERVATION OF NATURAL RESOURCES.** See DRAINAGE; FORESTRY; IRRIGATION.

**CONSULAR SERVICE.** See UNITED STATES.

**CONSUMPTION.** See TUBERCULOSIS.

**CONTAGIOUS DISEASES.** See VITAL STATISTICS.

**CONVICT LABOR.** See PENODOGY.

**COÖPERATION.** The war greatly stimulated the development of coöperation especially the formation of coöperative buying associations, throughout the world. In the United States the coöperative movement took a great variety of forms ranging from the coöperative purchase of expensive machinery and live stock by farmers to the formation of small local coöperative clubs in cities for the purchase of milk, coal or some other important article. Among farmers, both coöperative buying and selling had grown rapidly, especially among the growers of articles the favorable production of which was somewhat localized, as among tobacco growers in Virginia and Kentucky, potato growers of Maine and Virginia, onion growers of Texas, citrus fruit growers of Florida and California, and apple growers of Oregon. Two developments of 1917 were especially noteworthy. One was the development of coöperative associations among the employees of corporations. Thus the employees of the Hot Point Electrical Heating Company of Ontario, Cal., formed an association comprising 500 members for the running of a coöperative store. Space, equipment, light, heat, and janitor service were furnished by the company. Orders by members were made on special blanks and deposited in a designated box in the morning. The storekeeper filled these orders, goods being carried home by the employees at noon or in the evening. Goods were sold at 10 per cent above wholesale price; the saving was estimated at 15 per cent.

Another development was the growing interest of trade unions in the possibilities of coöperation. The American Federation of Labor (q.v.) at its annual convention and various local unions strongly approved the coöperative movement. The United Mine Workers of America actively stimulated the formation of coöperative stores among miners. Thirty-one stores had been organized by January, 1917, on the Rochdale plan. The miners also had organized coöperative medical service and in one instance a hospital had been erected at the cost of \$50,000.

**FEDERATION.** There were numerous evidences of a tendency toward the federation of coöperative societies and the imminent prospect of the formation of a wholesale coöperation society in America. Under the lead of the Coöperative League of America a convention of Eastern States Coöperative Societies was held in New York on November 24. A more important convention was held in October at Staunton, Ill., attended by managers and officers of at least 100 coöperative retail societies. They met in a coöperatively owned labor temple; representatives were present from the Central States Coöperative Society, Finnish societies in Michigan, farmers of the Northwest, and miners' organizations of West Virginia and Iowa, besides the Coöperative League of America which has headquarters in New York City. Steps were

taken toward the development of relationships between United States and Canadian societies and the consolidation of efforts toward a wholesale society.

**UNITED KINGDOM.** The number of coöperative retail societies in Great Britain and Ireland somewhat exceeded 1500 with a total membership of over three million families. They included fully one-fourth of the entire population. They are grouped under three wholesale societies, English, Scottish, and Irish. These wholesale societies have so extended their activities that they handle many articles from the earliest processes of production to the consumer. They own steamship lines, tea lands in Ceylon, olive groves in Africa, currant establishments in Greece, and raisin plants in Spain. They manufacture numerous articles such as soap, shoes, textiles, jams and preserves, flour, bread and bakery products, and many others. The increasing cost of living due to the war greatly increased the reliance upon their activities. Especially interesting was the very marked increase in the interest of trade unions in the advantages of coöperative buying. For the second quarter of 1917, according to the *Labor Gazette*, the total transactions of all three wholesale societies in both distributive and productive departments aggregated £26,916,729 (\$134,000,000). The distributive departments sold in these three months more than \$100,000,000 worth of goods. This was an increase of 22.2 per cent over the same quarter of 1916 and of 123 per cent over the same quarter of 1912. The productive departments showed an increase of 31 per cent over 1916 and of 163.7 per cent over 1912.

The English Coöperative Wholesale Society began in November, 1916, the publication of the *Monthly Producer*. The Coöperative Union began in January, 1917, the publication of the *Co-operative Educator*, to serve as a link among the voluntary teachers of coöperation and to provide study circles with appropriate material. In Ireland the coöperative movement had extended much beyond retailing and had become the keynote for the reorganization of agricultural life and peasant opportunities. The Coöperative Reference Library at Dublin has in consequence grown rapidly and collects material of interest from all countries. The annual Co-operative Congress of which the 49th session was held in June, 1917, publishes an elaborate report, that of 1916 comprising nearly a thousand pages. See AGRICULTURAL CREDIT; also paragraph on *Credit Unions* under REMEDIAL LOANS.

**JAPAN.** The development of coöperating societies in Japan in the last decade has been truly remarkable. On January 1, 1907, there were a total of 2470 coöperative societies in that country, but on January 1, 1916, there were 11,509. Thus of credit associations there were 1202 on the earlier date and 3015 on the later. Societies engaged in coöperative selling grew from 126 to 234; purchasing societies increased from 446 to 535; credit and purchase societies increased from 41 to 2582; credit sale and purchase societies increased from 24 to 2609; and credit sale, purchase, and productive associations grew from 5 to 946. The only type of society that had failed to increase decisively in number was that combining purchasing and production.

**COPPER.** The copper production in the

United States in 1916, surpassed all previous records, according to the United States Geological Survey. The average price (i.e., *actual* not *quoted* price) during the year was \$0.246 a pound, and at this price the output for the year had the value of \$474,288,000 compared with \$242,902,000 for the output in 1915. The output of blister and regular copper from domestic ores was 1,928,000,000 pounds in 1916 compared with 1,388,000,000 pounds in 1915. The output of refined copper from primary sources, domestic and foreign, for the year 1916 was 2,259,000,000 pounds compared with 1,634,000,000 pounds in 1915. The production of copper from the mines in 1916 was more than double that of 10 years previous, and more than four times that of 20 years previous. The profit resulting from the domestic production was far greater in 1916 than in any previous year or in 1917. It probably exceeded \$300,000,000.

At the beginning of 1916 there were about 82,400,000 pounds of refined copper in stock in the United States. This quantity added to the refinery production gave the total available supply of about 2,341,000,000 pounds of refined copper. Deducting from this the exports for the year, domestic consumption was materially greater than the 1,043,000,000 pounds in 1915, being 1,430,000,000 in 1916. The average price in copper in 1916 (0.246 per pound) showed a marked increase over that of the preceding year (\$0.175).

The imports of unmanufactured copper of all forms for the first 10 months of 1917 amounted to 460,780,000 pounds, as against 397,594,000 pounds for the first 10 months of 1916. The imports for the year 1916 were 462,335,000 pounds.

The exports of pigs, ingots, bars, plates, sheets, rods, wire, and like copper products for the first 10 months of 1917 amounted to 953,876,000 pounds; the exports for the first 10 months of 1916 were 655,473,000 pounds.

**1917 PRODUCTION.** The production of copper in 1917 was slightly less than in 1916, according to the preliminary figures and estimates of the United States Geological Survey, from all plants that make blister copper from domestic ores or that produce refined copper. At an average price of 27 cents a pound the output for 1917 had a value of \$510,000,000, as against values of \$475,000,000 for 1916 and \$190,000,000 for 1913. The figures showing the smelter production from domestic ores represent the actual output of most of the companies for 11 months and the estimated output for December. The production of blister and Lake copper from domestic ores was 1,890,000,000 pounds in 1917, against 1,928,000,000 pounds in 1916 and 1,224,000,000 pounds in 1913.

The output of refined copper (electrolytic, Lake, casting, and pig) from primary sources, domestic and foreign, for 1917, was estimated at 2,362,000,000 pounds, compared with 2,259,000,000 pounds for 1916 and 1,615,000,000 pounds for 1913.

At the beginning of 1917 about 128,000,000 pounds of refined copper were in stock in the United States. By adding this quantity to the refinery output of the year it will be seen that the total available supply of refined copper, exclusive of secondary copper, was about 2,490,000,000 pounds. By subtracting from this quantity the exports for the first ten months and

the estimated exports for the last two months, and assuming no change in stocks, it will be seen that the supply available for domestic consumption in 1917 was materially less than the 1,430,000,000 pounds available in 1916.

The actual production in 1917 excluding casting copper, was a little less than 2,300,000,000 pounds. In other words the United States at the end of 1917, possessed adequate capacity for refining for all needs provided it could be worked at maximum efficiency, a condition which on account of labor and other difficulties was practically impossible of realization at the time.

**PRODUCTION BY STATES.** Arizona produced 687,800,000 pounds, a slight decrease from the production in 1916, which was 694,800,000 pounds. Montana produced 278,000,000 pounds as against 352,000,000 pounds in 1916. Michigan produced 275,000,000 pounds, an increase over the 269,794,000 pounds produced in 1916. Utah produced 245,000,000 pounds, as compared with 232,000,000 pounds in 1916. Nevada produced 110,000,000 pounds, an increase over the 100,000,000 pounds produced in 1916. Alaska, with a production of about 87,500,000 pounds, showed a large decrease from the previous year. New Mexico increased its production to 104,500,000 pounds from 79,800,000 pounds in 1916. The production of California was considerably above the 43,400,000 pounds produced in 1916. The production in Tennessee did not differ greatly from the production in 1916, which was 14,500,000 pounds.

**IMPORTS AND EXPORTS.** The imports of all forms of unmanufactured copper for 1916 amounted to 462,336,000 pounds. This compared with an import of 315,698,000 in 1915. The exports of copper in all forms for 1916 amounted to 784,006,000 pounds. The exports for the 12 months of 1915 were 681,918,000 pounds.

**WORLD'S PRODUCTION.** *The Engineering and Mining Journal* in its annual statistical summary presented the accompanying table of world's production of copper in 1917 which showed a material increase, but nothing in comparison to that for 1916 over 1915. Japan, however, was a noteworthy source of increased copper supply, as were also Canada, Australia, Peru, Chile, Japan, and Africa.

#### THE WORLD'S PRODUCTION OF COPPER

(In metric tons—2204 lbs.)

Country	1914	1915	1916	1917
United States	525,529	646,212	881,287	856,570
Mexico	36,887	80,969	55,128	43,827
Canada	84,027	47,202	47,985	50,351
Cuba	6,251	8,886	7,816	9,622
Australasia	37,592	32,512	35,000	38,100
Peru	27,080	32,410	41,625	45,620
Chile	40,867	47,142	64,638	75,345
Bolivia	1,306	3,000	4,000	4,000
Japan	71,048	76,039	101,467	124,306
Russia	32,262	25,881	20,887	16,000
Germany	30,480	35,000	45,000	45,000
Africa	24,678	27,377	34,572	37,315
Spain and Portugal	37,099	46,200	42,000	42,000
Other countries	25,176	25,000	25,000	25,000
Totals	929,649	1,083,730	1,406,353	1,413,056

**TRADE CONDITIONS.** The trade conditions in the copper market varied during the year. The average price in New York was 27.180 cents per pound, starting in January with a price of 28¾ cents and increasing until in March, a maximum of 37 cents was secured.

On March 21, it was announced that the copper producers had agreed to furnish the United States government with about 45,000,000 pounds of copper at 16½ cents for deliveries extending 12 months from April 1. From the time of the entrance of the United States into the war, the copper situation was complicated, and there was a decrease in prices. In June, there was a serious strike at Anaconda, and Secretary of the Navy Daniels stated that he intended to leave the price of copper for government requirements to be determined by the Federal Trade Commission. The action of the government was uncertain during the summer, and the fact that a large contract which had been negotiated with a foreign government in previous years had been filled, also complicated the situation. In July and August, there were strikes in Montana and Arizona which seriously curtailed the production and the refinery at Great Falls was closed. (See STRIKES.) The Federal Trade Commission was examining the books of the producers to find out the actual cost of production and the price to the government was in dispute in various quarters. The War Industries Board had agreed to advance a price to the copper producers of 22½ cents, leaving the difference between that price and 25 cents to be settled after the Federal Trade Commission had reported. The government was receiving adequate supplies of copper, but payment was deferred to a future basis of adjustment, so that the government was owing the producers about \$10,000,000. Towards the end of the summer, the supplies of crude copper were diminishing with the suspension of operations in the mines, and the Anaconda Company closed its Washoe and Great Falls plants while the Raritan refinery in New Jersey and others were running at considerably less than full capacity. On September 6, the War Industries Board bought about 77,000,000 pounds of copper for the Allies which advanced the market, and finally the price of 23½ cents was fixed by agreement of the War Industries Board and the copper producers.

The Copper Producers' Committee was organized to administer the control and distribution of the industry, the actual business being done through the United Metals Selling Company dealing with the United States government, and the American Smelting and Refining Company which dealt with foreign countries, thus being the clearing-house for the business. With the march of events conditions in the copper industry improved, especially as manufacturers did not demand exorbitant stocks, and in December the government and producers were again in conference respecting the continuation of the agreement made on September 21 for four months further, but no conclusion was reached. With a large demand for copper, the costs of production under unfavorable circumstances naturally set the price, and while copper was demanded, there were a number of producers who believed that they were unable to produce at the price set by the government in its various conferences. See STRIKES.

**CORN (MAIZE).** The world's average annual production of corn in normal times is about 3,825,000,000 bushels. During the eight years ending 1917 the 4-billion bushel mark was surpassed three times, and taking the heavy crop of the United States in 1917 into considera-

tion and, further, that over 70 per cent of the world's crop is produced there, complete data, if available, would probably have shown another 4-billion bushel yield. According to provisional figures published by the International Institute of Agriculture, Rome, seven countries in the northern hemisphere produced 3,314,344,000 bushels, or 22.7 per cent more than in 1916. In this estimate Austria-Hungary, Mexico, and Rumania, which in normal times produce about 6 per cent, 5 per cent, and 3 per cent of the world's crop, respectively, were not included. The yield of Italy was placed at 86,680,000 bushels and that of Spain at 27,580,000 bushels. The Italian crop was estimated by other authorities as about 30,000,000 bushels short of meeting the requirements of the country. The Canadian crop was estimated at 6,193,000 bushels, valued at \$7,000,000, and in addition corn grown for fodder was valued at \$10,000,000. The corn grown for grain was only about one-half the usual yield.

As estimated by the Department of Agriculture, the United States produced 3,159,494,000 bushels on 119,755,000 acres, both production and acreage never having been surpassed. The average yield per acre was 26.4 bushels as compared with 24.4 bushels the year before and with 26.1 bushels as the average for the five years 1911-15. The average farm value of corn on December 1, 1917, was reported at \$1.28 per bushel, as against 88.9 cents December 1, 1916. The total value of the crop on this basis was \$4,053,672,000, or greater by \$1,772,943,000 than the value of the crop of 1916 and by \$2,409,161,000 than the average value for the five-year period 1911-15. Although a record crop was produced heavy losses were sustained as the result of a late cold spring, a cold and dry summer in the greater part of the corn States west of the Mississippi, a protracted drouth in the southern plains region, and frosts beginning about September 10 and extending over large areas of the corn belt. The total loss from frost damages was estimated at 14 per cent as to yield and at 21 per cent as to quality. As the result large quantities of corn remained soft and could not be cribbed but had to be used for feeding direct from the field. The loss was mitigated to a large extent by the fact that owing to the lack of old corn it was necessary to draw on the new crop and that much of the frosted corn was cut and placed in the silo.

A study made by the Department of Agriculture of the 1915 and 1916 crops showed that in round numbers from 41 to 43 per cent of these crops consisted of white corn, approximately 43 per cent of yellow, and 14.5 to 16 per cent of mixed corn. White corn preponderated in the South and yellow in the North. It was also brought out in this connection that in the South white corn sells for about 3 cents a bushel higher than yellow corn, while in the North there is practically no difference in price. Mixed corn sells for about 2 cents a bushel less than yellow in the North and nearly 4 cents below white in the South.

In common with other cereals, corn was subject to export regulations in practically all countries of the world. In the European belligerent countries and their dependencies the export of corn and corn products was either prohibited or so regulated that the supplies were assured to them or their allies. In many coun-

tries the prices were fixed officially for requisition by governments and also for ordinary transactions. Ocean freight rates reached a record height. The rate from New York to Liverpool in November, 1917, was \$40.07 per metric ton (2204 pounds), as compared with \$18.84 in 1916 and \$2.115 in 1913. From Buenos Aires to Great Britain the November, 1917, rate was \$30.53 and from Kurrachee, India, to Great Britain \$69.48 per metric ton.

**CORNELL UNIVERSITY.** A non-sectarian institution for higher education, at Ithaca, N. Y. On November 1, 1917, there were enrolled in all departments (excluding duplicates) 3859 students; there were 750 members of the faculty. The voluntary enlistment or conscription of students caused a diminution of about 30 per cent of the normal enrollment. The library contained 489,656 volumes. Productive funds at the end of the fiscal year 1917 amounted to \$15,198,968 and the annual income therefrom to \$736,904. In addition the New York State College of Agriculture received \$638,187 and the New York State Veterinary College, \$70,861 from the State of New York. In 1917 occurred the deaths of Charles L. Crandall, Professor Emeritus of Railway Engineering and Geodesy; George W. Harris, Librarian emeritus; and Henry A. Sill, Professor of Ancient History. Notable gifts received during the year were \$500,000 from Col. Oliver H. Payne of New York for the Medical College; \$54,000 from the Cornell Alumni Fund for the general support of the University; \$50,000 from George F. Baker of New York to complete his gift of \$350,000 for residential halls. In May, 1917, was established a United States School of Military Aeronautics and in the fall of the year the university turned over to that school the New York State Drill Hall, a building erected on the campus by the State of New York for the University's department of Military Science and Tactics and just completed at a cost of \$350,000. President, Jacob Gould Schurman, LL.D., Sc.D.

**CORPORATIONS.** See TAXATION; TRUSTS.

**CORPORATION TAX.** See TAXATION.

**CORRECTION.** For matters connected with this subject see CHARITIES.

**COSTA RICA.** A Central American republic between Nicaragua and Panama. It borders the Caribbean Sea on the east and the Pacific Ocean on the west and south. Capital, San José.

**AREA AND POPULATION.** The estimated area is 18,691 square miles, which is about equivalent to the combined areas of New Hampshire and Vermont. The population as calculated for December 31, 1915, was 430,701, distributed by provinces as follows: San José, 131,332; Alajuela, 101,783; Cartago, 64,659; Heredia, 46,162; Guanacaste, 40,806; Limón, 23,756; Puntarenas, 22,203. The white inhabitants dwell mostly in the larger towns. On the banana plantations, mostly in Limón province, are some 18,000 colored British West Indians. Estimated population of the city of San José, about 35,000 (with suburbs, 47,500); Cartago, 12,900; Heredia, 8200; Limón, 7000; Puntarenas, 5000; Liberia, 2500. Marriages in 1914 and 1915 respectively, 2178 and 1929; births, 18,633 and 18,700; deaths, 9482 and 9445; immigration, 8995 and 3886; migration, 8908 and 4860.

**EDUCATION.** Elementary instruction is free and nominally compulsory. In 1915, elementary schools numbered 419, with 1489 teachers and

34,703 pupils enrolled; average attendance, 32,059. There are a few institutions for secondary and for professional education. In 1915 a normal school was established at Heredia and has already won an excellent reputation. Roman Catholicism is the state religion, but liberty of conscience and worship prevails.

**PRODUCTION.** Costa Rica's leading crops commercially are bananas and coffee. Its banana industry, along the east coast, has developed rapidly and in 1917 surpassed that of the other Central American countries, producing annually upwards of 11,000,000 bunches, mostly exported to New Orleans, Mobile, New York, and Boston. Costa Rican coffee is prized for its quality; the export in 1914-15 was 12,206 metric tons and in 1915-16, 16,844 metric tons. Cacao and sugar cane are valuable crops; other crops, of local importance, are corn, beans, potatoes, and rice. Cattle raising is a profitable industry, especially in the west and in the districts adjoining Nicaragua. The number of cattle in 1915 was about 337,000. There are large quantities of cedar, rosewood, mahogany, and other cabinet woods, but this exploitation is little developed. There is some mining of manganese, silver, and especially gold.

**COMMERCE.** The reported value of imports in 1915 was \$4,478,782, and of exports \$9,971,582; in 1916, \$6,731,273, and \$11,121,172. Leading imports are cotton goods, wheat, flour, lard, drugs, rice, and coal. The reported value of the bananas exported in 1914 was 10,162,912 colones, and in 1915, 9,521,648 colones (the colon represents about 47 cents); coffee, 10,028,731 and 8,022,166; gold and silver in bars, 1,910,965 and 1,733,111; cacao, 181,736 and 375,934. Trade by countries, in thousands of dollars:

	Imports		Exports	
	1915	1916	1915	1916
United States .....	3,082	4,677	4,917	6,881
United Kingdom.....	549	791	4,438	3,668
Spain .....	119	163		
France .....	84	180	68	98
Total, incl. others..	4,479	6,731	9,972	11,121

**COMMUNICATIONS.** The total length of railway in operation, as reported in 1916, is 431 miles (693 kilometres), including branches and sidings. The main line extends from Limón, on the Caribbean, to San José, a distance of 103 miles, and San José is connected with the Pacific port of Puntarenas by a line 69 miles long. In Costa Rica, a project for the construction of a railway from Alajuela to Grecia, a distance of about 16 miles was under discussion in 1917. A proposition of P. W. Chamberlain an American engineer, was to put down a 30-inch gauge track, making foundation on that basis, with an agreement to change to a 42-inch gauge after 20 years. The government desired the foundation to be made at once for a 42-inch gauge, although conceding the use of the narrow gauge for 20 years. The concession was to be for 99 years, the government agreeing to advance bonds for \$3000 American gold per mile, or a total of \$75,000, secured by direct tax on the region benefited. The contract was subject to the approval of Congress which would meet in regular session in May, 1918. The railroad would require additional equipment as follows: Three 12-ton locomotives, twenty-five 8-ton freight cars, enough 20-pound rails for 15 kilometres

(9 miles), telegraph and telephone supplies, and other necessary equipment.

Telegraph lines aggregate over 1500 miles; offices, 147. There are two radiotelegraph stations. Post offices, 208.

**FINANCE.** The standard of value is gold. The monetary unit is the colon; its par value is 46.536 cents. Revenue and expenditure, in thousands of colones (figures for 1916 and 1917 are budget estimates):

	1918	1918	1914	1915	1916	1917
Rev. ....	9,951	9,613	8,602	6,834	7,563	7,485
Exp. ....	9,311	10,184	9,742	9,156	8,982	9,068

Principal estimated receipts for 1917: customs, 3,711,000 colones; liquors, 2,000,000; Pacific Railway, 838,000; telegraphs, 294,000; export duty on bananas, 210,000. Larger departmental disbursements, as estimated for 1917: treasury and commerce, 3,504,670 colones; public instruction, 1,319,887; fomento, 1,227,355; war, 1,136,104; interior, 1,027,896; justice, 316,620.

Public debt as reported outstanding December 31, 1915; foreign, 35,302,033 colones; internal, 3,186,069; floating, 6,618,295; total, 45,106,398.

**GOVERNMENT.** A new constitution was promulgated July 13, 1917. It provides that the president and vice-president shall be chosen for six years by an electoral college consisting of both houses of the Congress, representatives of municipalities, ex-presidents of the republic, judges, and cabinet officers. On May 8, 1914, Alfredo González Flores was inaugurated president for four years in succession to Ricardo Jiménez.

**HISTORY.** The president, González Flores, whose course had aroused much opposition in the country was finally deposed on January 27 by the military forces at the capital. The revolution according to its leaders resulted from the design of the president to secure his reelection. It was said to be his endeavor to retain his position for another term contrary to the constitution. A further grievance alleged against him was his threat to introduce a new system of taxes to which the people were opposed. The deposition was effected without disorder and the president was not molested. He took refuge in the American legation. He had been chosen president by Congress in May, 1914. After his overthrow a provisional chief executive was created in the person of minister of war, Federico Tinoco Granados, and a provisional cabinet was appointed. On April 11 he was elected president. On February 21 the American minister at Costa Rica declared that the government of the United States had regarded this change with grave concern and believed that any legal acts of this nature would disturb the peace of Central America; it therefore declared that it would not give recognition or support to any government that was established unless it proved that it had been elected by legal and constitutional means. Toward the end of May alleged proofs of a conspiracy between German agents and former president González were made public. Meanwhile on April 12 the Costa Rican government had placed its waters and ports at the disposal of the United States for war purposes. On April 26 it canceled the letters patent of all Germans in its consular service. By this time also it had organized a

guard service along the coasts and boundaries as a protection against German activities.

#### COST OF LIVING. See PRICES.

**COTTMAN, VINCEDON L.** He died at Washington, March 15, 1917. He was born at Riverside, La., Feb. 13, 1852. He entered the academy at Annapolis from New York in 1868 and was graduated in 1872. He served in the Spanish-American War as a lieutenant on the *Alert* and *Brutus*, and was promoted to be captain in 1907. In the same year he was made commander of the armored cruiser, *California*. He was promoted to be rear admiral in 1910.

**COTTON.** On December 11, 1917, the Bureau of Crop Estimates of the United States Department of Agriculture estimated the 1917 cotton crop of the United States, exclusive of linters, at 10,949,000 bales of 500 pounds each, a reduction of about 5 per cent from the crop of 1916. The estimate of the International Institute of Agriculture at Rome on November 17, 1917, was for a crop in the United States of 12,046,800 bales. Other estimates of about 13,000,000 bales, including linters, were made. All these estimates were below the 5 year average production as reported by the Bureau of the Census.

The area planted to cotton in 1917 was about 4 per cent less than in 1916. A preliminary estimate of the Bureau of Crop Estimates made early in October indicated a crop of 12,000,000 bales, but this yield was materially reduced by reason of heavy early frosts and other unfavorable conditions over much of the cotton producing area. While the crop was below the average, its money value would probably exceed that of any previous crop as the average price of lint cotton to the producer on December 1, 1917, was 27.7 cents per pound as compared with 19.6 cents on the same date in 1916 and 11.5 cents in 1915.

According to the Bureau of the Census, there had been ginned prior to January 1, 1918, 10,450,401 running bales, exclusive of linters. This total includes 184,510 round bales, which are counted as half bales, and 86,813 bales of Sea Island cotton. Consular and other reports estimate the 1917 Egyptian crop at about 1,237,000 bales of 500 pounds each, and the crop of India at 3,418,000 bales. No definite estimates of the crops in other countries were available at the end of the war.

The cotton crop of the United States for 1916, estimated crop for 1917, and amount reported ginned by January 1, 1918, exclusive of linters, by States were:

States	Crop, 1916		Estimated crop, 1917	Reported ginned, Jan. 1, 1918 Running bales
	500 pound bales	500 pound bales		
United States..	11,449,930	10,949,000		10,450,401
Alabama .....	533,402	505,000		483,018
Arkansas .....	1,134,033	895,000		858,445
California .....	43,620	67,000		37,265
Florida .....	41,449	40,000		46,353
Georgia .....	1,820,939	1,820,000		1,768,280
Louisiana .....	443,182	615,000		605,937
Mississippi .....	811,794	895,000		809,712
Missouri .....	62,699	51,000		44,789
North Carolina..	654,603	570,000		543,523
Oklahoma .....	823,526	890,000		884,829
South Carolina..	931,830	1,235,000		1,146,226
Tennessee .....	382,422	206,000		200,320
Texas .....	3,725,700	3,115,000		2,987,947
Virginia .....	27,127	16,000		16,273
All other States	13,604	29,000		17,536

Of the States listed as all others, Arizona, New Mexico, Kansas, and Kentucky contributed to the production, Arizona having reported as ginned 13,748 bales, most of which was Egyptian cotton. The figures given for California in the above table include small amounts of cotton from Mexico, especially from Lower California.

The final report of the Bureau of the Census on the cotton crop of the United States for 1916 was 11,449,930 bales of 500 pounds each, to which there should be added 1,330,714 bales of linters. The Sea Island cotton production for 1916 was 117,559 bales produced as follows: Florida, 36,092; Georgia, 77,981; and South Carolina, 3486 bales. The Sea Island bales ginned up to December 31, 1917, were 86,813 as follows: Florida, 86,100; Georgia, 44,748, and South Carolina, 5946. For the cotton year ending July 31, 1917, there was crushed 4,473,930 tons of cotton seed which yielded 1,403,979,199 pounds of crude oil and 2,222,688 tons of cottonseed cake and meal, besides other products. During the calendar year 1916 cotton fibre, linters, and hull fibre equivalent to 898,000 bales were consumed in the United States in the manufacture of explosives, and for the quarter ending March 31, 1917, 257,000 bales were so used.

The total exports of domestic cotton from this country for the year ending June 30, 1917, were 5,947,165 bales. The imports for the same period amounted to 294,123 bales of 500 pounds each. The principal importations were from Egypt, 177,545; Asia, 37,436; and Peru, 11,771 bales.

The world's production of commercial cotton, exclusive of linters, in 1916 was, according to the Bureau of the Census, 18,365,000 bales. Shepperson estimated the world's production in 1917, including the linters of the United States crop, at 21,514,000 bales. The contributions of the leading countries to the mill supply of the world for 1915 and 1916 were:

Country	1916		1915	
	500 pound bales		500 pound bales	
United States.....	12,778,000		10,709,000	
India .....	3,418,000		2,695,000	
Egypt .....	990,000		963,000	
China .....	2,500,000		1,800,000	
Russia .....	1,085,000		1,435,000	
Brazil .....	320,000		250,000	
Mexico .....	70,000		125,000	
Peru .....	130,000		93,000	
Persia .....	50,000		130,000	
Turkey .....	60,000		100,000	
All other countries..	830,000		850,000	

The world's consumption of cotton, exclusive of linters, for the year ending July 31, 1917, was, according to the Bureau of the Census, approximately 20,180,000 bales of 500 pounds net. The total number of consuming spindles was estimated at 150,000,000, of which about 33,400,000 were active in the United States during the year, 19,300,000 in northern States and 14,076,000 in the cotton producing States.

Data regarding cotton growing and handling in countries other than the United States were rather meagre at the end of 1917 owing to the disturbed conditions due to the war. In Great Britain a Cotton Control Board was appointed to regulate the transportation and utilization of cotton. A Committee on Cotton Research was established, with headquarters at Manchester, England, which would investigate problems connected with the production and manufacture of

cotton. The exportation of Sea Island cotton from the British West Indies was prohibited, the government taking over the crop at prices ranging from 72 cents to \$1.00 per pound. On December 7 an embargo was placed on the shipment of cotton from Egypt except on license.

The British Cotton Growing Association announced that the Government Grant having been withdrawn, it would be impossible for the Association to undertake any further developments. In 1916 there were grown 78,800 bales of cotton (400 pounds each) in countries where the industry had been fostered by the Association. The situation in Africa, aside from Egypt, was said to be very unsatisfactory due largely to lack of transportation. The production for 1917 was not expected to be much below that of 1916.

The Russian Ministry of Agriculture reported the cultivation of *Gossypium herbaceum* was diminishing and *G. hirsutum* increasing in Russian Central Asia. The cotton crop of China for 1915 was said to have been more than 1,000,000 bales and that of 1916 was much greater. Watering of cotton was still practiced to some extent in spite of regulations to the contrary. An allotment of \$17,500 was made for cotton improvement work in Madras in 1916-17. A cotton experiment station was established in the state of Maranhao, Brazil. A plan for the commercial grading of Brazilian cottons was proposed. A shipment of over 78,000 pounds of long staple cotton to New York from Pernambuco was reported. The pink bollworm (*Gelechia gossypiella*) has appeared in the northern cotton district of Brazil.

The exports of cotton from Peru amounted in 1916 to over 24,000 metric tons, about 4000 of which was Aspero cotton used for imitation woolen cloth. Cauto cotton, a perennial species from Honduras, has been introduced into Jamaica, where the yield is said to be high. The fibre is reported to resemble Rough Peruvian. In Queensland 4 cents a pound for seed cotton is guaranteed for the crop of 1917 and 2 succeeding crops. In 1916, with an advance of 3.5 cents, a final price of a little more than 5 cents a pound for seed cotton was obtained.

In the United States a license was required for the exportation of cotton under the Export License Proclamation of August 27, 1917. An important reason for this restriction was the large increase of cotton shipments to six of the leading neutral countries of Europe. These countries received from the United States 387,922 bales of cotton in 1914, 1,845,571 in 1915, and 609,589 in 1916. The average mill consumption of these countries for the 5 year period to August 31, 1913, was 633,200 bales.

The cotton boll weevil advanced into South Carolina during the summer of 1917, and it spread over practically all the cotton growing region of Florida. It was said to have done much injury in Georgia, especially to Sea Island cotton. As a substitute for Sea Island cotton in regions where the boll weevil exists, experiments were in progress with an upland variety, Meade, which is said to be early, prolific, and its fibre little if any inferior to Georgia or Florida grown Sea Island cotton. One of the most serious menaces to cotton production in the United States is the presence in Texas of the pink bollworm. It was found near Hearne and Beaumont in the vicinity of mills which received

seed from Mexico in 1916. At these places the infected areas were quite small. In the Trinity Bay region it had spread for 100 miles along the shore, involving about 1000 acres of cotton. Energetic measures have been taken to stamp it out, Congress having appropriated \$250,000 for this purpose. For other diseases (see BORANY, *Plant Diseases*). A reorganized cotton weather service was established by the United States Weather Bureau with headquarters at New Orleans.

**COTTON BOLL WEEVIL.** See COTTON.

**COUNCIL OF NATIONAL DEFENSE.** See CHEMISTRY, INDUSTRIAL.

**COURLAND.** A government of Russia, one of the Baltic Provinces. It was incorporated with Russia at the third partition of Poland, in 1795. It borders the Baltic Sea and the Gulf of Riga and on the south is bounded by the government of Kovno. Area, 10,535 square miles; population, as estimated January 1, 1915, 812,300. The people are largely Germanic. The largest city is Libau (Libava), a seaport, which before the great war had an estimated population of 90,700; the capital is Mitau (Mitava), 48,800.

**COURTHOPE, WILLIAM JOHN.** An English scholar and poet, died at Wadhurst, April 10, 1917. Born in 1842 at South Malling, Sussex, he studied at Harrow and at New College, Oxford, where he took honors in classics and humanities, wrote the Newdigate prize poem in 1864 and won the Chancellor's prize for an English essay in 1868. For many years he was a civil service commissioner, retiring in 1907. From 1895 to 1901 he served as professor of poetry at Oxford. Professor Courthope was especially attracted to the poetry of the seventeenth and eighteenth centuries, and wrote much in this field, beside modeling his own verse largely on that of Pope and his contemporaries. He edited Pope's works and wrote a *Life* of him, and for the *English Men of Letters Series* a *Life of Addison*. He is best known for his monumental *History of English Literature* (6 vols., 1895-1909), but he published also *Ludibria Luna*, *The Paradise of Birds*, and *Life in Poetry, Law in Taste*. He was elected a fellow of the British Academy of Letters and the Royal Society of Literature, and honorary fellow of New College, Oxford, and received honorary degrees from Durham and Edinburgh.

**COURT TENNIS.** See RACQUETS AND COURT TENNIS.

**COWS.** See DAIRYING.

**CRAFTS, JAMES MASON.** A distinguished American chemist and educator, died at Ridgefield, Conn., June 20, 1917. He was born in Boston in 1839. After graduating in 1858 from the Lawrence Scientific School of Harvard University, he studied in Europe, at the Mining Academy of Freiberg, at Heidelberg, and at Paris, one of his teachers being Bunsen. He returned to the United States in 1865 to enter mining work, and was sent to Mexico to examine mines. By 1868, however, he had entered on his long teaching career as professor of chemistry and dean of the chemistry faculty at Cornell University. In 1871 he accepted the chair of chemistry at the Massachusetts Institute of Technology. This he held nominally till 1880, although in 1874 he received leave to go abroad for research work. He made various important inventions and discoveries, in organic chemis-

try, physics, and physical chemistry, the most notable of which, made in collaboration with Charles Friedel, the French chemist with whom he did much work, was a synthetic method for the production of new carbon compounds through the catalytic action of chloride of aluminum (*Arsenic Ethers, a Method of Synthesis by Means of Chloride of Aluminum*, 1879). He returned to the Massachusetts Institute of Technology to be professor of organic chemistry from 1892 to 1897 and president from 1898 to 1900, when he again resumed research work, in Boston. Beside the monograph named, Professor Crafts published a textbook of *Qualitative Chemical Analysis* (1869), and *Researches upon Silicic Compounds* (1865), *Studies in Thermometry* (1880), *Catalysis in Concentrated Solutions* (1908), and *Thermometry* (1913-15). In 1885 he received the Jecker prize of the French Academy of Sciences and was made chevalier of the Legion of Honor. He was also a member of the National Academy of Sciences and other leading American societies, corresponding member of the British Association, and honorary member of the Royal Institution of Great Britain. Harvard gave him the degree of LL.D.

**CRANDALLITE.** See MINERALOGY.

**CRANE, FRANK.** An American illustrator and cartoonist, one of the first art editors of a daily newspaper in the United States, died October 26, 1917, at New Rochelle, N. Y. He was born in Rahway, N. J., in 1856, graduated at the New York Academy of Design, became a cartoonist on the *New York World*, and later art editor of the *World* before photographic processes began to be used in the makeup of daily newspapers. He afterward became art editor of the *Philadelphia Press*, and then was successively cartoonist on the *New York Tribune*, Sunday art editor of the *New York Herald*, and connected with the art departments of the *New York Times* and the *Boston Herald*. He wrote stories for boys and the comic series "Willie Westinghouse Smith," "Uncle Dick's Contraptions," and "Muggsy." He was a cousin of Stephen Crane, the author.

**CRAWFORD, JOHN WALLACE (CAPTAIN JACK CRAWFORD).** An American scout, lecturer, and writer of prose and verse, died in Jamaica, N. Y., February 28, 1917. He was born in 1847 in County Donegal, Ireland, but as a boy came with his parents to the United States. Although under age, he managed to enlist in a Pennsylvania regiment and fought in the Civil War by the side of his father, who was killed in battle. The son was severely wounded. After the war he went west and as a government scout served in several famous Indian campaigns, notably as chief of scouts (succeeding "Buffalo Bill") under General Crook when Sitting Bull was captured, and under Custer. From 1886, when he retired from army life, Crawford was for long a ranchman and miner in New Mexico. Two years he spent in the Klondike. Latterly he had been known chiefly as a lecturer and as an author of verse, stories, and songs, collected as *The Poet Scout; Lariattees; and Whar the Hand o' God is Seen*. He also devoted himself to the cause of temperance, and claimed to have persuaded 25,000 boys and men, many of them convicts, to sign the pledge.

**CREDIT UNIONS.** See AGRICULTURAL CREDIT; REMEDIAL LOANS.

**CRESTMOREITE.** See MINERALOGY.

**CRETE (CANDIA).** An island in the Mediterranean Sea; an autonomous state under the suzerainty of Turkey until May 31, 1913, when it was ceded to the Balkan powers, which formally recognized its union with Greece by the treaty of Bucharest, August 10, 1913. Area, 3327 square miles; population (census of April 17, 1911), 344,001. Canea, the capital, has 25,185 inhabitants. Greek is the language of the people a large majority of whom are Christians. The chief products for export are wheat and fruit, wool, soap, olive oil, carobs, vullonea, and cheese.

**CRICKET.** The principal cricket matches of the year 1917 were those played for the Halifax Cup. The New York team was the victor with 6 games won, and 2 lost, total points 5. The standing of the other competitors was: Frankford, Pa., won 5, lost 1, total points 4; Germantown, Pa., won 2, lost 4, total points 2; Merion, Pa., won 0, lost 6, total points 0.

The Manhattan and Columbia Oval clubs tied for the Metropolitan District League championship, each winning 9 games and losing 1. Brooklyn finished second with 6 victories and 1 defeat.

The Manor Field Club captured the laurels in the New York and New Jersey Association, winning 7 matches, losing 2, and drawing 2. Bensonhurst was second with 6 victories, 2 defeats, and 4 draws.

**CRIMINOLOGY.** See PENOLOGY.

**CRIMMINS, JOHN DANIEL.** An American contractor and capitalist, died in New York City November 9, 1917. He was born in New York City May 18, 1844, and was educated at St. Francis Xavier College. In 1864 he became a partner in his father's contracting business and in 1873 head of the firm. He built many important public works, and was an enthusiastic promoter of all enterprises calculated in his judgment to improve and beautify his native city. He was one of the first to use the steam drill in excavating, and after proving his ability in many kinds of planning and building, he became the head of one of the greatest contracting concerns in the United States. In addition to laying out parks and streets, he built some of the greatest churches, hospitals, and many other public edifices, while equally prominent as a constructor of street railways. He built the larger part of the city's elevated railroads and its first underground trolley system. So wide and varied were his activities as a contractor that he was said to have built "a considerable portion of New York and her public utilities." At one time he employed as many as 20,000 men. His great business successes and popularity made him in the estimation of the Democratic party, to which he belonged, an acceptable candidate for political honors; but he usually declined the latter, the only city office he ever filled being that of Park Commissioner (1883-88). He was three times a Democratic Presidential elector and in 1894 a delegate to the New York State Constitutional Convention. On several occasions he acted successfully as arbitrator in settling strikes. His eminence as a contractor and capitalist led him into large insurance, real estate, and financial operations. He became president of, or a director in, several industrial and financial corporations, and a trustee or member of many benevolent societies. One of the most prominent Catholic laymen in the country, he contributed munificently to the charitable insti-

tutions of his Church, and in 1901 was honored by Pope Leo XIII, who conferred upon him the title of Knight Commander of the Order of St. Gregory the Great. Mr. Crimmins made a large collection of books and publications of Irish history and literature, and of publications relating to New York, of whose history and development he had an intimate knowledge that often made him the trusted advisor of city officials.

**CRITICISM. LITERARY.** See articles on French, German, Italian, Russian, Scandinavian, and Spanish Literatures; also LITERATURE, ENGLISH AND AMERICAN.

**CROATIA AND SLAVONIA.** A crownland of Hungary (but not a part of "Hungary proper") extending from the Danube and Drave rivers westward to the Adriatic Sea. Croatia and also Slavonia are each a titular kingdom. The eastern part of the crownland is Slavonia, which lies between Hungary proper and Bosnia. Area of the crownland, 16,425 square miles. The population at the census of December 31, 1910, was 2,621,954, as compared with 2,416,304 in 1900; as estimated in 1913, 2,668,569. The capital is Agram (Zágráb), with 79,038 inhabitants in 1910; Osjek (Eszék) had 31,388 inhabitants. The crownland has autonomy in respect of public instruction, justice, and internal affairs. The Diet consists of 90 members, elected for five years. Croatia and Slavonia are represented by 40 members in the lower house of the Hungarian Parliament.

**CROOKER LAND.** See POLAR RESEARCH.

**CROMER, EVELYN BARING**, first Earl. A British statesman, died in London, January 29, 1917. The son of Henry Baring, a member of Parliament, he was born at Cromer Hall, Norfolk, February 26, 1841. He was destined to the army from the beginning, receiving his training at Woolwich and entering the Royal Artillery at the age of 17. Three years later he went to the Ionian Islands as aide to Sir Henry Storks, whose secretary he was made in 1865. Meanwhile he had sojourned in the United States for a time, to study the Civil War. He received permission to go to the front and reached the Union lines before Petersburg. At the end of a period (1872-76) as private secretary to his cousin, the Earl of Northbrook, then governor general of India, Baring was promoted from captain to major and within a year was appointed a commissioner of the Egyptian Public Debt. It was by his influence on the board which was examining into the financial methods of the Khedive Ismail that he first gained attention, and he held it thereafter. When Ismail had to abdicate, Baring became controller general. After three years as financial member of the council of the governor general of India, he returned, as Sir Evelyn, to Egypt to assume the post of agent and consul general. It was for his constructive work in this country that he became famous. Largely to Lord Cromer Egypt owes what she is to-day, and of course the debt, is equally Great Britain's.

When he arrived, in 1883, he found the country falling apart, the Khedive Tewfik having failed to follow in Ismail's despotic footsteps and the British Government having made a futile effort to establish something like constitutional government. He proceeded to show himself a genius in organization. The internal affairs of the country were placed on a sound ba-

sis, beginning with the public works department, which began to exercise effective control of irrigation. The new agent did not stop till every Government department and the army were in a condition to render efficient service. Before he resigned, because of ill health, Egyptian credit was on a par with that of any other country; he found it almost non-existent. But Lord Cromer was a statesman and not merely an administrator. On his advice the British ministry was persuaded that temporarily the Egyptian government should abandon its claim to the Sudan. Later, when it came to a crisis, he did all in his power to support Kitchener in that general's great march to Khartum. Cromer's relation to General "Chinese" Gordon and the expedition that terminated so fatally, was later explained. Although the British Government insisted on using Gordon for the relief mission, against Cromer's advice, the consul general aided him in every way and endorsed his request for the despatch of Zobeir to Khartum. The refusal of the British Foreign Office to comply made possible the tragedy that Kitchener avenged.

Lord Cromer had been baron since 1892, viscount since 1898, and earl since 1901. He received the highest honors that could be bestowed in recognition of his services, the Order of Merit, membership in the Privy Council, the G. C. B. and G. C. M. G., the honorary doctorate of laws from Oxford and Cambridge, and the Albert medal of the Society of Arts. In his later years he had been a minister plenipotentiary in the diplomatic service. His grasp of international affairs had been proved by his part in the negotiations leading up to the Anglo-French Declaration of April 8, 1904, by which Great Britain received recognition of her control in Egypt and the Egyptian government gained financial freedom. Also in 1906, when Turkish encroachments on the Sinai peninsula threatened the Suez Canal, Cromer had promptly taken measures which blocked any designs the Ottoman government may have had. Shortly before his death he was chairman of a commission appointed to investigate the Dardanelles campaign.

A list of the books published by Lord Cromer indicates how wide was the range of his interests: *Staff College Essays; Paraphrases and Translations from the Greek; The War Game* and other military works; *Modern Egypt* (2 vols.), which tells the story of his work of reconstruction; *Ancient and Modern Imperialism; Political and Literary Essays* (3 series, the third published in 1916); and *Abbas II*.

**CROPS.** See article AGRICULTURE and section *Agriculture* under various countries and States of the United States.

**CROSS COUNTRY RUNNING AND MARATHONS.** James Henigan of the Dorchester Club, Massachusetts, was the star performer in cross country running during 1917. Henigan attained the supremacy by winning the senior race of the Amateur Athletic Union at Franklin Park, Boston, Mass. His time was 33 minutes, 58 seconds. W. Kyronen, of the Millrose A. A., New York, put up a hard fight for the honors, finishing only  $\frac{1}{2}$  of a second behind the winner. The team trophy went to the Dorchester Club with the Millrose A. A. second and the Paulist A. C., New York, third.

G. T. Nightingale, of New Hampshire State College, sprang a big surprise by capturing the junior cross country championship in a race held

over the Van Cortlandt Park course, New York City. His time was 33 minutes, 26 seconds. J. Tuomikoski, of the Dorchester Club, finished second in 33 minutes, 33 seconds. The team prize was won by the Paulist A. C., the St. Christopher Club, New York, being second and the Brooklyn A. A. third. One hundred and three runners, among them many soldiers from the training camps, completed the course.

The University of Pennsylvania won the intercollegiate title race over the Van Cortlandt Park trail. Cornell was second and Columbia third. The individual winner was I. C. Dresser, of Cornell. L. L. Glover, Pennsylvania, finished second. The winner's time was 33 minutes. The college freshmen event went to Syracuse with Harvard second and Yale third. The individual winner was D. O'Connell, of Harvard, in 16 minutes, 12 seconds.

William J. Kennedy, of the Morningside A. C., won the American Marathon, 25 miles, contested under the auspices of the Boston A. A., his time being 2 hours, 28 minutes, 37½ seconds. The winners in other marathons of the year were: Mercury A. C. Run, Yonkers, Joseph Giorgio, Paulist A. C.; Brockton Run, Clarence H. De Mar, Dorchester Club; N. Y. Evening Mail Marathon, Hannes Kolehmainen.

**CRUISERS.** See BATTLESHIPS; NAVAL PROGRESS.

**CUBA.** A West Indian republic, consisting of the island of Cuba, the Isle of Pines, and adjacent islets. Capital, Havana.

**AREA AND POPULATION.** The republic is divided into six provinces, having a total estimated area of 44,164 square miles (114,385 square kilometres). The table below shows the area by provinces, the population according to the census of September 30, 1907, and the population according to an enumeration of November, 1916:

	Square miles	Population	
		1907	1916
Pinar del Río.....	5,207	240,372	269,166
Habana .....	3,171	538,010	688,057
Matanzas .....	3,257	239,812	280,353
Santa Clara.....	8,250	457,431	595,229
Camagüey * .....	10,066	118,260	193,201
Oriente † .....	14,213	455,086	604,530
Total.....	44,164	2,048,980	2,627,586

\* Formerly Puerto Príncipe.

† Formerly Santiago de Cuba.

In 1907 native whites numbered 1,224,539; foreign whites, 203,637; colored, 620,804 (of whom 274,272 negroes, 334,695 mulattoes, 11,837 Chinese). In 1914 births numbered 85,317, deaths 35,887; in 1915, 80,582 and 35,086. In 1914, immigrants numbered 25,911 (including 20,140 Spaniards); in 1915, 32,795 (including 24,501 Spaniards); in 1916, 55,121. Of the immigrants in 1916, Spaniards numbered 37,615; Jamaicans, 7133; Haitians, 4992; Porto Ricans, 1277; Americans, 1209. Estimated urban populations (the figures are for cities proper, not municipalities, which in some cases include large rural areas): Havana, 359,000; Santiago de Cuba, about 50,000; Matanzas, about 40,000; Cienfuegos, about 35,000; Camagüey, about 34,000; Cárdenas, about 26,000; Sancti Spiritus, about 20,000; Santa Clara, about 20,000.

**EDUCATION.** Elementary instruction is by

law free and compulsory. The 1907 census returned 31 per cent of the population as unable to read. Teachers in elementary schools in 1915, 4931; pupils enrolled, 289,692; average attendance, 183,947. A government secondary school is maintained in each of the six provinces; total students, over 2000. The University of Havana has upwards of 1400 students.

**PRODUCTION.** Cuba owes its prosperity to its large crops of sugar cane and fine tobacco. Other important products are cereals, potatoes and other vegetables, cacao and fruits, especially pineapples, bananas, oranges, and coconuts. Tobacco cultivation is most important in the western province of Pinar del Río. It makes possible the large industry of cigar and cigarette manufacture. The reported number of cigars produced in Cuba in 1916 was 390,126,959, of which 222,772,259 were made in Havana. Cuban consumption of cigars in 1916 was stated at 268,463,650.

Cuba leads the world in the production of cane sugar. A record output was made in 1873, with about 775,000 metric tons of raw sugar. This yield was not attained again until 1891, when the output was 819,760 tons. In 1894 the yield was 1,054,214 tons and in 1895 1,004,264 tons. The war for independence reduced production to 225,221 tons in 1896. There was no remarkable increase until 1901, when 635,856 tons were produced. Since 1901 there has been a rapid and continuous increase except in 1908, 1911, and 1915. The output in 1912 surpassed all previous yields, amounting to 1,895,984 tons; in 1913 the production was 2,428,537 tons; in 1914, 2,597,732 tons; in 1915, 2,592,667 tons; in 1916, 3,007,915 tons; in 1917, about 3,020,000 tons. The political disturbances in Cuba in 1917 caused many foreigners to leave the country and as a result the labor supply was insufficient to harvest the 1918 sugar crop. There was also a shortage of bags. In December, 1917, it was reported that 1,384,812 acres of cane were under cultivation. The yield in good years is about 2½ tons per acre. It was expected that the 1918 crop would exceed the record crop of 1917.

Cattle raising is an important industry. Live stock as reported for December 31, 1915: cattle, 3,703,928; horses, 720,040; mules, 54,264; asses, 2882.

Cuba has large mineral resources, especially in the province of Oriente. The minerals include iron, of which there are immense deposits, manganese, copper, lead, zinc, gold, potash, asphalt, salt, and petroleum. The principal minerals worked are iron and copper. In 1917 petroleum production in the vicinity of Havana was of great promise.

**COMMERCE.** In the fiscal year ending June 30, 1916, imports and exports were valued at \$201,023,670 and \$336,801,378, as compared with \$128,132,090 and \$219,447,322 in the fiscal year 1915. The course of the foreign trade is shown below, in thousands of dollars for fiscal years:

	1907	1912	1913	1914	1915	1916
Imports:						
	97,334	120,229	135,811	134,008	128,132	201,024
Exports:						
	114,813	146,788	165,208	170,797	219,447	336,801

Leading imports in the fiscal years 1915 and 1916 respectively, in thousands of dollars:

breadstuffs, 17,954 and 22,000; machinery, 8538 and 19,544 (exclusive of agricultural implements free of duty, 347 in 1916); meats, 11,111 and 13,976; cotton and its manufactures, 9716 and 12,819; vegetables, 6060 and 8774; iron and steel and their manufactures, 5346 and 8489; leather manufactures, 5532 and 7073; apparatus, carriages, cars, etc., 3296 and 6779; vegetable fibres (other than cotton) and their manufactures, 6264 and 6377; beverages and edible oils, 4246 and 5096; wood and its manufactures, 3025 and 5037 (exclusive of unplanned pine lumber free of duty, 2861 in 1916); coal, 4296 in 1916; dairy products, 3241 and 3711; oils, soap, etc., 2507 and 3265; fish, 2510 and 3120; paper, 1601 and 2573; mineral oils, etc., 1448 and 2381; wool and hair and their manufactures, 822 and 1399. Export values in fiscal years, in thousands of dollars:

The sugar export in the fiscal year 1916, valued at \$252,696,678, amounted to 6,746,622,964 pounds; of this, the United States took 5,146,896,503 pounds, valued at \$194,421,530, and the United Kingdom 1,300,353,084 pounds, valued at \$47,578,810. The export of leaf tobacco in 1916 was 33,783,877 pounds, valued at \$12,654,876; the United States took 19,639,545 pounds, valued at \$9,189,364, and the Netherlands 6,439,014 pounds, valued at \$1,473,598. Cigars were exported to the number of 123,756,345, valued at \$8,787,412; the United States took 42,019,668, valued at \$3,392,764, and the United Kingdom 47,136,825, valued at \$2,923,078. The entire copper and iron ore export went to the United States in 1916; copper ore amounted to 82,290 tons, valued at \$4,229,652, and iron ore 842,598 tons, valued at \$2,389,124.

Total, incl. others. 165,208 170,797 219,447 386,801

**COMMUNICATIONS.** Railway communication is established almost from one end of the island to the other. There are four important systems: the United Railways of Havana (705 miles), the Cuba Railroad (589), the Cuban Central Railway (349), and the Western Railway of Havana (147). Through trains run daily between Havana and Santiago de Cuba, but over tracks belonging to three different systems, and many branch lines from this main trunk connect the principal ports on both the north and south coasts with the interior. The total length of railway in operation is stated at 2390 miles, including over 500 miles of private track serving the large sugar estates. Number of telegraph offices as reported for 1915, 226; government radiotelegraph stations, 9; post offices, 658.

**FINANCE.** The standard of value is gold. A new coinage was introduced December 1, 1915, the monetary unit being the gold peso, equivalent to the American dollar. American coinage continues to be a legal tender. The budget for the fiscal year ending June 30, 1917, showed estimated revenue of \$41,828,580 and estimated expenditure of \$40,262,906; for the fiscal year 1918, \$46,679,942 and \$36,337,686. The actual revenue for 1917 was reported at \$44,498,708. The customs receipts for the fiscal year 1916 were reported at \$31,353,691, as compared with \$24,327,114 in the preceding fiscal year. Public debt (1917), \$68,908,000.

**GOVERNMENT.** The legislative power is exercised by a congress of two chambers, the Senate and the House of Representatives. Senators (24 in number, 4 from each province) are elected by indirect vote for eight years; representatives (114) are elected by direct vote for four years. Male citizens over twenty-one years of age have the suffrage. The executive authority is vested in a president, who, with a vice-president, is elected by indirect vote for four years and is ineligible for more than two consecutive terms. The president is assisted by a cabinet representing eight government departments. On May 20, 1913, Gen. José Miguel Gómez was succeeded as president by Gen. Mario García Menocal, the successful candidate of the Conservative party. Gen. Menocal was again a candidate at the election of November 1, 1916, his opponent being Alfredo Zayas, candidate of the Liberal party, supported by ex-President Gómez. Menocal's reelection was declared November 5 but it was contested, and was finally proclaimed by the Cuban Congress May 7, 1917. His term of office expires May 20, 1921. Vice-president, Emilio Núñez.

#### HISTORY

**UPRISING AGAINST THE GOVERNMENT.** Difficulties over the elections of November, 1916, led to a revolt under ex-President Gómez, on

February 9, 1917. In the elections the president, M. G. Menocal, the Conservative candidate, was again chosen. On the other side, Señor Alfredo Zayas, vice-president under Gómez, was the candidate of the united Liberal party, having the support of those who voted for him in the 1912 election and also of the adherents of Gómez. The elections were very close and both sides claimed the victory. A number of votes were contested in the provinces of Oriente and Santa Clara. These contests were carried to the supreme court and the decision was in favor of the Liberals, but some of the ballots had been destroyed and for these cases a second election was ordered. The Liberals, under the leadership of ex-President Gómez, revolted without waiting for the elections. The seat of the revolt was in the eastern provinces. Santiago de Cuba was seized by the rebels and sugar crops in the province of Oriente were destroyed by them. The Conservatives declared that the revolt was intended to stop the elections. In this it was not successful. One of the elections was held, namely, that in Santa Clara. The rebels afterward took possession of the city of Oriente. Thereupon the president, by proclamation, postponed the Oriente elections. Secretary Lansing of the United States appealed to the people of Cuba in an address on February 12 not to plunge the country into civil war, and he addressed a second warning to them on February 14 saying that the United States would not recognize any government that was set up by violence. Meanwhile, the American government had granted a request from the Cuban government for the sale of rifles and ammunition. On February 17 loyal troops captured the city of Santi Spiritus where General Gómez had formerly lived, and soon afterwards two other cities of the province of Oriente fell into their hands. On March 7 General Gómez and his whole staff, together with three hundred men, were taken prisoners by government troops after a battle in which more than 3000 soldiers participated and in which the rebels were said to have lost 100 killed and 300 prisoners. On March 6 Commander Belknap, who was at the head of American naval affairs at Santiago, issued a warning against taking part in military operations in the province of Oriente, except under orders from the provincial commandant. On March 8 the insurgents, having left the city, he landed four hundred blue-jackets from the American vessels to protect American interests if necessary. On March 24 the American government repeated its promise to support the Cuban government in the re-establishment of order and its condemnation of the conduct of the rebels. The reflections in Oriente took place on April 9, those in Santa Clara having been already held in February. When the final returns were announced it appeared that out of 122 electoral votes, President Menocal received 86; Señor Zayas, 36; the Conservatives carrying four out of the six provinces. General Menocal took the oath of office on May 20.

Meanwhile the revolt had subsided. It was learned on April 1 that Major R. Fernandez, the leader of the rebels in the province of Oriente, with some others, had fallen into the hands of the American naval forces, and that the Cuban government would immediately ask for their extradition. Colonel R. Manduley, former

governor of the province and head of the Liberal party, then surrendered with five hundred followers at Guantánamo; the surrender of other forces soon followed and, after the beginning of April, the revolution was virtually at an end. The president's message to congress after condemning the violations of the law, expressed gratitude for the course taken by the United States.

**RUPTURE WITH GERMANY.** A war resolution was passed unanimously by both houses of congress and was signed by the president on April 7. This declared that a state of war existed with Germany from that moment and that the president was authorized to use all the land and naval forces in the manner that he thought necessary and was to give to congress a report as to the measures that he had taken. The authorities thereupon seized four German and one Austrian vessel in Cuban waters. Toward the end of the month a mission was appointed to visit the United States and confer with the American government in regard to Cuba's part in the war.

**REPORTED PLOTS.** On February 20 the government declared that it had discovered a plot to kidnap or murder the president on his way to his country house in the suburbs, and a number of arrests were at once made. On May 10 a plot to assassinate the president was reported at Havana. A government agent who was working with the conspirators revealed the plot and delivered to the government the bomb which was intended to be used against the president.

**FINANCIAL MEASURES.** The president authorized the issue of \$13,000,000 in government bonds for a war loan beginning July 1, and to bear interest at not more than 6 per cent. On May 26 several revenue measures were announced in the press including a normal tax of 10 per cent on each bag of sugar weighing 325 lbs. or more and an extraordinary war tax of 10c when the price reached 3c. a lb. There was also to be a tax of 6 per cent on the net profits of sugar companies operating in Cuba; and taxes were imposed on the net profits of mining and insurance companies.

See **WAR OF THE NATIONS.** *The Diplomacy of the War.*

**CUMBERLAND PRESBYTERIAN CHURCH.** According to the latest available statistics, this denomination, including the Cumberland Presbyterian Church (colored) had about 1150 ministers, 1700 churches, and 85,000 communicants. The denomination publishes a weekly journal, the *Cumberland Presbyterian*, as well as several Sunday School periodicals and some literature. The missionary work is not as satisfactory as it might be because so many of the presbyteries and synods have organized their own board of missions, thus causing a considerable loss to the income of the board of missions for the whole church. In 1917 satisfactory progress was made in all lines of endeavor with the exception of revival work. This branch had not brought as many converts into the fold as was hoped and strong efforts were to be made to overcome this seeming stagnation.

**CURACAO.** A Dutch colony in the West Indies, with an area of 436 square miles and a population, December 31, 1915, of 56,754. Composed of the islands of Curaçao (212 square

miles), Bonaire (Buen Ayre), Aruba, St. Eustatius, and Saba, and part of the island of St. Martin. Total imports (1915), 4,665,431 guilders; exports 2,338,413. Vessels entered 1915, 2930, of 837,848 tons. The budget for 1917 showed estimated revenue of 758,694 guilders; expenditure, 1,316,815.

**CURRENCY.** See BANKS AND BANKING; COINS, VALUE OF FOREIGN; and FINANCIAL REVIEW.

**CURRIER, ENOCH HENRY.** Principal of the New York Institution for the Instruction of the Deaf and Dumb, died August 19, 1917, at the age of sixty-eight. He was widely known in this country and abroad for his work among the deaf, dumb, and blind to which he devoted practically his entire life. He wrote a number of books which are accepted as authoritative on the subjects. Among them are: *Speech-Teaching to the Deaf*; *Aural Development*; *New Aids to Hearing*; *The Manual Alphabet in the Public Schools*.

**CUTTER, EPHRAIM.** An American physician and food specialist, died at West Falmouth, Mass., April 25, 1917. He was born at Woburn, Mass., in 1832, graduated at twenty from Yale, and four years later took his degree at Harvard Medical School after studies under Oliver Wendell Holmes and J. P. Cooke. In 1857 he received the degree of M.D., also from Yale. Dr. Cutter practiced first at Woburn, later at Cambridge and Boston, and from 1881 in New York. For a time he was professor of morphology and applied medicine in the College of Physicians and Surgeons, Boston. He invented various surgical and especially gynecological instruments, early experimented in microphotography of the blood and sputum, discovered a tuberculosis cattle test in 1894, and made other contributions. Besides some 800 papers in medical journals, he published several books on food in relation to health and disease, two of them in collaboration with his son, Dr. John A. Cutter. He was a member of the Ninth and Tenth Medical Congresses.

**CYCLING.** Arthur Spencer of Toronto, Canada, wrested the bicycle sprint championship from Frank L. Kramer, who had held the title for fifteen years. This was the outstanding feature of the year 1917 in cycling. Spencer captured four firsts during the season and finished fourth once for a total of 21 points. Alfred Goulet also succeeded in beating out Kramer, amassing a total of 18 points, as against the veteran's 9. The professional paced championship was won by George Wiley with 92 points. Victor Linart was second with 61 points and Percy Lawrence third with 58.

The amateur title went to John K. Staehle with Fred Taylor second and C. Dotterweich third. The six-day race held at Madison Square Garden, New York, was won by the Goulet-Magin team. The largest crowds on record attended this annual contest. Because of the war the Union Cycliste Internationale suspended operations, and no world championship races were held.

**CYPRUS.** The island of Cyprus is situated in the easternmost basin of the Mediterranean Sea, with Asia Minor to the north and Syria to the east, at distances of 60 and 41 miles respectively. It lies between 34° 33' and 35° 41' N. latitude, and between 32° 20' and 34° 35' E. longitude. The port of Larnaca on the southern

coast is 258 miles from Port Said and 1117 miles from Valletta in Malta.

Its area is 3584 square miles (after Sicily and Sardinia), the third largest Mediterranean island. Its largest length from west-southwest to east-northeast, between Cape Drepano and Cape St. Andrea, is about 140 miles, and its greatest breadth from north to south is about 60 miles.

From 1489 till 1571 Cyprus belonged to the republic of Venice. Then the Turks gained and maintained possession of it until its cession for administrative purposes to England in 1878; and in 1914, at the outbreak of war with Turkey, the British Crown formally annexed it. About 25.9 per cent of the population (which totaled 274,108 in 1911 and was estimated, December 31, 1915, at 294,664) are Ottoman Turks.

The government railway from Famagusta to Nicosia (36 miles) came into use in August, 1905; was in 1907 extended to Morphou (25), and to Evrychou (15) in 1915.

	1912	1913	1914	1915
Imports, mdse..	\$262,345	\$2619,337	\$496,744	\$588,019
Imports, B. & S.	104,692	56,747	73,306	24,598
Exports, mdse..	728,988	620,591	496,776	650,490
Exports, B. & S.	60,427	78,322	58,463	10,907
Revenue .....	834,685	841,816	290,110	303,892
Expenditure ...	258,661	286,165	316,414	294,318
Shipping .....	644,363	721,515	581,926	308,311

In the above table, imports and exports of merchandise and bullion and specie, with shipping in total tons entered and cleared, are given for calendar years; revenue and expenditure for fiscal years ending March 31, 1912, 1913, 1914, and 1915. Maj. Sir John E. Clauson was appointed British high commissioner in December, 1914.

**DAHOMY.** A French West African colony; one of the component parts of the government-general of French West Africa (q.v.). With a coast line of only seventy miles (about), the colony includes an extensive hinterland. A recent estimate of population is 910,902 of whom 809,402 fetishist, 75,000 Mohammedan, 20,064 Roman Catholic, and 6500 Protestant. Capital, Porto Novo, with 40,000 inhabitants; other towns are: Abomey (12,372), Ouidah or Whydah (13,000), Grand Popo (2115), and Cotonou (2456). The principal products for export are palm kernels, palm oil, dried fish, live animals, corn, copra, cotton, kola nuts, etc. A railway (722 kilometres), which when completed will connect Cotonou with the Niger at a point near Karimana, is finished as far as Savé (261 kilometres). The line has three main sections: Cotonou to Paouignan, 194 kilometres; Paouignan to Parakou, 246; Parakou to the Niger, 250. A branch from Cotonou (32 kilometres) runs to Ouidah and Segboroué.

**DAIRYING.** THE SITUATION IN THE UNITED STATES. The number of milch cows in the United States in 1917 was 23,906,000 as against 22,768,000 in 1916 and 20,497,000 in 1913. The annual milk yield per cow in 1917 was estimated at 3715 lbs., or a total production during the year of 84,611,350,000 lbs. During the fiscal year ended June 30, 1916, exports of dairy products amounted to about \$24,000,000, with imports at about \$11,000,000. For the year ended June 30, 1917, the exports were about \$49,000,000, and the imports \$9,000,000. The exports of condensed milk alone increased from

16,000,000 lbs. in 1914 to 259,000,000 lbs. in 1917.

Because of the large place held by dairy products in food economy, efforts were made by the U. S. Department of Agriculture and the State experiment stations to insure an adequate food supply by the elimination of waste, the more complete utilization of by-products, and by advising producers as to ways and means of meeting the high cost of feed without sacrificing their dairy cows. The U. S. Dairy Division recommended that skim milk, which is often fed to pigs or thrown away, be made into cottage cheese, a wholesome and nutritious food which may be used to replace meat to some extent in the diet. Directions for making the cheese and recipes for its use were prepared and widely circulated. An enormous increase in the output and consumption of this cheese resulted. The work of cow-testing associations enables the dairy farmer to feed his cows to better advantage and to eliminate unprofitable cows from his herd. There are now 472 active cow-testing associations and 36 bull associations in the United States.

The dairy industry was making rapid strides in the South, especially in the regions of the cotton belt invaded by the boll weevil. Millions of acres formerly in cotton in 1917 produced corn and velvet beans, and as a result farmers in those regions were feeding their dairy cows this winter on home-grown feeds entirely. The creamery association of Mississippi established a system of grading cream, with payment arranged on a quality basis. In the mountainous sections of the South, where summer nights are cool and cold water is abundant, small cheese factories were proving very successful. In 1917 there were thirty-four cheese factories in this region, and the output for the year was estimated at \$100,000.

The milk supply of the larger cities in the United States continued in a very unsettled condition. The high prices of feeds, the scarcity and advanced cost of labor, and the increased demand for milk for condensing and other purposes were factors in the agitation for high prices. The December price to producers at points not more than 100 miles from New York was \$3.15 per 100 lbs. for grade B milk, testing 3 per cent fat. At Chicago the price set for milk for November and December was \$3.22 per hundredweight. These price agreements were for one month only. For the purpose of solving the whole problem of metropolitan areas, the U. S. Food Administration adopted the plan of appointing regional milk tribunals. The producers, distributors, consumers, milk experts, and the public at large were to be represented on these commissions. The personnel of the commissions for the Chicago, New York, and Baltimore dairy districts was announced by the end of the year, and hearings were being held to secure information on which to base milk prices, and to investigate possibilities of reducing costs of distribution. In many cities community centres and other co-operative organizations were arranging for the delivery of milk direct from producer to consumer.

The average wholesale price of milk in the United States remained practically stationary at about 20 cents per gallon until the middle of 1916, since which it has steadily increased,

the increase being quite rapid from August, 1917. The average wholesale price of milk in November was 29.1 cts., and the retail price 38.9 cts. per gallon.

By an agreement between the representatives of the butter and egg exchanges of the nation and the U. S. Food Administration, all speculation in butter and eggs was eliminated for the period of the war. The Elgin butter board voluntarily closed its activities during the war.

**DAIRY INVESTIGATIONS.** The large amount of emergency investigations and of propaganda work being done has not materially interfered with the more fundamental dairy research in the United States. The Missouri Experiment Station determined that important variations occur in the composition and properties of milk, due to the underfeeding of the cow, and that these variations have an important bearing on the use of such milk for infants. This station also demonstrated that the deleterious effect on the market quality of butter due to feeding large quantities of cottonseed meal might be overcome by feeding silage with the cottonseed meal. Investigations at the Illinois Station showed that the large numbers of bacteria commonly found in milk did not have their origin in the barn. In these studies it was found that in the production of milk of low germ content the udders of some cows may become the principal source of contamination. The U. S. Dairy Division found that the four major factors in the production of clean milk were (1) thorough sterilization of milk utensils; (2) cleanliness of cows, especially of udders and teats; (3) the use of the small-top milk pail; (4) prompt and proper refrigeration.

**DAIRYING IN CANADA AND EUROPE.** Owing to war conditions very little accurate information was obtainable as to dairy conditions in Europe. The dairy investigations reported pertained for the most part to emergency work. It was estimated that 28,000,000 dairy cows had been slaughtered in Europe since the beginning of the war. The value of the milch cows in Canada in 1916 was estimated at \$181,813,000. For the nine months ended March 31, 1917, imports of butter into the United Kingdom were 86,566 tons and of cheese 111,049 tons, as compared with 123,645 tons of butter and 99,384 tons of cheese for the corresponding nine months of the previous year. In London, an amalgamation was made of the dairies for the purpose of eliminating duplication of work in the handling and delivery of milk, and in addition an effort will be made to improve the quality of the milk.

**DAIRY RECORDS.** The Jersey cow, Sophie 19th, completed another year's test at the age of nearly thirteen years, with a production of 15,948.2 lbs. of milk, containing 847.8 lbs. of fat. Four times in her career Sophie 19th exceeded 1000 lbs. of butter in a year. In her lifetime she has produced 91,869 lbs. of milk, 14.64 per cent of which was solids; so that she has produced over 13,458 lbs. of edible solids. At two years old the carcass of a beef steer furnishes about 200 lbs. of edible solids.

The Holstein cow, Aggie Acme of Riverside 2nd, completed a yearly record of 24,683 lbs. of milk, containing 1063.8 lbs. of fat. The Guernsey cow, Murne Cowan, at twelve years old, produced in one year 17,383.5 lbs. of milk and 791.76 lbs. of fat. The average for her

three highest yearly records is 19,373.6 lbs. of milk and 911.78 lbs. of fat. In New Zealand the Jersey heifer, Mere, commenced milking at the age of 1 year and 346 days, and produced in one year 12,164 lbs. of milk and 663.64 lbs. of fat. This was said to be a world's record for cows of this age.

**LITERATURE.** The following is a list of some of the more important dairy literature of the year: W. E. Carroll, "Selecting Dairy Bulls by Performance," in *Utah Experiment Station Bulletin* 153 (Logan, Utah, 1917); C. H. Eckles and L. S. Palmer, "The Influence of the Plane of Nutrition of the Cow upon the Composition and Properties of Milk and Butter Fat: The Influence of Underfeeding," in *Missouri Experiment Station Research Bulletin* 25 (Columbia, Mo., 1916); W. W. Fisk and H. B. Ellenberger, "An Ice Cream Laboratory Guide" (New York, 1917); E. B. Forbes, F. M. Beegle, et al., "The Mineral Metabolism of the Milch Cow: Second Paper," in *Ohio Experiment Station Bulletin* 308 (Wooster, Ohio, 1917); L. A. Klein, *Principles and Practice of Milk Hygiene* (Philadelphia, 1917); C. W. Larson and F. S. Putney, *Dairy Cattle Feeding and Management* (New York, 1917); T. J. McInerney, "Clarification of Milk," in *New York Cornell Experiment Station Bulletin* 389 (Ithaca, N. Y., 1917); Mr. and Mrs. W. J. McLaughlin, *Buttermakers' Short Course* (Owatonna, Minn., 1917); H. N. Parker, *City Milk Supply* (New York, 1917); M. J. Prucha and H. M. Weeter, "Germ Content of Milk—I, As Influenced by the Factors at the Barn," in *Illinois Experiment Station Bulletin* 199 (Urbana, Ill., 1917); *Report of the Special Milk Board of the Massachusetts State Department of Health* (Boston, 1916); J. L. Sammis, "Correct Payment for Cheese Factory Milk by the Babcock Test," in *Wisconsin Experiment Station Bulletin* 276 (Madison, Wis., 1917); W. A. Stocking, *Manual of Milk Products* (New York, 1917); W. van Dam, *Opstellen over Moderne Zuivelchemie* (The Hague, 1916).

**DALMATIA.** A crownland and titular kingdom of Austria. Dalmatia extends along the Adriatic coast from Croatia on the northwest to Montenegro on the southeast, being bounded on the east by Bosnia and the Herzegovina. The area is 4954 square miles, or about that of Connecticut. The population according to the census of December 31, 1910, was 645,866, as compared with 593,784 in 1900; as estimated in 1913, 667,648. In 1910 the number of Austrian subjects was 634,855; of these, Croatian was the vernacular of 610,669 (96.19 per cent); Italian, 18,028 (2.84 per cent); German, 3081 (0.49 per cent). Of the population in 1910, Catholics numbered 539,074 (83.49 per cent); adherents of the Orthodox Church, 105,338 (16.32 per cent); Evangelicals, 575; Jews, 523. About 82 per cent of the inhabitants were dependent on agriculture. The capital is Zara (Zadar); its population in 1910 was about 14,000, that of the commune about 37,000. Spalato had about 21,000 inhabitants; the commune, 27,492. Ragusa (Dubrovnik) had about 9000 inhabitants, with about 14,000 in the commune; Cattaro, about 3000, with about 6000 in the commune. All of these towns are seaports. Dalmatia has a unicameral diet of forty-three members and is represented in the Austrian Reichsrat by eleven members.

**DAMS.** In 1917, there were put under way

comparatively few large hydro-electric projects requiring the construction of dams of unusual size or character. In the United States the question of the development of water power under national control still remained unsettled and few large irrigation projects involving unusual construction were started. In connection with the development of various internal waterways several dams with accompanying locks designed to raise the water to a height suitable for navigation, were completed, and a few new projects were contemplated. Few new dams for water supply reservoirs were either projected or built, and little was heard of European construction. Some of the more notable works of the year are discussed in the following paragraphs.

**BRIDGEWATER, N. C., DEVELOPMENT.** One of the important projects was the construction of three earth dams and two diversion channels to store water from three rivers for a power house near Bridgewater, N. C. The method of construction followed was to wash the central portion of the filling into place between the outside embankments formed by dumping dry material from trestles. The earth for this purpose was being dug by steam shovels and was dumped by train and washed in place by hydraulic giants, whose water was supplied by pumps mounted on a float in a pool between the outside embankments. The level of this pool rose as the fill progressed. In the southerly dam there was being constructed a spillway requiring 200,000 yds. of concrete for which a crushing and mixing plant using local rock was used. The entire construction involved handling of 5,850,000 yds. of fill and the equipment includes 25 locomotives, 150 to 180 dump cars, and 10 steam shovels. The three dams were to store the water in a very irregular area comprising parts of the basins of the Catawba River, Paddy Creek, and the Linville River, a few miles above the point where these three streams join. The water going over the spillway was to pass down the original bed of the Catawba River. In order to throw the three basins into one reservoir, it was necessary to make cuts through the low divides, separating them. That for the diversion channel between the Catawba and Paddy Creek water sheds involved about 500,000 yards of excavation, while but 50,000 yards would have to be removed between the Paddy Creek and Linville River basins. A number of smaller concrete dams were also involved in the project which was owned by the Western Carolina Power Company and was being executed by the Hada-way Contracting Company. This interesting work was discussed in the *Engineering News-Record* for December 27, 1917.

**MISSISSIPPI DAM AND LOCK.** The completion of the new Mississippi River Dam lock No. 1 at St. Paul and Minneapolis and its formal opening on July 3, 1917, made available the use of the river for purposes of navigation thirteen miles further up. The original government project adopted in 1894 provided two locks and timber crib dams of approximately 13½ ft. lift each and 2.88 miles apart. The upper works involving lock and dam No. 2 were completed and in operation by May, 1917, which afforded navigation between St. Paul and Minneapolis at least two months in the year. Lock No. 1 was completed in 1909, but as changes were contemplated involving the development of water

power, the work was halted and the plans as approved by the River and Harbor Act of June 25, 1910, involving substantial changes, were then carried out and brought to completion in 1917. These involved the abandoning of lock and Dam No. 2, remodeling lock No. 1, for a 30-ft. lift, and the construction of a hollow dam 568 ft. long of a modified Ambursen type. This dam consisted of 36 buttresses faced with pre-molded reinforced concrete beams weighing 5 tons each, 19 of these beams on the upstream and 8 on the downstream face. The dam was seriously damaged in the flood of June 29, 1914, and three sections of the dam, including two sluiceways, were undermined and tipped upstream. In the winter of 1914-15, a number of foundation sections were completed and, after further trouble with high water in August, 1916, the dam was completed in the spring of 1917, so that with the final construction of the lock, which involved the raising of the walls of the old lock, it was possible on July 3, 1917, to open the river for traffic. Until such time as additional operating machinery could be installed, the lock was to be operated between 8 a. m. and 4 p. m. for boats not exceeding 36-ft. beam, although the lock is designed for boats of 78-ft. beam. The new construction which was under the charge of Col. E. H. Schulz, U. S. A., made 15,000 horsepower available, in addition to providing a waterway.

**LAURENTIDE DAM.** In 1917 a great crest-gated dam at Grand' Mere, Quebec, for the hydro-electric station of the Laurentide Power Company was completed. At this station, there were in service six 25,000 hp. single-runner turbines and three more were later to be installed. This development was begun in 1913, but work was shut down in October of the following year on account of the war. With the increased demand for power, construction was resumed in 1915, and the work was completed early in 1917. The St. Maurice River at this point is divided into two channels by a large island in the middle and where the streams come together there was a rocky gorge with a natural fall of about 45 feet. Previously, there had been wooden dams across each channel affording a lake about four miles long above the falls, and increasing the natural fall to 50 feet so that 20,000 hp. could be developed in 17 turbines. In the later development a series of concrete dams was thrown across the river downstream from the old wooden dams, and with the exception of 330 ft., the west channel was dammed by the powerhouse itself. The island in the centre was excavated, and across the east channel a new dam was constructed with a main spillway extending for about 890 ft. The main spillway had gates of the regular Stoney type handled from steel bridges, while the west spillway consisted of a gravity overfall section with 14 piers supporting a foot-bridge. The east channel dam consisted of a low gravity overfall section with 18 gates; the piers supporting the gate frames were 46 feet long by 25 feet high. On the east end of the main spillway, there was a wing wall, which, springing off at an angle, ties into the high east bank. Inasmuch as the head available had been raised to 84 feet, the turbines used were to operate at the highest head capacity of any except those at Yarkin Narrows, N. C.

**MAMMOTH DAM FAILURE.** One of the notable

dam failures of the year was of the Mammoth dam of the Price River Irrigation Company, Utah, which occurred on June 24-25, 1917. This was examined by the State Engineer who said that the reason for the failure was the improper and inadequate construction of the flume portion of the spillway; the inadequate reinforcement of the core wall and the undue level of water in the reservoir in respect to the core, maintained by the management of the company. The failure of this dam which was located in the central part of the valley of the Wasatch Mountains at an altitude of 8500 ft. was serious in that it involved a loss of a large volume of water stored for irrigation and the destruction of the Scofield branch of the Denver and Rio Grande Railway from Colton to Hale. Eleven miles of the main line were destroyed and practically all the bridges were washed away. The destruction of the railroad caused the shutting down of the coal mines in the district, one of the largest producing sections of the West, of which the Denver and Rio Grande was the only outlet. The dam itself at the time of the failure had been built to an elevation of about 70 feet above stream bed and was 160 ft. wide on top with a concrete heart wall along the axis. The reservoir thus formed held about 11,000 acre feet of water. It was an earth-filled structure with a concrete heart wall founded on exposed bed rock in the stream bed and sides of the canyon. The bedrock was sandstone lying in strata sloping gently downstream, and between the strata was either shale or clay. The dam had been raised from time to time as further demands were made upon it, and the original plans and specifications approved by the state engineer were not followed.

**LAGUNA DAM.** The Secretary of the Interior, Franklin K. Lane, late in 1917 gave permission to a delegation from the Imperial Valley to connect the canal system with the Laguna dam so as to irrigate the valley. It was suggested that before the construction was undertaken, the people of the district should vote on the plan of building a series of storage dams in the Colorado River and its tributaries, to increase the water supply during low water. These dams would be built under Congressional permission and appropriations, and would be paid for by the water used in irrigation. It was agreed that both matters should be submitted to the people of the Imperial Valley.

**EAGLE'S NEST DAM.** An arch dam of remarkably short radius for its height was nearing completion on the Cimarron River, N. M., late in 1917. It was known as the Eagle's Nest dam and was 140 ft. in height, 30 ft. of this amount being below the river bed, and it had a radius of 155 ft. It was 8 ft. wide at the top and 46 ft. at the base, being thrown across the narrow canyon which was 40 ft. wide at the base of the dam and 300 ft. at its crest. This canyon drains the Moreno Valley in Colfax County, and the new dam was to impound 80,000 acre-feet which would irrigate 30,000 acres of the 400,000-acre Charles Springer cattle range.

**DUBLIN DAM.** In 1917, a notable earth-filled dam as a part of the retarding basin control of the Scioto Valley above Columbus, Ohio, was designed by the Franklin County Conservancy District. This Dublin dam was to afford

adequate protection to the city of Columbus against great floods and was notable for providing a duplex system of outlets, those at the base being so small that they would throttle the summer floods down to the desired maximum flow, and a large funnel-shaped draft tube at a higher level would handle the discharge of the great floods of the spring. The dam in addition would provide a supplementary water supply for the Columbus system although this feature was not an essential element of the duplex outlet scheme. The construction of this dam was temporarily postponed on account of the decision of Franklin County Court that it would cost more than the benefits, but the duplex outlet device which was a distinct novelty received approval from hydraulic engineers.

**STANDLEY LAKE DAM.** The construction of earth dams in the United States had figured so prominently in American engineering that the case of the Standley Lake dam which was built in 1908-12 about nine miles north of Denver, Col., attracted considerable interest. In 1914, on the outer or downstream face, it developed a pronounced slippage, while in 1916 on the inner or upstream face, a similar movement took place which in the opinion of many threatened the safety of the entire dam. A discussion of this construction figured at a meeting of the Colorado Association of members of the Society of Civil Engineers in which a history of the entire project was given, and the reasons for the sloughing of the material. It was asserted by some engineers that faulty construction and design were involved in the building of the dam and that it did not involve the best practice as shown in other structures of this kind. The original cost was stated at \$850,000 for embankments and \$150,000 for riprapping, in addition to expense involved for conduits, valves, etc. This construction was summarized in *Engineering News-Record*, May 31, 1917.

**NEW SOUTH WALES.** One of the projects for a great dam under discussion in 1917 was that of the Upper Murray Storage Project of the Water Conservation and Irrigation Commission of New South Wales. A large number of sites had been explored, in most of which the rock was 200 ft. or more below the surface. Borings and surveys were being made of a possible site of the Mitta Mitta River with the Murray, and also storage possibilities of a site near Juzellie were being considered.

**DANIELS, WINTHROP M.** See UNITED STATES, Congress.

**DANISH LITERATURE.** See SCANDINAVIAN LITERATURE.

**DANISH WEST INDIES.** Former colony of Denmark, sold to the United States in 1917, consisting of the three West Indian islands: Saint Croix (area, 84 square miles; pop., 1911, 19,100); Saint Thomas (area, 33 square miles, pop., 1911, 11,150), and Saint John (area, 21 square miles; pop., 1911, 1010). On January 17 the American Secretary of State and the Danish minister to the United States formally exchanged ratifications of the treaty ceding the islands to the United States. The House of Representatives passed a bill continuing for the time being the present government in the Danish West Indies, appropriating \$25,000,000 for the payment, and providing that goods containing no more than 20 per cent of foreign material should be admitted into the United States free

of duty but an export tax of \$8.00 a ton should be charged on sugar exports.

**DARBOUX, (JEAN) GASTON.** A French mathematician, died in Paris, February 23, 1917. He was born at Nîmes in 1842, studied in that city, then in the lycée of Montpellier, and finally at the Ecole Normale in Paris, where he became doctor of science in 1866, after attracting attention by a brilliant thesis. He taught at the Lycée Louis-le-Grand, the Collège de France, the Ecole Normale, and the Sorbonne, where in 1881 he received the highest of honors in being appointed to succeed Charles as professor of higher geometry. Before this he had published a number of memoirs, and these increased steadily year by year. In his writing he covered a wide range—analytical and pure geometry, mathematical physics, mechanics, and algebra. Darboux received the Petit D'Ormy prize in 1883 from the Academy of Sciences, to which body he was elected the next year, and of which he was permanent secretary for seventeen years. In addition to his teaching and scholarly work, he held the post of dean of the Faculty of Sciences from 1889 to 1903 and demonstrated his possession of fine executive ability. One of his accomplishments was the devising of a method by which to approximate the functions of large numbers. In 1870 he helped to found the *Bulletin des sciences mathématiques*. He did important service in editing the works of other mathematicians, Lagrange, Bourdon, Despeyrons, Fourier, Henri Poincaré, but his monumental publication was *Leçons sur la théorie générale des surfaces et les applications géométriques du calcul infinitésimal*, in four volumes, the first of which appeared in 1887. New editions of several volumes appeared shortly before the author's death. From 1902 Darboux was a member of the Bureau of Longitudes, he was a grand officer of the Legion of Honor, and had received the Sylvester medal of the Royal Academy of London for his work. He is to be counted among the chief mathematicians of a century. Consult E. Lebon, *Gaston Darboux, Biographie, Bibliographie* (Paris, 1910).

**DARTMOUTH COLLEGE.** A non-sectarian educational institution for men, at Hanover, New Hampshire. In the fall of 1917 there were 1016 students and 139 members of the faculty. Volumes in the library numbered 140,000. Productive funds amount to \$4,361,761.02 and in 1917 the income from the funds was \$178,705.62. More than 600 undergraduates, including the Class of 1917, had entered the military service before August. Dartmouth was founded in 1769. President, Ernest Martin Hopkins, Litt.D., LL.D.

**DAYLIGHT SAVING.** On January 30 and 31, 1917, the National Daylight Saving Association was formed by a number of delegates meeting in New York at the Hotel Astor. In April, of that year, a bill which had been introduced in Congress by Representative Borland of Missouri and Senator Gallinger of New Hampshire was again offered at the special session of Congress. The bill was favorably reported out of committee and was unanimously passed by the Senate to take effect January 1, 1918. In the House of Representatives, the bill remained in committee and was not brought up for passage during the year.

The plans for the United States as for other nations, was to turn the clock forward an hour during the summer months beginning with the

last Sunday of April at 12 o'clock midnight or at 1 a. m., so that during the summer months, the waking hours would include one hour more each day in the sunshine and our hours of sleep include one hour more of darkness. On the last Sunday of September, the clocks would be turned back to the normal time. According to the advocates of daylight saving for the United States, the plan had a three-fold purpose, namely, saving in coal and lighting bills, more time for recreation and farm gardening, and general health betterment. At the end of 1917, the shortage in coal was a further argument which was introduced in favor of the passage of legislation providing for daylight saving.

This measure was first adopted by Germany in the spring of 1916, and it was later put into effect in England, France, Austria-Hungary, Italy, Sweden, Denmark, Norway, and Holland. In 1917, Portugal, Australia, Iceland, Russia, and Bermuda followed in the adoption of the plan, and it was also adopted by the Province of New Brunswick, Canada, and by many cities throughout the Dominion.

A committee appointed by the British Parliament stated that the measure resulted in an estimated saving of coal throughout Great Britain and Ireland of more than 260,000 tons and also a saving in the quantity of illuminating oil. There was a saving of 23 per cent in the amount of light consumed as reported by the various lighting companies. It was estimated that the annual saving for the United States during the five summer months would be from \$25,000,000 to \$50,000,000 in the lighting bills and in fuel of over 1,000,000 tons. In most of the European countries, the extra hour of daylight afforded opportunity for work in home gardens, and extra activities due to the war. Furthermore, there was much more opportunity for recreation. The bill which was introduced in Congress was endorsed by over 100 leading chambers of commerce, boards of trade throughout the country, by the United States Chamber of Commerce, the Advisory Commission of the National Council of Defense, and various associations devoted to sports. See ASTRONOMY.

**DECIMAL COINAGE.** The movement for the reform of the British coinage and currency which had been under way for a number of years, took an increased impetus in 1917, and a definite scheme for decimal coinage was proposed and approved by a number of organizations including the Institute of Bankers, the Association of Chambers of Commerce of the United Kingdom, and the Decimal Association, an organization especially committed to the adoption of the international metric system of weights and measures in Great Britain, and its colonies. The plan proposed was to retain the pound sterling unchanged in weight and fineness as the national monetary unit, but to divide it into 1000 parts each to be known as a mil. With the gold sovereign of 1000 mils and the half-sovereign also of gold of 500 mils, there would be the double florin 200 mils; the florin, 100 mils; the half florin, or shilling, 50 mils; and the quarter florin, 25 mils, all of silver; while there would be nickel coins for 10 and 5 mils and bronze pieces for 4, 3, 2, and single mils. It will be apparent that down to the sixpence there would be no change in the existing currency, although the crown, half-crown, and threepenny piece would be eliminated, but the

copper or bronze coins would present a considerable variation which would require considerable adjustment in practice and a change of values. This action, while regarded as a progressive step, was not unanimously approved as certain reformers desired the change that would assimilate the British currency to that of Canada and the United States, while others believed that an international system of coinage should be worked out for the entire civilized world, or at least for the allied nations and their dependencies.

**DEGAS, EDGAR HILAIRE GERMAIN.** A French genre and portrait painter who died on September 27, 1917. He was born in Paris, July 19, 1834. He studied under Lamothe in the Ecole des Beaux-Arts and was a careful student of the old masters in the Louvre and Italy. Although usually classed as an Impressionist he must be considered as an independent, his art having been subjected to several influences and above all else, personal. He at first painted in the manner of Ingres, and was also a great admirer of Delacroix, less for that artist's coloring than for the noble action in his pictures. His softness and fluency of modeling resembled the modeling of Manet, and from the Japanese he learned his absolute freedom of composition, fantastic decoration, and peculiar emphasis. His first works were etchings, portraits, and historical paintings, but he soon turned to genre pictures of modern life. His eyesight began to fail him in 1870 but despite that fact he continued to do brilliant work for some years. Among the large variety of subjects which he treated the best known are his "Race Horses" and "Ballet Girls." The former are distinguished for their fine movement, while the latter were his favorite after the seventies. He scoured the slums of Paris in search of picturesque subjects, but still continued, however, to paint portraits, many of which are masterpieces. His color and brushwork are fine. His latter work is almost entirely pastel. His composition is daring and original; he does not hesitate to bisect figures, his stage pictures often showing nothing but the heads of the orchestra and the legs of the dancers. His work is very popular in America, where he paid a lengthy visit in 1873, as well as in France. The Luxembourg acquired, as a legacy from the painter, Caillebotte, a number of his paintings, including the famous "Dancer on the Stage." Degas's pictures now command enormous prices. At the sale of the Rouart collection in 1912 his "Danseuses à la barre" was sold for 435,000 francs, the highest ever paid in France for the work of a living master. He has had a strong influence on the younger generation of artists. For his life and works consult Lemoisne, in *L'Art de notre temps* (Paris, 1912).

**DEJERINE, JULES.** A French neurologist, died in Paris, February 27, 1917. He was born in Geneva, Switzerland, of French parentage, in 1849. From the time that he presented his doctorate thesis in 1879 on *Pathology of the Nervous System in Ascending Paralysis*, he devoted himself largely to nervous disorders. By 1886 he had become associate professor in the Faculty of Medicine, in 1901 he was appointed to the chair of the history of medicine and surgery, later to that of internal pathology, and at the time of his death he was clinical professor of diseases of the nervous system. He had a wide experience in hospital work, rising to be

physician to the Salpêtrière, and since the beginning of the war he had been in charge of the special central service for nervous affections among the wounded, a post of the highest importance. Lately he had published with his wife, who had long coöperated with him, discussions of the regeneration of nerves after suture. Madame Dejerine, formerly Miss Augusta Klumpke, of San Francisco, was the first woman invested with the honorary title of interne of the hospitals of Paris. The two together prepared a remarkable treatise on *The Anatomy of the Nervous Centers* (1894). With Dr. A. Thomas, Dejerine wrote a book on diseases of the spinal cord. He received the Godard prize in 1879 from the Anatomical Society for research on the lesions of the nervous system in diphtheric paralysis, and in 1886 the Montyon prize from the Academy of Sciences for work done with Landouzy (q.v.) on the pathology of muscular dystrophy. He was elected to the Academy of Medicine in 1908, and was a Chevalier of the Legion of Honor.

**DEATH RATE.** See VITAL STATISTICS.

**DELAWARE. POPULATION.** The population of the State in 1910 was 202,322, and on July 1, 1917, it was estimated at 215,160.

**AGRICULTURE.** The acreage, production, and value of the principal crops as estimated by the United States Department of Agriculture in 1916-17 were as follows:

		Acreage	Prod. bu.	Value
Corn .....	1917	230,000	7,820,000	\$10,948,000
	1916	205,000	6,970,000	6,203,000
Wheat .....	1917	181,000	2,162,000	4,497,000
	1916	124,000	1,860,000	3,013,000
Oats .....	1917	4,000	128,000	100,000
	1916	4,000	120,000	74,000
Potatoes ....	1917	13,000	1,235,000	1,606,000
	1916	10,000	900,000	1,125,000
Hay .....	1917	78,000	2,009,000	2,009,000
	1916	80,000	116,000	1,844,000

a, Tons.

**TRANSPORTATION.** The railroads operated in the State are the Wilmington, Philadelphia Traction Company, the Wilmington, Newcastle, and Delaware City, and the People's Railway Company. The mileage of these roads is, respectively, 89, 15, and 29. The total railroad mileage of all the roads operated in or through the State is about 350 miles.

**FINANCE.** There is no statement of finance for the State available later than 1914. In that year the receipts amounted to \$685,203, and the expenditures amounted to \$716,653. There was a balance in the treasury at the beginning of the year of \$45,797, and at the end of the year it was \$14,418.

**EDUCATION.** No statistics for education are available later than 1916. In that year there were enrolled in the public schools 32,511, with an average daily attendance of 13,179. There were 493 female teachers and 101 male teachers. The average yearly salary of male teachers was \$492.93 and of female teachers \$363.34.

**CHARITIES AND CORRECTIONS.** There is no State supervision of charitable and correctional institutions. The principal body having charge is the Associate Charities of Wilmington, which has a direct supervision over many institutions. These include the Home for Friendless Children, the Home for Aged Women, St. Joseph's School for Orphan Colored Boys, the Florence

Crittenden Home, the Delaware Industrial School for Girls, the Home of Merciful Rest, and the Layton Home for Colored Persons, all in Wilmington, and the Delaware Hospital for the Insane, at Farmhurst, the New Castle County Hospital, and several institutions in Dover and Marshaltown.

**LEGISLATION.** Among the more important measures passed by the legislative session of 1917 are those noted below.

Important amendments were made in the laws relating to the administration of the State government. An amendment to the constitution was proposed, authorizing the governor to remove any officer appointed by him, but providing for reinstatement by the court if this removal was found to be without cause. Provision was made for a budget system for preparing and enacting annual appropriations. The child labor laws were amended in important details. A workingman's compensation law was enacted. Legislation was passed looking to the prevention of monopolies and unfair discrimination in the buying and selling of commodities, especially food products. Important amendments were made in the laws relating to corporations. An income tax was created with a minimum exemption of \$1000. Provision was made for the commitment and care of the feeble-minded or criminally inclined persons. A commission was appointed to study the educational system and make recommendations for changes therein.

**STATE OFFICERS.** Governor, John G. Townsend, Jr., Rep.; Lieutenant-Governor, Lewis E. Eliason, Dem.; Secretary of State, Everett C. Johnson; Treasurer, William J. Swain, Rep.; Auditor, William G. Roe, Dem.; Attorney-General, David J. Reinhardt, Rep.; Commissioner of Education, Prof. Arthur F. Spaid, Rep.; Commissioner of Insurance, Thomas R. Wilson, Dem.

**JUDICIARY.** Supreme Court: Chancellor, Chas. M. Curtis; Chief Justice, James Pennewill; Associate Justices, William H. Boyce, Henry C. Conrad, Herbert L. Rice, T. B. Heisel; Clerk, Daniel M. Ridgely.

**STATE LEGISLATURE:**

	Senate	House	Joint Ballot
Democrats .....	7	19	26
Republicans .....	10	16	26
Majority .....	3 R	3 D	..

**DE MORGAN, WILLIAM (FREND).** An English novelist, died in London, January 15, 1917. He came of intellectual and literary stock. His father, Augustus De Morgan, was a famous mathematician and wit who was professor at University College, London, when William was born, November 16, 1839. His mother, a friend of Charles Lamb, wrote *From Matter to Spirit* and edited her husband's *A Budget of Paradoxes*. The novelist's maternal grandfather, William Frend, attacked the established church while at Cambridge and was expelled therefor. But William De Morgan's relation to these persons was not known to the world at large till he was sixty-five years old, for it was then that his first book appeared. After studying at University College School and the college itself, he attended the Royal Academy Schools and started life as a painter. He drew the illustrations for a book written by his sister, Mary Augusta, *On a Pincushion and Other Fairy*

*Tales*. By 1864 he had set up an establishment to design and produce stained glass, and six years later he turned to the art, or craft, to which he gave most of his life—ceramics. His experiments in lustre resulted in a blue burned-on earthenware, pottery and tiles, prized by connoisseurs. Rather curiously, his artistic interests were combined with a utilitarian bent of mind. He perfected and marketed a smoke-consuming grate, a duplex bicycle gear, and other devices. Neither from these nor from his pottery did he amass wealth.

When recovering from a severe illness, in 1904, he began to write, for his own amusement, a sketch which later expanded into *Joseph Vance: an Ill-Written Autobiography*, published in 1906. This was not intended as his own biography, as many persons have believed. It is said, however, that there is much of his personal history in *Alice-for-Short* (1907), his second novel. Throughout his books, De Morgan so obviously draws upon a rich recollection and experience of men and places, and is so prodigal of detail that each seems to reflect the author in a peculiarly intimate way. *Joseph Vance* took by storm a public supposed by most publishers to have been thoroughly weaned from everything so early Victorian in length and discursiveness. Mr. De Morgan was afraid at first that his obvious debt to Dickens would prejudice his success. His critics used this weapon, but he disarmed them by frankly admitting that he had steeped himself from boyhood in the work of his master. Readers all over the world acclaimed the resemblance, and yet found De Morgan essentially original. While it is human character, above all else, that attracts him, as it does Dickens, his humor has more than a dash of Charles Lamb, his pathos never becomes bathos, and his keen sense for the elemental flavors of "low" society never leads him to burlesque. His writing has a sly subtlety, a nice discrimination, a delicacy that is well fused with the robustness so characteristic of Dickens. He handles frankly his White-chapel personages, with a faithfulness in dialect and idiom that amazes, but he is equally famous for the attractiveness of his heroines.

He is not concerned with people who do great things in the world, nor, for the most part, with people who do very bad things. His *Somehow Good* (1908) is an absorbing social study and the best-knit of all his books, but it is not a "problem" novel. There is much of the mystic and psychic in De Morgan. One sometimes finds a skeleton in his closet, but oftener a ghost; and he seems to be able to create an atmosphere of emotional intensity by showing his characters guided or affected by unseen forces. Above all, his people are so real, so livable and human, as to persuade you that you have met them in some previous existence and shall meet them hereafter. Some of his men and women, and surely his children, have a perennial bloom upon them.

If one must record De Morgan's defects, they perhaps arise from the fact that he always wrote to please himself. He told his story in his own way, peppering it with coincidences, and interrupting it with tantalizing and digressive commentary. He was no Stevenson, laboriously cultivating a "style"; and, considering that his books sold by the hundred thousand, his readers did not wish him to change

his method, or acquire one. After *Somehow Good* came, the next year, *It Never Can Happen Again*, and in the year following that, *An Affair of Dishonor*. This latter was an historical romance, so different in subject and handling from the earlier novels, and so unpleasant, that De Morgan's admirers were aghast. *A Likely Story* (1912), historical and modern romance interwoven, utilizes as background the Italy that the author knew well through many sojourns. Its only moderate success is to be ascribed partly to the failure of its predecessor. In his last book, *When Ghost Meets Ghost* (1914) De Morgan returns to the field of homely, intimate chronicle in which he luxuriates. Here again are characters to be known and remembered. Consult: E. V. Lucas, *Outlook*, 90: 711-18, November 28, 1908; H. W. Boynton, *Nation* (New York), 89: 532-34, December 2, 1909; W. L. Phelps, *Essays on Modern Novelists* (New York, 1910); M. S. Gretton, *Contemporary Review*, 108: 511-20, October, 1915.

**DENMARK.** A kingdom (the smallest) of northern Europe, with a constitution dated July 28, 1866; consisting of the islands of Zealand, Fünen, Lolland, etc., the peninsula of Jutland, and the outlying island of Bornholm in the Baltic. Denmark is situated between 54° 34'—57° 44' N. lat. and 8° 5'—12° 40' E. long.; its present contracted dimensions being the result of the Dano-German war of 1864, which stripped it of the duchies of Schleswig-Holstein and Lauenburg. Denmark still occupied, together with Sweden and Norway, at the end of 1917, a neutral position in the War of the Nations (q.v.).

**AREA AND POPULATION.** The area and population by insular and mainland divisions, according to the census taken February 1, 1911, compared with the figures for population as estimated in 1916, are shown in the following table:

	Sq. miles	Pop. 1911	Pop. 1916
Copenhagen *	27	462,161	506,890
Baltic Islands.....	5,117	1,096,458	1,161,163
Jutland .....	9,898	1,198,457	1,258,809
Faroe Islands.....	540	18,000	19,617
Total.....	15,582	2,775,076	2,940,979

\* The capital city, without suburbs; with suburbs, 606,772.

Male population in 1916 (exclusive of Faroes), 1,415,822; female, 1,505,540. Urban population in 1916, 1,209,975 (1,109,726 in 1911); rural, 1,711,387 (1,647,350). The foreign-born population is less than four per cent of the whole. Living births in 1915 numbered 70,190; stillbirths, 1773; deaths, 37,175 (surplus, 33,015); marriages, 18,987. Of the births, 11.67 per cent were illegitimate.

During the year 7875 emigrants—3911 men, 3058 women, and 906 children—left Denmark for foreign lands. Of this number, 4305 were Danes, 649 Swedes, and 2921 of other nationalities. Of the total number leaving Denmark 7595 went to the United States.

**EDUCATION, ETC.** Primary education is free and compulsory between the ages of seven and fourteen. The schools are maintained by local taxation. Secondary schools, when not maintained by the state, are state-aided. Special schools, notably horticultural and agricultural, are state-aided. There is a university at Copenhagen. The established religion of Denmark

is Lutheran, which was introduced as early as 1536, the church revenue being at that time seized by the crown, to be delivered up to the university and other religious and educational establishments.

**PRODUCTION.** Nearly one-half the population live exclusively by agriculture, and one-fourth by manufactures and trade. The common products are wheat, rye, oats, barley, potatoes, cattle, horses, pigs, sheep, and butter. Its manufactures are, for the most part, for home consumption. Its principal imports are coal, manufactured goods (woolens, silks, cottons), iron, hardware, wine, fruit, tea, corn, and colonial produce. In 1908, 2,871,590 acres were under grain crops and 3,103,519 permanent pasture. The tables below give area (in hectares) and production (in quintals) of main crops, with yield per hectare in 1916:

	Hectares		
	1913	1914	1916
Wheat .....	54,044	54,044	61,186
Rye .....	245,786	245,786	194,045
Barley .....	241,409	241,409	255,995
Oats .....	428,387	428,387	430,979
Beets * .....	32,370	30,900	31,478
Potatoes ....	61,141	61,141	64,360

	Quintals			
	1913	1914	1916	Qs.
Wheat .....	1,822,078	1,279,178	1,640,000	26.8
Rye .....	4,819,513	4,788,294	2,740,000	14.1
Barley .....	5,966,184	4,974,452	5,330,000	20.3
Oats .....	8,290,168	6,729,225	7,500,000	17.8
Beets * .....	9,300,077	6,018,361	7,860,529	...
Potatoes ....	10,697,378	9,456,627	6,740,266	...

\* Sugar beets.

As much of the rye is suitable only for feed, it is estimated that 150,000 tons of wheat and rye will have to be imported before the next harvest. The difficulty in obtaining supplies has made it necessary for the government to permit the use of 20 per cent of barley meal in the manufacture of rye flour.

At present the use of wheat and rye as feed is strictly forbidden. The imports of corn are about 500,000 tons yearly. All the corn, rye, and barley used by the breweries and distilleries must be imported. These establishments use about 7 per cent of the total importation of corn and about 4 per cent of the domestic rye.

With the most efficient agriculture in the world, this country is devoted almost exclusively to crops and herds. Denmark not only obtains the highest average results per acre in the cultivation of the soil, but also uses the agriculture production as raw material for a national industry in further manufacture. It is in the finished form of butter, cheese, and other food products that contain more labor value and less raw material that Denmark exports the output of its agricultural and herding industry. Two-thirds of the population are engaged in agricultural pursuits or in handling the products.

To farmers Denmark makes loans secured by mortgages on property. The loans run for long terms and bear a low rate of interest,  $4\frac{1}{2}$  to 5 per cent. During 1916, 565 farmers borrowed sums totaling \$1,000,000. This is a larger amount than for the past few years. Since the inauguration of state loans to the agricultural classes in 1899, there have been 8200 loans, amounting to \$11,000,000. In 1909 a law was

passed allowing the farmers to borrow more on account of the increased valuation of the land and improvements made, and 3103 have availed themselves of the opportunity and obtained a total of \$1,600,000 since that time. During 1916 794 received additional advances amounting to \$300,000.

Hogs slaughtered during 1916 show a decrease of 11 per cent, from 2,426,000 in 1915 to 2,150,000 for the past year. Early in 1916 the killings were more than usual, but later decreased much below normal. The hog industry is declining because of the difficulty in obtaining feed and the maximum price set for the home market. The export of pork products is also limited to a fixed amount and must be made through licensed shippers.

In normal times Denmark is a large exporter of hides, but during the past two years an embargo has been placed on their shipment. Salted calfskins, however, weighing not over eight kilos and dried calfskins weighing not over four kilos have been on the export list. Notwithstanding the restrictions, prices of skins have reached an unprecedented height.

A comparative live stock table follows:

	Feb. 20, 1917	Feb. 29, 1916	May 15, 1915
Stallions, 3 yrs. & over	4,948	4,957	4,465
Horses, 3 yrs. & over...	184,062	177,216	177,763
Mares, 3 yrs. & over...	222,450	215,372	214,178
Young animals, 1-3 yrs	80,163	83,202	92,075
Colts and fillies under 1 yr. ....	46,772	84,668	87,209
Bulls & oxen over 1 yr.	182,767	186,786	156,153
Cows, 1 yr. and over...	1,140,649	1,141,246	1,281,182
Heifers, over one yr...	375,108	373,124	367,243
Calves, under one yr...	744,329	638,840	611,948
Sheep .....	267,979	254,368	533,084
Pigs .....	1,980,727	1,983,255	1,918,627
Poultry .....	8,247,698	.....	.....

Industrial establishments number about 82,500, with approximately 346,000 workers. Distilleries, 22, with 14,623,000 liters output. There are no later available statistics for creameries in operation than those for 1911, which returned 681, with 104,557 employees.

The sale of all alcoholic beverages has been prohibited since March 1, 1917, a temporary order, calling for returns on all stocks of spirits in the country. The bread card system, introduced April 1, 1917, fixes the daily allowance at 315 grams.

Industries are not permitted to keep going past certain hours, and city gas companies gave notice that they would have to shut down. Municipal governments have begun to enforce strict economy in the use of gas and electricity. Copenhagen, for over three months, was in darkness at night. The trade in coal is strictly regulated, as in wheat, butter, sugar, etc. The use of gas for heating water for washing and bathing is illegal. Candles are used for light in the houses. Anybody using gas or electricity beyond a certain maximum even for the "legitimate" purposes is penalized by paying five times the regular price upon the excess. Street cars run on a reduced schedule. The weather has been favorable to early farm work. A difficult problem is the obtaining of sufficient farm help. The Department of Agriculture has asked the cooperation of the War and Commerce departments to arrange the military maneuvers and the activities of the

neutrality guard, so that farmers and their horses will remain at home during the busiest part of the crop season, and to have organized industry and public works loan labor for the farms at these periods. The railroads and shipping lines will be directed to give special attention to the transportation of fertilizers. Cultivation of bogs and waste land is planned for. It is expected that the government will temporarily commandeer land for a period of three years in localities contiguous to large centres of population in order that people may cultivate potatoes and other vegetables, using time not otherwise employed. Cheap loans or contributions of seed, fertilizers, etc., will probably be made.

The egg market has been highly influenced by the war. Denmark imports in ordinary times large quantities of eggs of an inferior quality from Russia and exports the fresh article to Germany and England. During 1916 all imports stopped, and the kingdom was forced to supply home needs and continue exporting entirely from the domestic supply.

Fishing interests prospered during the year, and thirteen new companies with a paid-up capital of \$1,500,000 were formed to engage in the deep-sea fishing. The boats used, of fifteen tons and over, are propelled by motors.

With recent fluctuations of price, it is difficult to estimate the value of Danish fisheries. Probably £1,000,000 is as near as possible to the proper figure in peace time—the industry employing about 20,000 men. Since the war began, however, the demand from Germany has been very great, resulting in unprecedented prices. The increases are as follows: 1913, £970,000; 1914, £961,000; 1915, £1,473,000, and 1916, £3,210,000. About half the quantity comes from the Skager Rak, Cattegat, and the Baltic; the other half from the North Sea and the inland fjords. In four years the increase in value is nearly 400 per cent, against which the cost of production cannot be much greater than before, for the Danes use little material beyond their own labor in fishing. In peace time the plaice is the chief product, but, stimulated by the big demand for the haddock from Germany, the Danes have fished the eastern banks of the North Sea, which are now full of these fish owing to no British trawlers having fished there for three years. In 1915 the value of haddock landed by the Danes from these waters was under £100,000, but last year this had increased to nearly £900,000. After haddock the chief kind of fish landed is herring, mostly from the Baltic. Last year £700,000 worth were sold, against £260,000 in 1915. Eels, a fish greatly prized in Germany, produced £400,000, mostly from the inland waterways. The value of the plaice landed was nearly up to the figures for 1915, which were £400,000. Codfish brought in £480,000, compared with a value of £220,000 in 1915.

The chief hindrance to the industrial development of Denmark has been the lack of coal deposits. Denmark produces no coal and is therefore placed at a competitive disadvantage. The country's industries and railways consume annually about 3,000,000 tons, most of which comes from England and Germany. A Danish syndicate was formed in 1916 to investigate and exploit the coal fields of Iceland. During the past two years the country desired to purchase

coal from the United States, but freight rates prevented.

**COMMERCE, ETC.** Economic conditions in Denmark in 1916 were influenced by the war both for the better and for the worse. Prosperity was general, although business in many lines was curtailed and the kingdom was placed on the "ration basis."

Trade has been diverted into new channels during the war and the same policy may maintain when peace comes. The increase of commerce with the United States has been especially marked, and exports to that country have shown a steady growth. Excessive freight rates have militated somewhat against imports and exports. Cable communications are hampered and mails are delayed. The transaction of foreign business has become difficult and the government has been obliged to import for its own account foodstuffs and provisions. The "barter and sale" system has again come into use and merchandise is paid for by the exchange of other goods needed in the kingdom, which is practically bare of raw materials.

The general and special trade was as follows (in kroner):

	1910	1912	1914
<b>Imports:</b>			
General ...	634,407,000	817,512,000	795,288,000
Special ...	577,166,000	740,015,000	717,787,000
<b>Exports:</b>			
General ...	548,074,000	682,082,000	867,446,000
Special ...	485,374,000	596,723,000	730,226,000

Principal articles of trade with the United Kingdom are given below with values in thousands of pounds sterling:

	1914	1915		1914	1915
<b>Esps. to U.K.</b>			<b>Imps. from U.K.</b>		
Butter ...	11,089	10,221	Coal .....	2,207	2,582
Eggs ....	2,547	1,864	Cottons ....	580	849
Bacon ...	9,936	9,129	Iron mfrs...	354	385

The chief articles of import from all countries in 1914 are as follows, values in thousands of kr.: Cereals, 86,466; oilcake, 59,835; fuel, 59,633; wood, 33,102; iron mfrs., 27,502; veg. fibres, 24,007; iron, 19,561; animals, 17,842; woollens, 16,975. The chief articles of export: Butter, 213,018; meat, 205,443; animals, 160,534; eggs, 36,246; skins, 18,663; fish, 11,720; barley, 11,276; ships, 5439; iron mfrs., 3451.

Principal countries of origin and destination, general trade, values in thousands of kroner:

	<b>Imports</b>		<b>Exports</b>	
	1914	1915	1914	1915
Germany .....	264,653	328,308	301,424	178,694

Denmark, with other neutrals, has not escaped severe maritime losses since the war began. It is estimated that 85 Danish vessels of 66,000 net tons have been sunk, yet the total registered tonnage was 797,000 in 1916 as against 770,000 in 1914. New capital amounting to \$15,000,000 was invested in shipping in 1916, and old companies increased their cap-

ital by \$3,500,000. In 1913 the net earnings amounted to \$2,800,000 and in 1916 to \$40,000,000.

Vessels entered in the 1915 trade, 29,758, of 4,147,585 tons; cleared, 30,489, of 1,412,671. Merchant marine (January 1, 1915), 3666 vessels of 587,566 tons. Railways in operation at end of 1915, 2375 miles (1262 state owned); state telegraph service (1916), 2302 miles; telephone wires, 366,403.

**FINANCE.** Revenue and expenditure for comparative years are shown below, in kroner; A—receipts and expenditures current; B—receipts from investments and funding of debt, and expenses for improvements on domains and reduction of debt:

	1913-14	1914-15	1915-17
Rev. A .....	123,874,961	121,780,782	166,087,098
Rev. B .....	4,209,088	84,894,354	17,987,898
Exp. A .....	111,404,448	156,180,163	121,023,942
Exp. B .....	12,185,641	16,457,920	20,161,032

The budget for 1917-18 shows revenue, 163,184,096 kr.; expenditure, 120,628,437. The debt stood, March 31, 1916, at 465,052,521 kr. See **FINANCIAL REVIEW.**

**GOVERNMENT.** Under the constitution of 1849 (modified in '55, '63, '65, '66, and 1915), the executive power is vested in king and ministers, the legislative in the Rigsdag or Diet acting jointly with the sovereign. The Rigsdag is composed of the Landsthing (or upper house of 72 members—12 crown nominees appointed for life, and 54 indirectly elected for eight years by electoral bodies, in which large taxpayers are well represented) and the Folkething (or lower house of 140 members directly elected by universal suffrage for four years). Members of both houses are paid about ten kroner a day while the Rigsdag is sitting, and their traveling expenses. The Rigsdag must meet every October, and all money bills must be submitted first to the Folkething. For local government the country is divided into eighteen counties, each under a governor, and these are subdivided into hundreds and parishes. The towns are administered by mayors. Reigning sovereign, Christian Charles Frederick Albert Alexander William, born September 26, 1870; married April 26, 1898, to Alexandrine, Duchess of Mecklenburg (born December 24, 1879); proclaimed king (Christian X) May 16, 1912, upon the death (May 14) of his father, King Frederick VIII. Heir-apparent, Prince Christian Frederick Francis Michael (born March 11, 1899).

King Frederick VIII was born June 3, 1843, and succeeded his father, King Christian IX on the death of the latter, January 29, 1906. He married, July 28, 1869, Princess Louisa, daughter of King Carl XV, of Sweden and Norway, and had seven children. His second son, Prince Karl, born August 3, 1872, was married to Princess Maud of Great Britain, July 22, 1896, and was in November, 1905, elected king of Norway as King Haakon VII. King Frederick was a brother of Queen Alexandra, of King George I of Greece, and of the once Dowager Empress of Russia.

The Danish cabinet ministers, December 1, 1917, were as follows: Carl Theodor Zahle, President of the Council and Minister of Justice (date of appointment, June 21, 1913); Erik

Scavenius, Foreign Affairs (June 24, 1913); Jens Chr. Christensen, Minister without portfolio (September 30, 1916); Christopher F. Hage, Commerce (March 20, 1916); Dr. Phil. Edvard Brandes, Finance (June 21, 1913); Dr. Phil. Peter Munch, Defense (June 21, 1913); Søren Keiser-Nielsen, Public Instruction (June 21, 1913); Kristjan Pedersen, Agriculture (June 21, 1913); Ove Rode, Interior (June 21, 1913); Jens Hassing Jørgensen, Public Works (June 21, 1913); Thorvald V. Povlsen, Ecclesiastical Affairs (April 28, 1916); Christian Michael Rottbøll, Minister without portfolio (September 30, 1916); Thorvald A. M. Stauning, Minister without portfolio (September 30, 1916); Jøn Magnusson, Minister for Iceland (January 4, 1917); Björn Kristjánsson, Minister for Iceland (January 4, 1917); Sigurdur Jonsson, Minister for Iceland (January 4, 1917).

**DENNEY, JAMES.** A Scottish Free church theologian and New Testament scholar, born in Paisley in 1856, who died on June 12, 1917. He was educated at Glasgow University and at the United Free Church College, where, after eleven years (1886-97) as pastor in Broughty Ferry, he became professor of New Testament language, literature and theology. His exegetical and theological works include: *The Epistle to the Thessalonians* (1892) and *Second Corinthians* (1894) in the "Expositor's Bible;" *Studies in Theology*; *The Epistle to the Romans* (1900) in the "Expositor's Greek Testament," probably his most important commentary; *The Death of Christ* (1902); *The Atonement and the Modern Mind* (1903), perhaps his greatest theological work; *Jesus and the Gospel*; *The Way Everlasting*, a volume of sermons.

**DE PAUW UNIVERSITY.** A co-educational institution under the auspices of the Methodist Episcopal Church at Greencastle, Ind. In the fall of 1917, there were 662 students in the College of Liberal Arts and 184 students in the Music School; also 36 members of the College faculty and 9 members of the faculty of the Music School. Volumes in the general and departmental libraries numbered 33,000. Productive funds in 1917 amounted to \$1,343,477 and the income therefrom, \$56,804. Rector Hall, a dormitory for women, was erected during the year by Mr. Edward Rector of Chicago, as a memorial to his father, a former trustee. A new administration building, Clem Studebaker Memorial, was also erected in 1917 by members of the Studebaker family as a memorial to their parents. De Pauw was founded in 1837. President, George Richmond Grose, LL.D.

**DESTROYERS, TORPEDO BOAT.** See **BATTLESHIPS, ETC.; NAVAL PROGRESS; SUBMARINE OPERATIONS; SUBMARINES; UNITED STATES AND THE WAR.**

**DEWEY, GEORGE.** A famous American naval officer, died in Washington, D. C., January 16, 1917. He was born in Montpelier, Vt., December 26, 1837, the son of a physician, Dr. Julius Y. Dewey. The family traced their descent from Huguenots named Douai, in the sixteenth century, through Thomas Duce, a Dissenter, who came to New England in 1630. One ancestor fought in King Philip's War, and another was a minute man at the battle of Lexington. George Dewey was sent as a boy to Norwich Military Academy, and expected to go from there to West Point. But when he was ready there was no vacancy, and he accepted instead an appoint-

ment to the lately established Naval Academy at Annapolis. Graduating fifth in his class of fifteen in 1858, he was assigned to the steam frigate *Wabash*, flagship of the Mediterranean squadron, and in 1861, as lieutenant, was transferred to the *Mississippi*, in Farragut's fleet. Of this vessel he was executive officer when, after helping to force the forts below New Orleans in the spring of 1862, the fleet ran the batteries at Port Hudson. Dewey was commended for the coolness he showed when the *Mississippi* grounded and had to be abandoned. He was next assigned to a patrol gunboat on the *Mississippi*, and in 1863 was transferred to the *Agawam*, which was helping to maintain the blockade along the Carolina coast. He participated in the attack on Fort Fisher.

When a lieutenant commander, Dewey was married to Miss Susie Goodwin, daughter of a former governor of New Hampshire, in 1867. She died in 1872, after giving birth to a son. Between this time and the Spanish-American War, the young naval officer, who had already been abroad for several years on the *Colorado*, saw varied service, much of it ashore as lighthouse inspector, secretary of the Lighthouse Board, chief of the Bureau of Equipment and Lighting, and chief of the Board of Inspection and Review. Under the system of slow promotion then operating, he became commander in 1872 and captain in 1884, when he was placed in command of the *Dolphin*, then a dispatch boat and one of four vessels comprising the original white squadron. By 1896 he had been promoted commodore.

In Dewey's appointment as commander of the Asiatic fleet, received in January, 1898, Theodore Roosevelt, then Assistant Secretary of the Navy, had a share. At his suggestion Dewey asked Senator Proctor of Vermont to urge his claims against the influence of Rear Admiral Crowninshield. With the *Olympia* as his flagship, Dewey took command of a squadron of four protected cruisers and three gun-boats. He found himself short of coal and ammunition, and distant some 7000 miles from a base—and he knew trouble was coming. After purchasing two British colliers, he moved away from Hongkong, and when war was declared set out from a small Chinese harbor for Manila, about 600 miles away, where he knew there was a Spanish fleet under Admiral Montojo. His orders were to "capture or destroy" the enemy's force. He entered Manila Bay at daybreak May 1, and soon afterward, with the *Olympia* in the lead, went into action against the eight Spanish vessels. The American fleet kept close together, and made five runs, each of about two miles. Between 5:40 a. m. and noon the Spanish squadron was annihilated and the batteries at Cavite and Sangley Point were silenced—and all without the loss of a man to the attacking force. Dewey's order to Captain Gridley of the *Olympia*, "You may fire when you are ready, Gridley," opened the action and became famous.

In retrospect, Admiral Dewey's conduct after the battle was quite as important as the engagement, if less spectacular. During the four months that he remained in the bay, blockading the city, and waiting for much needed reinforcements, he had a delicate situation to face. Until the army was ready to cooperate, Manila could not be taken and held against the Spanish army. A number of nations had interests in

the Philippines, and at one time there were British, French, Japanese, and German warships in the roadstead. In the case of Germany, at least, territorial ambitions seemed to be indicated by the sending of a fleet out of all proportion to the commercial interests involved. This fleet flagrantly transgressed the rules of the blockade, and finally its commander, Admiral Von Diederichs, had to be brought up short by Dewey, who successfully cleared up a difficult international situation without appeal to Washington. Throughout the controversy, Captain Chichester, the British commander, upheld Dewey.

When it became known that Admiral Camara was on his way from Spain, the American position seemed to be anything but secure. Somewhere in the Pacific were two monitors on their way to Manila, but most of the fleet was in Cuban waters. However, Camara was recalled, and the defeat of Cervera's fleet at Santiago released a number of American vessels for other service. Meanwhile General Merritt prepared to attack Manila, and on August 13 he did so, while the American fleet fired on the forts. The city was captured on the day after the signing of the peace protocol, as later appeared. The cable had been cut, so news of the war's end did not reach Manila till August 16.

When Dewey returned to the United States, after a trip through the Mediterranean, he reached New York, September 26, 1899, and found waiting him a popular welcome unparalleled in American history. The events included a naval review in the North River, receptions, and a great parade which passed through the Dewey triumphal arch at Madison Square. A sword of honor was voted him by Congress. Afterward, it was proposed to erect and furnish a house for the naval hero wherever he might choose, the funds to be raised by popular subscription. Fifty thousand dollars was collected and a house made ready in Washington. Less than two months after he had landed in New York, Dewey married Mrs. Mildred McLean Hazen of Washington, and soon afterward he deeded to her the house given to him. This action, taken, it was said, because the couple preferred to live in Mrs. Dewey's home, raised a storm of indignation that only died down gradually. Immediately after news of the victory at Manila reached home, Dewey had been promoted rear admiral and had been thanked by Congress. On March 2, 1899, he was appointed admiral of the navy. The rank of admiral had been held before in the United States only by Farragut and Porter. In the same year he was made a member of the United States Philippine Commission. From 1900 till his death Admiral Dewey served as president of the General Board of the Navy. At his own desire, he was retained in active service long after passing the age limit. He went regularly to his office in the Navy Building, and his advice was considered to be of the highest benefit to the department. Although an exponent of the larger navy, which should be second to none in the world, he was never a critic of the quality of the American navy. He advocated the continued building of large battleships, and had lately called attention to the services rendered by such vessels in the battle of Jutland. In 1901 he acted as president of the court of inquiry which examined into the famous Sampson-Schley controversy, and he brought in

a minority report, crediting Schley with the victory at Santiago.

Dewey was buried January 19, 1917, in Arlington National Cemetery with the highest public honors. After a private funeral service at his home, and a simple but impressive service in the rotunda of the capitol, attended by the most distinguished personages in Washington and conducted by the Rev. J. B. Frazier, who was chaplain of the *Olympia* at Manila Bay, the body was taken under military and naval escort across the city and the Potomac to Arlington. As an extraordinary mark of honor, Secretary Daniels directed that all officers of the navy and marine corps should wear mourning with their uniforms for thirty days. Consult for much interesting material Dewey's *Autobiography*, published in 1913.

**DIAMOND JIM.** See BRADY, JAMES BUCHANAN.

**DIARSENOL.** A proprietary preparation of arsenphenol-amine hydrochloride. This drug has the same action and uses as salvarsan (q.v.) and has been extensively used since the supply of the latter drug was shut off by the war.

**DICKINSON, DONALD McDONALD.** An American lawyer and politician, popularly known as "Don" Dickinson, died at Trenton, a suburb of Detroit, October 15, 1917. He was born at Port Ontario, Oswego Co., N. Y., January 17, 1846, was taken with his parents to Michigan in 1848, and graduated at the University of Michigan in 1867, after which he was admitted to the bar. He also began to take an active part in the politics of the Democratic party. He was elected chairman of the Democratic State Committee in 1876; and in 1880-85 he was a member of the Democratic National Committee. In President Cleveland's first administration he was postmaster-general in 1887-89, and in 1892 he was chairman of the Democratic National Campaign Committee. He had already become a lawyer of national reputation. He was senior counsel for the United States before the International High Commission on Bering Sea Claims, under the Fur Seal Arbitration (1896-97), and in 1902 was a member of the Court of Arbitration to settle the controversy over port duties between the United States and the Republic of Salvador. He had been president and a trustee of the Detroit Museum of Art.

**DIESEL ENGINE.** See INTERNAL COMBUSTION ENGINES.

**DIPLOMATIC SERVICE.** See UNITED STATES.

**DIBIGIBLES.** See AERONAUTICS.

**DISASTERS.** See FIRE PROTECTION.

**DISCIPLES OF CHRIST.** The total membership of this denomination, which began to develop early in the nineteenth century, and which is known as Disciples of Christ or Churches of Christ, or the Christian Church, and including both the radical and conservative elements, embraced in the year 1917, about 11,200 churches, 1,375,000 members, and 8500 ministers. They rank fifth among the Protestant bodies of the United States. The strength of the denomination lies largely in the Ohio-Mississippi Valley States. It is one of, if not the leading communion of Christians in the States of Kentucky, Indiana, and Missouri; Illinois, Iowa, Kansas, Nebraska, and Texas are largely represented also. In 1917 more than \$2,000,000 was raised for missionary purposes.

One of the most significant features of their

work is the Men and Millions Movement. This was an enterprise inaugurated four years ago and has a threefold purpose. First to secure a fund of \$6,300,000 by individual gifts to equip the mission stations at home and abroad and to increase the endowment of the educational and benevolent institutions. Second, to enlist 1000 volunteers for the mission field. Third, to establish in every church in the brotherhood the every-member canvass as the best plan for securing from every member of the church an offering on the first day of every week for the support of the local church and the extension of the Kingdom in all the world.

The proposed fund of \$6,300,000 is to be over and above the regular income of the eight missionary boards and the twenty-six colleges. One man in the communion subscribed \$1,000,000 on the condition that \$5,300,000 additional be secured. The gifts are all to be paid up within five years. The Disciples have now secured almost \$5,000,000 in pledges and will finish the task on June 1, 1918. The president of the General Convention, which meets annually to promote unity, economy, and efficiency among the philanthropic organizations of the church, is Judge J. N. Haymaker, of Wichita, Kan.; the secretary is Robert Graham Frank, of Liberty, Mo.

**DISTILLED LIQUORS.** See LIQUORS.

**DITHMAR, EDWARD AUGUSTUS.** An American journalist and dramatic critic, died in New York City, October 16, 1917. He was born May 22, 1854, and after a grammar school education began his newspaper career on the *Evening Post* at the age of seventeen. He was first employed on the *New York Times* in 1877, and continued in the service of that newspaper for forty years successively as dramatic critic, London correspondent, editor of the *Review of Books*, and editorial writer. Appointed while editor in 1882, he became dramatic critic two years later and soon attracted attention by the fairness of his criticisms at a time when the different points of view from which a play might be considered were upheld by different classes of writers with much vigor of dramatic partisanship. Dithmar valued a play according to its effect upon the audience, regardless of traditional rules of the stage and the reputation of the actor. His wide knowledge of dramatic literature and theatrical history was shown in the many articles on celebrities of the stage which he wrote in collaboration with other noted critics. He was largely instrumental in bringing into public recognition the dramatic talent of Clyde Fitch. In 1901 he became London correspondent for his paper, remaining in that position for a year and returning to become editor of the *Times' Saturday Review of Books*. He became one of the editorial writers in 1907, and the latter part of his work was specially devoted to city affairs. He edited the *Memoirs of Augustin Daly* and wrote: *John Drew, a Biographical Sketch* (1900).

**DOBRUJA.** An eastern division of Rumania, bounded on the east by the Black Sea and on the north and west by the Danube River. It consists of Constantza and Tulcha (Tulcea) departments, which have an aggregate area of 5998 square miles and, according to the census of January 1, 1913, a population of 380,430. The population has a strong foreign element, including Turks, Bulgars, Tatars, Russians, and Ger-

mans. The larger towns are the seaport Constantza and Tulcha, which prior to the great war had 27,622 and 22,186 inhabitants respectively.

**DOCKS AND HARBORS.** The conditions of commerce and the necessity of over-seas transportation of men and materials for participation in the great war, brought the importance of the harbors, docks, and warehouses of the Atlantic seaboard into prominence as never before. It was stated that inasmuch as about 80 per cent of the Atlantic foreign trade usually passed through the Port of New York, for that reason various other American ports had not been able to develop or receive an adequate measure of attention. However, one of the first conditions realized in connection with the war, was not only the inadequacy of the Port of New York, even with added and proper terminal improvements, but the necessity for considering other points along the Atlantic and Gulf seaboard for the vast commerce required by the war, and which it was hoped in large part would be retained in later times of peace. In view of the centralized control of national exports at Washington, and the decision for government operation of the railways, it was realized that there would be a much wider distribution of export commerce than ever previously. Furthermore, with the vast tonnage that was being promised by the Shipping Board to amount to some 14,000,000 tons by 1919, it was realized that American commercial interests must arrange at once for adequate dock and harbor facilities. In fact, the ports of the United States, though offering excellent harbors and other natural advantages, as regards developments, were far behind those of Europe, and the facilities for shipment and for connection with inland railway systems were far from adequate. The government soon after the outbreak of war began to commandeer warehouses at the larger ports, and it was believed that this process would continue until a national organization, fully equipped and efficient, was developed. In this connection a notable paper describing the condition and the proposed method of getting supplies to the war as developed by the War Industries Board Storage Committee, was presented before the annual meeting of the Academy of Political Science in New York on December 14, by Francis Lee Stuart, a consulting engineer who was chairman of the Terminal Ports Facilities Committee, a part of the Storage Committee of the War Industries Board.

**NEW YORK AND NEW JERSEY PORT DEVELOPMENT.** The New York and New Jersey Port and Harbor Development Commission was appointed in 1917 after legislation by the legislatures of the two States. This action was taken in order to secure proper coordination and cooperation in the development of the port of New York, considering it as a unity rather than as a matter for State rivalry. It was further planned to gain the assistance and cooperation of the Federal government, and while the functions of the commission were designed for times of peace rather than war, yet it endeavored to aid in an immediate attempt to coordinate the many branches that were being carried on in the harbor and the immediate vicinity. William R. Wilcox was chosen chairman of the commission, General George W. Goethals, the builder of the Panama Canal, was chief consult-

ing engineer, and Julius H. Cohen was the counsel of the commission.

The vast increase in exports required by the Allies and the American forces in Europe, as well as the actual transportation of American troops, presented a number of difficult problems at the Port of New York, and a special War Board was created with Irving T. Bush, president of the Bush Terminal Company, at its head. New conditions rendered imperative the improvement of various waterways around the city, and both the Secretary of War and Navy urged the Rivers and Harbors Committee of the House to make provision for the deepening of the Hell Gate Channel to forty feet. Such action was required not only from a commercial but from a naval necessity, in order that the largest battleships could utilize Long Island Sound in reaching the Brooklyn Navy Yard. In this connection it was also proposed that the entire Upper Bay of New York Harbor should be dredged to a depth of thirty-five feet and that every foot of shore front should be made available. This would involve the removal of Robbin's Reef and dredging an area 4000 yards wide and five miles long, giving access to the New Jersey shore.

**BAYONNE TERMINAL.** The project for a large terminal port and warehouse at Bayonne, N. J., on the lines of the well-known Bush Terminal at Brooklyn, N. Y., was defeated on July 31 when the citizens of Bayonne by a vote of 3408 to 1075 refused to sanction the issue of \$10,000,000 of bonds for the combined warehouse and terminal port which was to be leased to the Bush Terminal Company for operation for 50 years.

**A FREE PORT AT NEW YORK.** In December, the United States Tariff Commission held hearings in the City of New York at which special attention was given to the establishment of a free port or free zone at that city. This was an entirely new proposition and came as a part of the scientific thought and treatment of external commerce that was beginning to be made. There had been no free ports or free zones in ports in the United States into which foreign material might be imported free of duty, and there stored, assembled, repacked, manipulated, or manufactured, without custom house inspection, charge, or interference. These materials at the convenience of the business plans of the owners, after such treatment could be reloaded or reshipped as desired, but of course if passing into the ordinary commerce of the country would be subject to the ordinary customs inspection and charges.

In the United States bonded warehouses had been the only facility of this kind, but with the development of foreign commerce, it was believed that the establishment of a free zone would relieve congestion of the piers and appraisers' stores and would simplify the formalities depending upon bonding and drawbacks in the case of reexported goods. Furthermore, in the free zone, the owner would have at all times absolute control of his merchandise, and free access to his goods, while manufacturing could be carried on and show rooms established. The free zone would furthermore release capital tied up, and add to the more rapid movement of ships and cargoes.

Another argument for the creation of a free zone was that it would involve the building of

large specialized terminals with dry docks, repairing and shipbuilding facilities, and would develop materially the position of the United States in foreign markets. It was believed that this proposition for New York and other American ports would receive the favorable consideration of the New York Chamber of Commerce and other commercial interests. The oldest example of a free port in the world was that of Hamburg, Germany, where the zone devoted to such trade and industry now occupies a large area.

Commercial interests on the Pacific coast also advocated the establishment of a free port at San Francisco, advancing virtually the same reasons as were suggested for a free port at New York, but with the appropriate application to Pacific trade.

**MOBILE MUNICIPAL DOCKS.** The citizens of Mobile, Ala., voted on August 13 to authorize the City Commission to arrange a bond issue of \$600,000 for the construction of a municipal water terminal. The project comprised concrete wharves, piers, and bulkheads, railroad connections to the water front, and dredging to a depth of thirty feet. Warehouses were also included in the design but would require a further appropriation. Previously in the year it had been announced that the first unit of a water terminal for the Gulf Mobile and Northern R. R. at Mobile, Ala., was to be commenced. This unit was to consist of a pier and slip large enough for several ships, and a series of warehouses, aggregating some 4000 lin. ft. of berthing space and 2000 lin. ft. of warehouses, some of which would be five or six stories high. Another unit of double the capacity of the terminal and also 2000 lin. ft. of lumber docks were also contemplated.

**BALTIMORE AND OHIO PIERS AT BALTIMORE.** At pier No. 5 at the Locust Point terminal at Baltimore of the Baltimore and Ohio Railroad, an automatic car-loading machine with electric weighing devices was installed whereby the loads could be delivered direct to the cars by means of a conveyor, so that the continuous use of a switch engine and crew for spotting involved an electrically operated car loader with belt conveyor and receiving hoppers, and could be used with ore, sulphur, clay, coal, and other bulk commodities, loading either box or open cars with equal facility. Three tracks on the pier, which is 800 ft. long, can be used in connection with this conveying system whose elements consist of a receiving hopper, the car-loading machine, and a conveyor, which are placed on the centre tracks so that the two outer tracks can be used for cars. The receiving hoppers which are mounted on standard trucks running on the centre track, receive the material from the hatches of the vessel along side, and transfer it to the main conveyor which is a 30-in. belt extending the entire length of the pier. The loading machine also runs on the centre track and has a loading arm and intermediate conveyor, the latter being movable in a horizontal plane through a swing of 270 degrees, while the loading arm has a horizontal movement through 270 degrees in addition to sufficient vertical movement to clear the side of the largest open car. There is a cabin on the latter for the operator, and an automatic weighing device so that the machinery can be adjusted not only to weigh but to supply the material

at any desired rate and at any desired amount.

During the year the Virginia Railway started work on an addition to the coal terminal at Sewalls Point near Norfolk. The improvement involved a car dumper, elevator, six conveyor cars, track scales, yards, and additional electrical equipment.

**PORTLAND, ORE.** On the Pacific coast, port development was active and on June 4, 1917, the city of Portland, Ore., voted to issue \$3,000,000 in bonds for the improvement of its port facilities, constructing an elevator with a capacity of 1,000,000 bushels in connection with a dock or warehouse approximately 1000 feet long and about 175 feet wide. The proposed plans involved pier and slip constructing, with a large open dock area for bulk material. The cost of the site and the immediate construction would require \$2,000,000 of the appropriation and the remainder was to be held in reserve for future requirements.

**GREAT LAKES.** In 1917, engineers and municipal authorities in cities on the Great Lakes had reached the conclusion that harbors in small rivers had become obsolete for modern traffic, and that large waterfront developments should be undertaken instead. This was particularly true in the case of Milwaukee, where a report was presented in favor of closing up the river to general traffic, restricting it simply to barges, and building a viaduct along each side of the river within the waterway with various bridges connecting. The river was crossed by numerous drawbridges which had become a hindrance to the street traffic of the city, while they really impaired navigation and did not permit of adequate dock facilities such as might be secured on the lake front. Any such improvements likely to be undertaken would involve model port construction and probably would require more capital than would be available until after the war.

There was, during 1917, a vast amount of port improvement either under way or contemplated on the Great Lakes. This was being executed by the United States government, by city and municipal authorities, and by various private corporations especially those interested in railway, shipping, or manufacturing. The more notable work of the year included at Chicago, the extension of the government breakwaters and the construction of two breakwaters to protect the City Municipal Pier. At Milwaukee, bulkheads or revetments on the lake shore north of the river and along Jones Island to protect the fill for reclaiming land on which municipal terminals might be located, were under construction and plans were developed for both the inner and outer harbors, although there was no complete plan for a comprehensive development. At Duluth and Superior, ore docks were being erected, while the port of Duluth-Superior was to be dredged by the government. At Ashland, Wis., a large ore dock was building for the Chicago and Northwestern Railway at a cost of \$1,000,000 in addition to other terminal work. The Soo Line was building a second ore dock, a concrete structure costing about \$1,500,000. At Duluth, a new wharf or bulkhead wall was being built by the Michigan Central Railroad with about 2½ acres of made land, two steamship companies cooperating in the work. This new structure extended to the harbor line for about 100 ft. beyond the former wharf. At Toledo, a

large coal and freight dock was under construction in connection with the power plant of the Toledo Railway and Light Company, while at Cleveland, the Cuyahoga River was being straightened. Important developments at Buffalo in connection with the deepening of the entrance to the outer harbor, and the construction of a stone and concrete superstructure on the former timber breakwater were the most important works. The Barge Canal terminals, which were to cost about \$11,000,000, involved the Erie Basin, with two new piers at which lake vessels and canal barges were intended to meet, and the Ohio Basin, where work was begun to provide harbor space for canal barges and access for lake vessels except those of the largest size. The Buffalo River was being deepened and enlarged upstream, a bascule drawbridge was installed on the railway, and bridges permitting the passage of large vessels.

A notable ore dock with steel and concrete, an unusual combination, was completed at Two Harbors, Minn., Dock No. 2 of the Duluth and Iron Range R. R. is 1368 ft. wide inside the pockets with top walks outside of the pocket and with its deck 80 ft. above the lake. There is a double row of pockets 114 on each side, holding 300 to 350 tons each. The pockets are 12 ft. long, so that trains of 24-ft. ore cars can dump into alternate pockets without shifting. In this ore dock, a superstructure has a frame of structural steel with free case and front walls of the bin, while the deck and the partition walls between the bins were of concrete which was poured into place. This work was further interesting in that a large amount of concrete was placed during the cold weather requiring artificial heat for the concrete, and also the protection for the work of construction, the temporary housing being built of four wooden ore cars and moved as required with the progress of the work. This interesting construction is described in the *Engineering News-Record* for August 9, 1917.

Another interesting ore dock on the Great Lakes was dock No. 5 of the Duluth, Messalie and Northern Railway at Duluth, Minn. This dock was 2304 ft. long and had 384 pockets of 300-ton capacity each, or a total capacity of 115,200 tons. The height from water to rails was 80 ft. 6 in. and the width of the dock was 56 ft.

CHICAGO. The notable 3000-ft. Municipal Pier for the city of Chicago, which has been described in a previous issue of the YEAR BOOK (see YEAR BOOK for 1915), was further improved by the construction of two breakwaters to protect ships docked along its exposed length. The government breakwater afforded partial protection on the north and east but there is so large an area that a considerable sea was developed at the pier. Accordingly the municipal government built to the south of the pier a rock-filled pile breakwater 2350 ft. long and was about to build a similar breakwater north of the pier 200 ft. long. These breakwaters not only will serve to protect the municipal pier, but were to form the dock walls of other piers and could be extended as required when additional commerce made such action necessary.

BUREAU OF YARDS AND DOCKS. In connection with the important developments in the United States Navy, Captain Charles Wellman Parks, Corps of Civil Engineers, U. S. N., was nominated on December 18, 1917, by President Wilson to

be Chief of the Bureau of Yards and Docks of the Navy, succeeding Rear Admiral Harris, who recently resigned to become general manager of the Shipping Board. Rear Admiral Parks had been in the service of the Navy Department for twenty years, and was the engineer for the construction of the large naval station at Pearl Harbor, Hawaii.

BRITISH EMPIRE. Late in the year, Lord D'Abernon, who was chairman of the Dominions Royal Commission, brought before the London Chamber of Commerce the necessity of improving the British harbors so as to afford facilities for ships of greater draught and to develop commerce by providing additional facilities. Lord D'Abernon suggested that the deepening of the harbors would involve an expenditure of about £4,000,000 to provide for vessels of 38 feet draught at practically all the important harbors of the mother country, the Dominion of Australia, and the Commonwealth of New Zealand by the Cape route. At the Port of London, he suggested that the first step would be the deepening of the Thames by increasing it to 30 feet at low water of ordinary spring tide, and other changes made in order to accommodate vessels of 38 feet. He proposed to increase the depth of water at the Princess Landing Stage at Liverpool at a cost of £500,000, while at Southampton provision was also made for ships of 38 feet draught. Thus with an expenditure of £1,000,000 the first-class English ports were to be made to take vessels of the required depth. He suggested further developments at Cape Town, Durban, Melbourne, and other ports in Australia and New Zealand.

The war did not interfere with the consideration of new dock and harbor schemes at Portsmouth, Plymouth, and Falmouth. It was believed that additional port facilities for ocean shipping were required on the southern coast, and at Portsmouth it was proposed to dredge an entrance channel to a depth of 35 feet at Langstone Harbor immediately to the east of Spithead. A tidal quay was also to be constructed and a large wet dock and graving dock. The estimated cost of the proposed works was stated at about £2,000,000. At Falmouth, which had been used by ocean liners as a port of call, it was proposed to develop commercial shipping facilities at St. Just on the eastern side of the harbor. Preliminary plans called for a pier 3000 feet long, three jetties affording a depth of water alongside from 36 feet to 42 feet, and two large graving docks 1200 feet and 1000 feet in length respectively. A connecting railway 12 miles in length would connect St. Just with the Great Western Railway system. The estimated expenditure was £1,300,000. At Plymouth a substantial addition to the merchant ship accommodations facilities in the form of deep water wharves, a pier, and a large dry dock, and in addition new warehouses were contemplated, and furthermore it was suggested that the various improvements and the various existing port authorities be merged into a Harbor Trust for Plymouth. The Plymouth and Falmouth schemes received the provisional approval of the Admiralty, and it was stated that no official objection would be made to the Langstone project.

FRANCE. In connection with the participation of the United States in the European War, considerable dock and harbor work were carried on both by France and by the United States

at the various ports at which the transports and other American shipping landed. This involved a considerable construction of docks and wharves, warehouses, and railway connections in order to insure the rapid transport of supplies. The rapidly increasing traffic at the Port of Rouen led to the approval of plans for certain necessary extensions involving the construction of an additional 6 kilometres of quays, the deepening of the bed of the river Seine as far as Rouen, the control of the water-course by the construction of dykes and quays, and dredging operations for maintaining the stream at the desired depth.

**THE NETHERLANDS.** A scheme was proposed during the year for deepening the waterways from Rotterdam to Dordrecht, forming a regular seaport at the latter town. The aim was to follow the arm of the Meuse which at the east end of the island of Rozenburg branches from the Rotterdam channel. The distance to Dordrecht is 27 kilometres and the channel would be deepened to permit vessels of 8 m. (26 ft. 3 in.) to proceed that far. The new channel would be from 200 m. to 260 m. with a narrow channel 100 m. broad,  $7\frac{1}{2}$  m. deep, the middle of which for a depth of 50 m. would be  $8\frac{1}{2}$  m. deep. The cost was estimated at 4,000,000 gulden or \$1,650,000. Whether this improvement would be undertaken in the near future or not was quite questionable as the use of the port of Rotterdam had diminished materially during the year and from 10,203 vessels in 1913 with a tonnage of 12,785,861, there had been a decline to 2979 vessels with 3,191,830 tons in 1916.

**SWEDEN.** Preparations were being made for a harbor at Käringsberget, forming a deep water port for Gothenburg. This new harbor would have adequate depth and it was proposed to construct quays 12 m. deep, amounting in the aggregate to 3400 m. (11,200 ft.) in addition to which there was 915 m. (3000 ft.) of quay with a depth varying from 4.8 m. (16 ft.) to 9 m. (29 ft. 6 in.). The cost of this project was estimated in excess of \$5,000,000. In Stockholm, a large harbor extension was under way, while other Swedish towns such as Malmö were extending their harbor facilities.

**CHILE.** During the year, the Chilean Embassy at Washington asked for public bids for the foundation work involved in the improvement of the Port of Antofagasta, which was the principal port of export for the sodium nitrate industry, a trade which was important during the war and which Chile was anxious to hold after its conclusion. The government proposed to spend about \$8,500,000 on this work, a loan having been authorized on September 4, 1916, for this purpose.

At Valparaíso, Chile, progress was made during the year on the harbor improvement, and especially in the construction of the breakwater at Punta du Pratt. This breakwater consisted of a shore section built of concrete blocks with a protective bank of pell mell blocks for the deep water section. This shore section was 165 m. long and extended outward from the shore to a depth of 18 m. The deep water section was 123 m. in length and extended from the depth of 18 m. to a depth of 57 m. at the outer end and consisted of a rubble mound on which were placed six monoliths built of reinforced concrete each 20 m. by 16 m. wide and 15 m. deep, the top being 1 m. above the water when set. These monoliths were built in a temporary dry dock from which they could be launched and after

being set they were filled completely with concrete, the gross weight of each being 13,370 tons.

**ARGENTINA.** During the year the new masonry basin at the military harbor near Bahia Blanca, Argentina, which was the largest in South America; was completed and successfully tested. Its principal dimensions were length, 183 m. (600 ft.), depth to the sill at the entrance, 9.75 meters (32 feet), width at the entrance, at the base, 35 metres (114 feet 10 inches), at the top 36.67 metres (120 feet 4 inches).

**BRAZIL.** The development of the Port of San Sebastian, in the State of São Paulo, Brazil, and the construction of a railway from that city inland to Campinas and Pouso Alegre, was a project under discussion during 1917. The San Sebastian Railway was to be about 350 miles in length of the Brazilian standard-gauge of 5 ft. 3 in., with a 20 mile section ascending the Serro do Mar with very steep grades. The Port of San Sebastian was said to have a depth of from 60 to 160 ft., while Santos, which is now the only railway terminal on the coast of São Paulo, is not accessible to large steamers. The cost of the new harbor was estimated at \$3,756,000.

**JAPAN.** The Yokohama Pier, which had been undergoing reconstruction for six years, was completed in 1917, being enlarged to 1200 ft. long and 138 ft. wide. The depth, alongside, which was formerly only 26 ft. at low water of spring tides, was increased to 35 ft. and thus provides for the largest steamers engaged in the Pacific passenger trade. Two large double-storied sheds were included in the improvement.

**NEW SOUTH WALES.** At Port Kembla there was nearing completion one of the finest harbors of New South Wales. This port was fifty miles south of Sydney, and was to be the principal shipping port for coal from the southern fields. The construction also involved breakwater and wharfage accommodations and had been under way for fifteen years.

**BIBLIOGRAPHY.** The American Association of Port Authorities, through its secretary, William J. Barney, of 110 West 40th Street, New York City, during the year published a *Selected Bibliography on Ports and Harbors and Their Administration, Law, Finance, Equipment and Engineering*, a valuable reference work for engineers engaged in this field, especially in view of the fact that the terminal and port situation was uppermost in many minds. The book gave references to periodicals and books under a number of headings.

**DOLOMITE.** See GEOLOGY.

**DOMINICA.** See LEEWARD ISLANDS.

**DOMINICAN REPUBLIC.** An independent West Indian state, occupying the larger and eastern part of the island of Haiti. The capital is Santo Domingo.

**AREA AND POPULATION.** The republic is divided into twelve provinces. The estimated area is 48,577 square kilometres (18,756 square miles). The number of inhabitants is not known with accuracy; some authorities hold that it does not exceed 600,000. Data published in 1917 placed the total, as calculated for December 31, 1915, at about 795,400, distributed by provinces as follows: Santo Domingo, 127,976; Santiago, 123,972; La Vega, 105,000; Pacificador, 90,569; Seybo, 68,135; Azua, 59,783; Puerto Plata, 55,864; Monte Cristi, 41,439; San Pedro de Macoris, 23,000; Barahona, 17,891; Samaná, 12,675. Most of the inhabitants are Spanish-speak-

ing and of mixed white, negro, and Indian blood. Estimates published in 1917 gave the city of Santo Domingo about 40,000 inhabitants, and Santiago de los Caballeros about 45,000, but it is not unlikely that these figures are too high. The town of San Pedro de Macoris is supposed to have about 20,000 inhabitants; Puerto Plata, 16,000; Samaná, Sánchez, La Vega, Azua, Moca, and Monte Cristi, about 5000 each. In 1914 and 1915 respectively, reported births numbered 24,319 and 29,431; deaths, 6393 and 6762; immigrants, 3930 and 6448.

**EDUCATION.** Primary instruction is free and nominally compulsory. Reported number of schools in 1915, 518, with 16,124 pupils. By presidential decree of November 29, 1914, the Professional Institute at Santiago de los Caballeros was formed into a university. This institution is reported to have four chairs in law, four in medicine, three in mathematics, three in pharmacy, and three in dentistry. The state religion is Roman Catholicism, but liberty of conscience and worship prevails.

**PRODUCTION.** The Dominican Republic has one of the richest and most productive soils in the world. The most important crops commercially are sugar cane and cacao. Cacao is grown in the eastern part of the country, and tobacco is a profitable product of the western part. Other crops are coffee, cotton, and bananas and other fruits. Cattle raising is a well-established industry, and there is a considerable production of honey and wax. The forest wealth of the country is notable, including many kinds of trim, construction, and cabinet woods. Their exploitation is hindered by the lack of good roads. Mining is of little importance, but recently a good copper property has been developed near San Cristobal, not far from Santo Domingo. There is little manufacturing, but cigars and cigarettes are made in increasing quantities for domestic consumption.

**COMMERCE.** In 1916, imports and exports were valued at \$11,664,430 and \$21,527,873 respectively, as compared with \$9,118,514 and \$15,209,061 in 1915. Import and export values have been as follows, in thousands of dollars:

	1906	1911	1913	1914	1915	1916
Imp. ...	4,065	6,950	9,272	6,729	9,119	11,664
Exp. ....	6,536	10,996	10,470	10,589	15,209	21,528

Leading imports in 1915 and 1916 respectively, in thousands of dollars: cotton manufactures, 1913 and 1722; iron and steel manufactures, 1201 and 1562; rice, 909 and 1080; breadstuffs, 693 and 738 (including wheat flour, 585 and 622); oils, 514 and 545; meat and dairy products, 541 and 539; manufactures of vegetable fibres (other than cotton), 360 and 509; vehicles and boats, 146 and 409; leather and its manufactures, 297 and 386.

Below are shown values of principal exports, in thousands of dollars:

	1913	1914	1915	1916
Raw sugar.....	3,651	4,943	7,671	12,028
Cacao .....	4,120	3,896	4,864	5,959
Leaf tobacco.....	1,122	394	973	1,433
Drugs, dyes, etc....	22	53	4	378
Coffee .....	257	346	458	317
Sugar cane.....	...	63	196	266
Cattle hides.....	152	164	185	213
Goatskins .....	89	90	85	122
Molasses .....	...	94	100	121
Wax .....	118	130	113	111

The increase in export values in 1915 and 1916 was due more to advance in prices than to increase in quantities. The sugar export in 1914 amounted to 101,429 metric tons, in 1915, 102,801 metric tons, in 1916, 122,643 metric tons; cacao, 20,745 tons, 20,223 tons, and 21,053 tons. The export of leaf tobacco in 1916 amounted to 7825 tons; coffee, 1731 tons; molasses, 18,752 tons.

Imports by countries, in thousands of dollars:

	1913	1914	1915	1916
United States.....	5,769	4,452	7,361	10,163
United Kingdom...	730	567	631	481
Porto Rico.....	63	134	376	378
France .....	274	161	93	152
Spain .....	211	98	145	161
Germany .....	1,678	928	95	...
Total, incl. others	9,272	6,729	9,119	11,664

Exports by countries, in thousands of dollars:

	1913	1914	1915	1916
United States.....	5,601	8,573	12,044	17,412
Porto Rico.....	29	91	249	425
France .....	888	288	189	288
United Kingdom...	242	187	84	105
Germany .....	2,068	819	6	...
Total, incl. others	10,470	10,589	15,209	21,528

**COMMUNICATIONS.** The reported length of railway in operation is 282 kilometres (175 miles); in addition, private lines for sugar plantations, 362 kilometres (225 miles). Telegraphs, 16 offices, with 352 miles of line. Telephone, 1175 miles of wire. In 1917 there were five radiotelegraph stations. Post offices, about 100.

**FINANCE.** The unit of value is the American dollar. Estimated revenue and expenditure for the fiscal year 1916, \$4,468,000 and \$4,406,567 respectively. Revenue is derived chiefly from import duties. There has been an American receivership of customs since 1905 and American control of other national revenue and of national expenditure since 1916. Funded debt in 1916, \$14,743,000; unfunded debt, \$7,000,000.

**GOVERNMENT.** The legislative power is exercised by a congress of two houses, the Senate and the Chamber of Deputies. Senators (12 in number, one from each province) are elected by indirect vote for six years; deputies (24, two from each province), by indirect vote for four years. Suffrage is held by male citizens over 18 years of age. The executive authority is vested in a president, who, according to the constitution, is elected by indirect vote for six years. He is assisted by a cabinet of seven members. In 1913, José Bordas Valdés became provisional president (April 14). After the insurrection of 1914, Bordas Valdés resigned (August 27), and Ramón Báez was elected provisional president by the Congress. At elections held later in 1914, Juan Isidoro Jiménez was chosen president, and on December 5 was inaugurated for the six-year term. Jiménez, after constant trouble with Congress, was impeached at the beginning of May, 1916, and withdrew from office on May 7. On July 26 following, Francisco Henriquez y Carvajal was proclaimed provisional president.

See UNITED STATES, *Foreign Relations*.

**DOS PASSOS, JOHN RANDOLPH.** An American lawyer, died in New York January 27, 1917. Of Portuguese-American descent, he was born in

Philadelphia in 1844 and was educated in that city, where he was later admitted to the bar. When Philadelphia was threatened in the Civil War, he enlisted in the State militia. Mr. Dos Passos early removed to New York, where he devoted himself to banking, corporate, and financial law, in which branches he became a recognized authority. He was much in demand among financiers, and aided in the formation of large business combinations, such as the Sugar Trust and the American Thread Company. Besides many pamphlets on legal and economic subjects, he published a *Treatise on the Law of Stock Brokers and Stock Exchanges* (2 vols.); *The Interstate Commerce Act*; *Commercial Trusts*; and *The American Lawyer*.

**DOUBINE.** See VETERINARY MEDICINE.

**DRAFT.** See CANADA, *History*; MILITARY PROGRESS; UNITED STATES AND THE WAR.

**DRAINAGE.** There was no great activity in the drainage of agricultural lands in 1917. The war occupied the attention of most of the world, so that public works generally were neglected. However, the advantages of drainage as an immediate means of extending the area available for crop production has caused some activity in that line and much discussion of possibilities.

**UNITED STATES.** In the United States particularly much attention was given to drainage as an emergency measure for increasing agricultural production. In many sections the wet lands had been cultivated or were in well-settled regions and their use involved no questions of colonization or settlement, and in many instances not even the providing of buildings or equipment, but merely the removal of surplus water or protection from overflow. In this respect drainage had an advantage over other methods of extending the agricultural area. This was particularly true in irrigated regions where large areas once productive have become water-logged or alkaline.

During 1917 there was considerable activity in the reclamation of such irrigated lands by drainage. The United States Reclamation Service, which is engaged primarily in the construction of irrigation works and their operation, reported that its greatest construction activity of the year was in drainage rather than irrigation. The report estimated the area of land in government projects that were in need of drainage at 142,508 acres, with much larger areas that should be protected by drains. The acreage given was about 12 per cent of area irrigated by the service in 1917. The service estimated that more than 200,000 acres in its projects were protected by drains already installed and that nearly 300,000 acres would be protected when projected drains were completed. It is probable that the government projects may be considered typical of other projects so far as drainage conditions are concerned, and on that assumption nearly 2,000,000 acres of irrigated lands are in need of drainage if it has not been provided.

A new type of drain developed in the irrigated arid region was the relief well. In many places the water which was injuring agricultural land was coming to them in some pervious underground strata, and was under some hydrostatic pressure. Wells bored into these strata and connected with drains allowed the water to rise to the drains and be carried away without being forced into the soil. This relieved the

pressure in the water-bearing strata and prevented injury to the lands. This plan had been found very effective in some sections where all attempts to drain the lands by the usual methods had failed.

In the humid sections of the United States there had been some drainage work, but very little compared to that going on a few years previously. Where drainage enterprises had been carried out for lands which had been cultivated or were in the midst of cultivated lands, the drained lands had been utilized very promptly, but where large areas of swamp lands requiring clearing and settlement had been drained, the putting of these lands into cultivation had been a slow process, and large areas were awaiting use.

Flood protection work received much attention during the year. Congress passed the "Humphreys" flood control bill authorizing the expenditure of \$45,000,000 for flood control on the Mississippi River and \$5,600,000 on the Sacramento River. This law required that local communities supply one-half as much money as was expended by the Federal government on the Mississippi River. The appropriation for this work was carried in the general river and harbor bill which failed of passage, so that this work could not be begun. The flood protection work attracting most attention during 1917 was that of the Miami Conservatory District in Ohio. Plans for the work of protection of lands and cities in the Miami Valley were completed and bids for the work were called for November 16, 1917. Most of the bids were rejected, however, although some small parts of the work were contracted for. The district sold most of its bonds at a good price and it is probable that the work will proceed. Another large enterprise is the protection of 66,000 acres in Sutter Basin, Cal., from overflow and its drainage by pumping. The reclamation of lands by flood protection and by drainage for the purpose of increasing food production and also to provide farms for returning soldiers was being urged upon Congress and it seemed likely that some provision for investigating the possibilities in that line would be made and perhaps some plans for public aid in drainage.

New drainage district laws were enacted in Minnesota and West Virginia, and the constitution of Michigan was so amended as to make it possible to sell district bonds. North Dakota created a boundary drainage commission to co-operate with adjoining States in investigating and reporting upon the best methods of drainage and flood control along boundary streams. New Mexico provided for the organization of drainage districts composed of lands in United States Reclamation projects; and other States made minor changes in their drainage district laws. The legislation of Congress on this subject has been mentioned.

**OTHER COUNTRIES.** The pressure for increased food production in England brought about the issuing of an order requiring land owners to take steps to provide proper drainage for lands which had been injured by inadequate drainage. In connection with government irrigation works in Egypt, carried on by the British in that country, drainage works to reclaim large areas in the Nile delta were planned, but the carrying out of these plans was postponed by the war. In the meantime relatively small areas

were being dyked and relieved of surplus water by pumping. The cost of this ran as high as \$80 per acre in some instances, but it was considered a paying investment. Officials of the Public Works Department were recommending that the government itself reclaim this land as an investment and dispose of it at the advanced price due to its drainage, rather than sell the land at a nominal price to be reclaimed by private enterprise.

In practically every other country reclamation of lands by drainage was stopped by the war. It seemed likely, however, that as the pressure for food became greater in countries where land was scarce, drainage would be resorted to as the best means of extending the agricultural production.

**DRAMA, AMERICAN AND ENGLISH.** In England and America, the theatre year was disappointing, not only from the point of view of commerce but also from the point of view of art. The theatre-going habit was affected by the hardship resulting from the war; and a shrinkage in the usual demand for dramatic entertainment was accompanied by a corresponding shrinkage in the quality of the supply. In England the theatres continued to do a fair-to-middling business; but most of the attractions offered were trivialities intended merely to divert the public from the contemplation of matters involving life and death. In America, the record of the year, as registered at the box-office, was divided sharply into two parts. Until—and for a long time after—the acknowledgment of a state of war between the Imperial government of Germany and the people of the United States, the theatre continued to be patronized beyond custom and beyond desert. Then, suddenly, in the autumn, there came an unexpected slump in patronage. This slump occurred coincidentally with the imposition of the new war-tax of ten per cent on theatre tickets, the record-breaking fall in the prices of stocks and bonds, and—to sum the situation up—the general sense of financial insecurity which was suggested to the public by the burdens and the problems of the war. In November and December, New York was reduced—to state the matter in the parlance of the theatre—to the status of a two-weeks stand. No new attraction, however interesting in itself, could expect to draw sufficient patronage to warrant its continuance beyond a bare initial fortnight. This unaccustomed situation was hard upon the dramatist, the actor, and the manager. The theatre, indeed, had fallen on evil days. In this moment of commercial panic, our drama, instead of standing firmly on its feet, resorted weakly to a series of side-steppings and evasions. It was soon assumed that, in bad times, the public would prefer bad plays to good; and this fallacy resulted in a general depreciation of the season from the point of view of art.

Most of the leading British dramatists were silenced by the deep preoccupations of the year; and nearly all the current London entertainments were composed by men of secondary calibre. Sir James Barrie was the only British playwright of the highest rank who added to his fame in 1917. Two one-act plays of Barrie's—both inspired by the war—were shown in London early in the season and were repeated subsequently in New York. Both were masterpieces, according to their kind: *The New World*,

a delicate essay in a reticent and tingling mood of comedy; and *The Old Lady Shows Her Medals*, an appealing essay in a touching mood of pathos. Later in the year, this dramatist disclosed in London an interesting full-length play—*Dear Brutus*—which discussed the thesis that the destiny of men is written in themselves instead of in their stars. A timely satire by Henry Arthur Jones, entitled *The Pacifists*, immediately failed in London, despite the fact that it discussed intelligently a topic of more than momentary interest. Pinero, Shaw, Galsworthy, and other leading British dramatists, remained silent throughout the course of this unusually unproductive year.

The American public, however, was first offered in 1917 an opportunity for seeing several works of British authorship that had been written in the past. John Galsworthy was represented by a popular but inartistic production of *The Fugitive*, a sympathetic rendering (in San Francisco) of *A Bit o' Love*, and an almost adequate exhibition of *The Little Man*. George Bernard Shaw was represented by a belated production of *Misalliance*,—a poor play which was acted admirably by a company rehearsed by William Faversham. The first and only play of Gilbert K. Chesterton—entitled *Magic*—was performed for a few weeks in New York and was accorded a *succès d'estime*. But one of the triumphs of the season in America was a dramatization of George du Maurier's novel, *Peter Ibbetson*, which was made by John Raphael, who died a few weeks before his play was carried to success by the acting of John and Lionel Barrymore and Constance Collier.

The *entente cordiale* between America and France was emphasized more than once in the offerings of the theatre-season. In fact, 1917 may come to be regarded by future historians of the American theatre as "the season of Molière." Early in the year, an impression unusual in emphasis was registered by Charles D. Coburn with his production of an English version of *Le Malade Imaginaire*. This performance was soon followed by an offering in English, of *Sganarelle, ou Le Cocu Imaginaire*, which was exhibited by The Washington Square Players. In November, *Les Fourberies de Scapin* was played, in French, by the company of Jacques Copeau, as the leading feature of the inaugural performance that marked the transference of Le Théâtre du Vieux-Colombier from Paris to New York. The beneficent erection in New York of a new and fine French theatre under the far-seeing patronage of the government of France is an event that calls for special emphasis amid the records of the year. During the course of the later months of the theatre-season, three other interesting plays of French authorship were offered to the public, in translation, through the ordinary channels of theatric commerce. These were *The Torch*, by Henry Bataille, *L'Élévation*, by Henry Bernstein, and *The King*, by Armand de Caillavert, Robert de Flers, and Emmanuel Arène.

The American theatre has always been traditionally hospitable to plays of foreign authorship. In 1917, it offered a more or less sympathetic hearing to a Russian play called *Nju*, by Ossip Dimov, an Irish play called *Grasshopper*, by Padraic Colum, a German play called *Frühlings-Erweichung*, by Frank Wedekind, a Swedish play called *The Deluge*, by Henning Berger, and

UNVEILING THE STATUE OF MOLIÈRE AT THE OPENING OF THE  
THÉÂTRE DU VIEUX COLOMBIER

a Hungarian play called *Over the 'Phone*, by Imre Foeldes.

It is an interesting fact that nearly all the plays inspired by the current war went down to speedy failure. Even Bernstein's *L'Élévation*—which had been highly heralded in Paris—did not attract a paying patronage in New York. The reason for this fact is that the theatre cannot compete successfully against the first pages of the daily newspapers. When a man has paid two dollars for the privilege of entering a theatre, he does not like to listen to the same sort of story that he has just read, on his way to the playhouse, in a penny paper. *Out There*, by J. Hartley Manners, was a war-play of admitted merit; and it was fairly well received. More conventional and sentimental—and also less successful—was *Lilac Time*, by Jane Cowl and Jane Murfin. [Later in the season, these feminine collaborators brought forward a traditional but rather interesting melodrama entitled *Day-break*.] The two best and biggest war-plays of the year were shown only to restricted audiences. These were *The Iron Cross*, by Elmer L. Reizenstein, and *As It Was in the Beginning*, by Arturo Giovannitti. The former was produced by The Morningside Players and the latter by The Stage Society of New York. Both plays were meritorious as human documents; but the commercial managers judged rightly that there was no money in them.

The weightiest American play of the year was *Ception Shoals*, by H. Austin Adams. This piece—although excessively didactic—was truthfully imagined, and soundly and solidly constructed; and it was wonderfully acted by Madame Nazimova. Valuable also—as a document and as a well-made play—was *Hamilton*, a transcript from American history by George Arliss and Mary Hamlin.

The year was notable for certain undeniable advances toward the ultimate achievement of high comedy in America. A new writer, named Clare Kummer, added to the laurels gained from *Good Gracious, Annabelle!* by the production, in quick succession, of *A Successful Calamity* and *The Rescuing Angel*. The second of these three plays was the best; the third was disappointing; but the fact was registered emphatically that Clare Kummer is an author to be reckoned with. All three plays were charmingly produced by Arthur Hopkins. William J. Hurlbut increased his reputation, among "those who know," by delivering two tenuous but brilliant comedies, both of which suffered the fate of commercial failure at a time when commercial success was almost unattainable. These two delightful comedies were called *Saturday to Monday* and *Romance and Arabella*. Edward Childs Carpenter—an author of unique and undeniable ability in the field of sentimental comedy—advanced his reputation with two plays,—*The Pipes of Pan*, an idyll of the poetry of middle age, and *The Three Bears*, an idyll of the poetry of youth. In a somewhat similar vein of romantic sentiment, a sure success was registered by Robert Housum with *The Gipsy Trail*,—a piece in which the note of youthfulness was sung forth with full-throated ease. Less emotional, more intellectual, and much more brilliantly satirical were *Why Marry?*, by Jesse Lynch Williams, and *The Family Evil*, by Lawrence Langner,—two clever comedies of American authorship which showed the influence of

Shaw. *Why Marry?* is indeed a composition that possesses more than passing merit. It constitutes a contribution to American literature as well as to the American drama. From many points of view, this satirical comedy may be regarded as the best American play of the year. Admirable also, for its spirit of burlesque and its tone of youthful and enchanting impudence, was *Madame Sand*, a "biographic comedy" by Philip Moeller, that was played delightfully by Mrs. Fiske.

In America, there is a free and easy kind of comedy or farce—written either in a local dialect or in a momentary slang—that attains the dignity of art by virtue of its obtrusive truth to human nature. Supremacy among the compositions of this class was attained in 1917 by *Business Before Pleasure*, by Montague Glass and Jules Eckert Goodman,—the third and best of a series of plays depicting the personal adventures of two real and vivid characters,—Abe Potash and Mawruss Perlmutter. A clever composition (in accordance with the formula established long before by George Cohan) was *A Tailor-Made Man*, by Harry James Smith. Amusing, also, was a satire of the solemnly-regarded propaganda of eugenics, entitled *The Very Idea*, by William le Baron.

The vogue of the so-called "trick play" suffered a decline in 1917. Not more than three new compositions were presented which claimed attention by virtue of a new and unexpected juggling of the technique of the drama. These three inventive and unprecedented fabrications were *De Luxe Annie*, by Edward Clark, *Eyes of Youth*, by Max Marcini and Charles Guernon, and *Yes or No*, by Arthur Goodrich.

Among the American melodramas of the year, *The Knife*, by Eugene Walter, was the most exciting, and *Tiger Rose*, by Willard Mack, was the most effectively produced. Interesting, also, were *The Masquerader*, by John Hunter Booth, and *The Scrap of Paper*, by Arthur Somers Roche and Owen Davis. *The Claim*, by Frank Dare and Charles Kenyon, and *Broken Threads*, by Ernest Wilkes, though less successful, were worthy of a note of record.

In the secondary mood of sentimentalism, the most successful American production of the year was *Polly With a Past*,—a jejune but entertaining comedy by Guy Bolton and George Middleton. Other essays in this genre that deserve to be recorded were *The Willow Tree*, by Harrison Rhodes and J. Harry Benrimo; *Barbara*, by Florence Lincoln; and *Seremonda*, an anachronistic melodrama in blank verse by William Lindsey.

Among the minor and less memorable plays of the vintage of 1917 were *The Brat*, by Maud Fulton; *Pale Firat*, by Lee Wilson Dodd; *Mary's Ankle*, by May Tully; *The Country Cousin*, by Booth Tarkington and Julian Street; *Lombardi, Ltd.*, by Frederic and Fanny Hatton; *Here Comes the Bride*, by Max Marcini; *On With the Dance*, by Michael Morton; *The Land of the Free*, by Fannie Hurst and Harriet Ford; *Losing Eloise*, by Fred Jackson; and *Blind Youth*, by Willard Mack and Lou Tellegen.

Two sumptuous and impressive spectacles were produced, during the course of the year, at the Manhattan Opera House, by the enterprising firm of Elliott, Comstock and Gest. The first of these was *The Wanderer*, a Biblical tale adapted from the German by Maurice V. Samuels, and

the second was *Chu Chin Chou*, an oriental narrative by Oscar Asche.

Among the notable "revivals" of the year, the following should be recorded:—Ibsen's *Ghosts* [produced by the Washington Square Players]; Pinero's *The Gay Lord Ques* (produced by John D. Williams); Barrie's *The Professor's Love Story* (produced by George Arliss); *The Lady of the Camellias*, by Alexandre Dumas fils (produced by Ethel Barrymore); R. C. Carton's *Lord and Lady Algy* (produced by William Faverham); William Vaughan Moody's *The Great Divide* and A. E. Thomas's *Her Husband's Wife* (both produced by Henry Miller); and George M. Cohan's *Get-Rich-Quick Wallingford* (produced by Hale Hamilton and Edward Ellis).

The "little theatre" movement was continued successfully throughout the year. In New York, The Washington Square Players, The Provincetown Players, and The Neighborhood Players added to their laurels. A new and interesting note was struck by a company of Negro Players—assembled by Mrs. Emilie Hapgood—in a repertory of Negro Plays, written with extraordinary insight by Ridgely Torrence. In the autumn, The Greenwich Village Theatre was opened, in New York, under the direction of Frank Conroy; and the initial bill gave promise of a fine fulfillment in the future.

In the early spring, Sir Herbert Tree appeared before the public of New York in a series of farewell performances, in the part of Colonel Newcome. At the close of this engagement, he returned to England; and, shortly afterward, he died. The sudden taking-off of this celebrated actor-manager was one of the outstanding incidents of the year. A few days later was announced the death of William Winter, the dean of dramatic critics in America,—a good and faithful servant of the theatre who "saw life steadily and saw it whole" and wrote with an inspired ear for prose.

Sarah Bernhardt—at the age of two and seventy—undertook another tour of America in 1917; and the season was made memorable also by the reappearance—on the new stage of Le Théâtre du Vieux Colombier—of the finest of all living artists in the world,—Yvette Guilbert.

**DRONE, EATON SYLVESTER.** An American legal writer and newspaper editor, died at Zanesville, Ohio, February 2, 1917. He was born at Zanesville in 1842 and graduated from Harvard in 1866. Three years later, after taking an M.A., he went to New York and was admitted to the bar. Through articles and his book *Law of Property in Intellectual Productions* (1879), he became known as an authority on copyright. In legal writing he was associated with George Ticknor Curtis. After contributing for a number of years to the New York *Herald*, he became its editor in 1893 and held this post till ill-health forced his retirement in 1905.

**DRUMONT, EDOUARD (ADOLPHE).** A French writer and anti-Semite leader, died in Paris February 3, 1917. Born in Paris in 1844, he studied at the lycées Bonaparte and Charlemagne, and early entered journalistic work on the *Univers*, *Nain jaune*, and *Bien public*, remaining on the last of these for four years. He became editor of the *Liberté* and art critic of the *Petit Journal*, and wrote also for the *Gau-*

*lois*, *Monde*, *Contemporaine*, etc. Up to 1886 he was known for such historical works as *Les fêtes nationales de la France*, *Mon vieux Paris*, which was crowned by the Academy, *Papiers inédits du duc de Saint-Simon*, and the *Journal des An-thoine*; for a romance, *Le dernier des Trémolin*; and for a play, with Dollfus, *Je déjeune à midi*. In the year named he began, with his *La France juive devant l'opinion*, a campaign against the Hebrews in France which lasted all the rest of his life and made him an acknowledged leader of anti-Semitic feeling. He did not confine himself to generalities but mentioned names without reserve. The consequence was that he was involved in duels with Charles Laurent, director of the *Paris*, and with Arthur Meyer of the *Gaulois*. He was severely wounded, through his opponent's trickery he claimed in court. Drumont had to pay a fine for publishing the book, and it just escaped being suppressed. But he continued his attacks in *La fin d'un monde*, *La dernière bataille*, *Gambetta et sa cour*, and *Le secret de Fourmies*. The *Libre parole*, which he founded in 1892 and of which he became director, served as the chief organ of the anti-Semites. For defaming Burdeau, Drumont was condemned to three months in prison and to pay a fine of not less than 80,000 francs. The Dreyfus case brought from him *Les Juifs et l'affaire Dreyfus* and the Panama scandal *De l'or, de la boue, du sang: du Panama à l'anarchie*. Elected as a Socialist deputy in 1898, Drumont had a stormy career in the Chamber which gave him material for violent attacks on political methods and machinery. His later books included *Les tréteaux du succès: figures de bronze ou statues de neige*, and *Vieux portraits et vieux cadres*.

**DUNKARDS or DUNKERS.** See BRETHREN, CHURCH OF THE.

**DUPUIS, NATHAN FELLOWS.** A Canadian educator and author who died on July 23, 1917. He was born at Portland, Ontario, in 1836. He graduated from Queen's University (Kingston) in 1866 and a year later was appointed professor of chemistry in that institution. In 1880 he was transferred to the department of mathematics. He was for a number of years public inspector of schools for Kingston. His publications include: *Elements of Geometrical Optics*; *Junior Algebra*; *Elements of Synthetic Solid Geometry*; *Elements of Trigonometry for Practical Science Students*; *Spherical Trigonometry and Astronomy*; *Descriptive and Mechanical Astronomy*.

**DUTCH EAST INDIES.** Possessions of the Netherlands, lying between Australia and the Asiatic continent. Capital, Batavia.

**AREA AND POPULATION.** The Dutch East Indies consist of two main divisions: (1) Java (16 residencies) and Madoera (1 residency); and (2) the outposts (17 provinces). Area (for the outposts approximate) of Java, Madoera, and the outpost provinces, 739,547 sq. miles; population December 31, 1912, 37,979,377. A table detailing the area and population will be found in the 1916 YEAR BOOK.

**PRODUCTION.** Area (1915) under rice, 6,940,000 acres; sugar cane, 438,872 (sugar production, 1,343,304 tons); tobacco, 427,000; indigo, 17,000; other cultures, 7,712,000. Government coffee plantations (Java) produced (1915) 3032 tons; production from private estates, Java 19,000 tons, Robusta, 29,375. Tobacco: 38,003,802

The Netherlands is the important country of destination for exports, which consist mainly of sugar, coffee, tea, indigo, cinchona, tobacco, copra, and tin. A large export of rice goes to Borneo and China. There were entered at the ports in the 1915 trade 7682 steamers, of 4,070,617 tons, and 3872 sailing vessels, of 225,900.

**FINANCE, ETC.** Estimated revenue, 1917, 346,111,805 florins; expenditure, 404,357,117. A. W. F. Idenburg was appointed governor-general, August 20, 1909. Dr. J. P. (Count) Van Limburg Stirum, appointed October 28, 1915, was governor-general in 1917.

**DUTCH GUIANA, or SURINAM.** A Netherlands colony (between 46,000 and 49,000 square miles) on the northern coast of South America. Population (January 1, 1916), 88,750 (exclusive of negroes in interior forests). Total at the end of 1913, 86,134. Emigrants are employed under contract on plantations. Sugar production, 1915, 14,747,100 kilograms (1910, 12,015,100); molasses, 112,000 liters (164,100); rum, 1,693,500 litres (797,800); cacao, 1,464,200 kilos (1,683,000); coffee, 609,700 kilos (202,320); corn, 1,867,900 kilos (1,323,000); rice, 910,682 kilos (1,993,700). Gold yield, 5,280,200 grams (1,081,476); gold export, 1,019,843 florins (1,446,073). Total imports 1915, 5,445,866 florins; exports, 6,949,315. Revenue 1917, 3,198,000 florins; expenditure, 4,818,000; subvention, 1,620,000. Governor 1917 G. Y. Staal.

**DUTCH REFORMED CHURCH.** See REFORMED CHURCH IN AMERICA.

**DUTCH WEST INDIES.** See CURAÇAO.

**DWIGHT, HENRY OTIS.** An American Congregational missionary, born in Constantinople in 1843, died on June 19, 1917. He entered the Ohio Wesleyan University, but left in 1861 to serve in the Civil War. He was business agent of the American Board of Commissioners of Foreign Missions (1867-72), edited missionary publications in the Turkish language for seven years, and from 1875 to 1892 was also Constantinople correspondent of the *New York Tribune*. Meanwhile (1880) he had been ordained for the

ministry. After resigning his commission as missionary in 1901 he was connected prominently with various missionary and Bible societies in the United States. He edited *Report of the Ecumenical Conference on Foreign Missions*, and the *Encyclopædia of Missions*, and wrote *Turkish Life in War Time*; *Treaty Rights of American Missionaries in Turkey*; *Constantinople and Its Problems*; *Blue Book of Missions*; *A Moslem Sir Galahad*; *Centennial History of the American Bible Society*. He contributed to the *New International Encyclopedia*.

#### DYESTUFF AND DYESTUFF SITUATION.

See CHEMISTRY, INDUSTRIAL.

**EAKLEITE.** See MINERALOGY.

**EARTHQUAKES.** Few damaging shocks came to notice in 1917, but important losses were involved in the Central American disturbances of June 7 and December 25-29. On the former date the city of San Salvador was nearly destroyed by earth tremors which seemed to have originated close by and to have been precursory to the volcanic outburst of Quetzaltepeque (see VOLCANOES) which inflicted further damage in the outlying district. The zone of destruction was small and much of the property loss was owing to the weak nature of the structures typical of the country. Guatemala City, capital of the Republic of Guatemala and a prosperous commercial city of nearly 100,000 persons, was laid in ruins by a series of quakes which began Christmas night and continued at intervals until December 29, when a final heavy shock that transmitted its tremors over thousands of miles destroyed all that had been left after the previous shakings. The collapse of the presidential palace, post office, cathedral, and Colon theatre, in addition to other important buildings, was reported, while the total damage ran into many millions of dollars. Much suffering was inflicted upon the inhabitants who were driven into the open and for a time were without shelter or sufficient food. The list of fatalities was small, since the preliminary tremors gave due warning of the ensuing disaster. The number was estimated at less than 100.

**SEISMOLOGY.** As a measure of the frequency of earthquakes in periods of relative seismic repose, the tabulation of the California occurrences for 1916, prepared by A. H. Palmer, is of considerable interest. Altogether 326 stations in that State were employed in recording observations, so that few if any sensible tremors may be supposed to have escaped detection. The number of separate records obtained was sixty-six, of which only two developed an intensity corresponding to class six of the Rossi-Forrel scale. Most of the disturbances are believed to have set up by fault slips. From plotting of their origins on the map it appeared that more occurred on the coast than in the interior and more in southern California than in the northern part of the State. The San Francisco district was represented by a single shock.

**EAST AFRICA PROTECTORATE.** The territory lying between the Umba and Juba rivers from the former German East Africa to Italian Somaliland and Abyssinia, and inland to Uganda; a British dependency. These territories comprehended under the name "The East Africa Protectorate" include the whole of the coast from the Umba to the Juba rivers, granted on a 50-year lease by the sultan of Zanzibar, as also the vast territories in the interior bounded in

part by international conventional lines. The southern boundary was defined by the Anglo-German conventions of 1886, 1890, and 1893; that on the east (along the Juba) and northeast, by an agreement with Italy (1891). On the west the protectorate adjoins that of Uganda. The administration is carried on under the colonial office. Estimated area, about 200,000 square miles. The population is estimated at about 4,000,000, including about 25,000 Asiatics and 3500 Europeans. A great portion of the country is pasture land or barren waste, but there are extensive districts of great natural fertility. The protectorate is divided for administrative purposes into seven provinces, which are subdivided into districts and sub-districts: (1) Seyidie, (2) Ukamba, (3) Tanaland, (4) Jubaland, (5) Kenya, (6) Naivasha, (7) Nyanza, of which the centres of administration are respectively Mombasa, Nairobi, Lamu, Kisumu, Fort Hall, Naivasha, and Kisumu. The East Africa Protectorate also includes the Witu Protectorate, a small tract of country at the mouth of the river Tana. The British Protectorate was proclaimed November 19, 1890. In March, 1891, the Imperial British East Africa Company undertook the administration of the country, from which they withdrew on July 31, 1893. Witu is now regarded for administrative purposes as part of Tanaland.

Mombasa, which is connected with Europe by telegraph, possesses perhaps the finest harbor on the east coast of Africa (population about 30,000, of whom 200 are Europeans). There is also telegraphic communication along the coast between Mombasa and Lamu, and between Mombasa and Entebbe, the capital of the Uganda Protectorate. There are also extensions to Kiambu, Nandi, Wadelai on the Nile, and Fort Hall. The Uganda Railway has its terminus at Mombasa, which is connected with the mainland by a railway bridge 1732 ft. in length. Nairobi, the capital of the protectorate, and central station of the Uganda Railway, has a population of about 14,000, of whom 700 are Europeans. There are also some 400 Europeans in the immediate neighborhood of Nairobi. In 1914, of the 639,640 acres (11,250 freehold, 628,390 lease), classed as productive, 630,005 were devoted to grazing, 9635 to crops. Cattle, sheep, and ostriches are raised. The crops include grain, coconuts, cotton, sisal, rubber, tobacco, coffee, and fruits. The worked mines yield carbonate of soda, limestone, graphite, and gold. The cost of construction of the Uganda (Mombasa-Victoria) Railway (618 miles) to March 31, 1915, was approximately £6,409,481. Five steamers are operated on Victoria Nyanza in connection with the railway. The telegraph system, exclusive of the lines in Uganda, has 2321 miles of line (the railway line has three wires). Commercial and financial figures follow:

	1908-9	1910-11	1913-14	1914-15
	£	£	£	£
Imports . . .	797,158	1,000,346	2,147,937	1,469,210

\* Tonnage entered at Mombasa and Kilindini.

The import figures are exclusive of railway material, government stores, and specie. The

United Kingdom supplied imports to the value (1914-15) of £636,857, and received exports valued at £601,317; British possessions, £386,383 and £80,845; the United States, £84,410 and £50,033.

**ECOLOGY.** See **BOTANY**.

**ECONOMIC ASSOCIATION, AMERICAN.** See **POLITICAL ECONOMY**.

**ECONOMIC GEOLOGY.** See **GEOLOGY**.

**ECTOPRITE.** See **MINERALOGY**.

**ECUADOR.** A republic on the Pacific coast of South America, between Colombia on the north and Peru on the south. Capital, Quito.

**AREA AND POPULATION.** The area cannot be stated with accuracy on account of unsettled boundaries. A tentative estimate is 299,600 square kilometres (115,676 square miles); or, including the Galápagos, 307,243 square kilometres (118,627 square miles). Ratifications of a boundary treaty were exchanged with Colombia January 26, 1917; the work of rectifying the boundary was begun by commissions of the two countries in July. The population in 1910 was estimated at 1,500,000; in 1915, at 2,000,000. It is not unlikely that the latter figure is too high. The proportion of pure white inhabitants is very small; the bulk of the population is Indian, and mestizos are supposed to number about 400,000. Guayaquil, by far the most important seaport, has an estimated population of 80,000 (some estimates are higher, one being 105,000); Quito, about 75,000; Cuenca, about 50,000; Riobamba, 20,000; Ambato, Loja, and Latacunga, about 12,000 each; Ibarra, Bahía de Caraquez, and Puertoviejo, about 10,000 each.

**EDUCATION.** Elementary instruction is free and nominally compulsory. Primary schools number about 1400, with an enrollment of nearly 100,000. There are 35 secondary schools, besides 9 government higher schools and commercial and technical schools at Guayaquil and Quito. There are three universities—the Central University at Quito, the Azuay University at Cuenca, and the Guayas University at Guayaquil. At Loja is a law school. The state religion is Roman Catholicism.

**PRODUCTION.** The most important crop commercially is cacao, for which the country has long been famous. Ecuador supplies a large part of the world's supply of cacao, though its proportion is smaller than formerly; the average annual output has not declined, but the production in other tropical countries, as eastern Brazil, the Dominican Republic, and São Thomé, has increased. The Ecuadorian cacao is grown in the coastal regions. Another valuable product is ivory nuts, the fruit of the tagua palm, which grows wild and uncultivated. Other products of some importance are coffee, rubber, sugar cane, grains, vegetables, and tobacco. The raising of cattle, goats, and sheep is a profitable industry, grazing lands being abundant both on the coast and in the interior. Ecuador has large mineral resources, including petroleum, but mining has been only slightly developed. Some gold is produced and exported. The only manufacture of more than local importance is Panama hats, of which large numbers are produced. The finest Panamas come from the provinces of Manabí and Guayas.

**COMMERCE.** The reported value of imports in 1916 was \$9,330,173, and of exports \$17,569,691, as compared with \$8,408,143 and \$12,895,069 in 1915. Import and export values, in thousands

of sucres and in the equivalent thousands of dollars, have been as follows (with the sucre at 48.6 cents):

	1912	1913	1914	1915	1916
<b>Imports:</b>					
1000 sucres....	21,806	18,182	17,290	17,801	...
1000 dollars...	10,855	8,837	8,403	8,408	9,380
<b>Exports:</b>					
1000 sucres....	28,168	32,488	26,876	26,538	...
1000 dollars...	13,690	15,789	13,062	12,895	17,570

Leading imports in 1914 and 1915 respectively, in thousands of sucres: textile goods other than silk, 4507 and 3687; foodstuffs, 2750 and 2583; hardware, 1574 and 1194; ready-made clothing, 743 and 619; drugs and medicines, 605 and 584; machinery, 762 and 571; wines and liquors, 491 and 420; specie, 621 and 2909.

The principal export values are shown below, in thousands of sucres:

	1912	1913	1914	1915
Cacao .....	15,716	20,531	20,769	19,988
Panama hats.....	2,817	2,341	2,000	1,723
Gold bars, etc.....	619	679	752	1,088
Ivory nuts.....	1,923	4,399	944	1,081
Coffee .....	1,609	1,717	1,212	952
Cattle hides.....	606	698	480	594
Rubber .....	1,435	371	185	404

The cacao export in 1913 amounted to 41,894 metric tons, and in 1915 to 37,019 metric tons. In these years respectively, the United States took 10,723 and 15,568 tons; United Kingdom, 2605 and 9353; France, 19,999 and 3694; Netherlands, 929 and 3439; Spain, 2176 and 1982; Denmark, 8 and 1054; Italy, 150 and 1008; Sweden, 0 and 486; Germany, 4305 and 188. Some of these figures show the remarkable effects of the great war on Ecuador's chief export. It may be assumed that a large part of the increased export to the Netherlands, Denmark, and Sweden found its way to Germany. The export of ivory nuts in 1913 amounted to 31,684 metric tons, and in 1915 to 9115 metric tons. In these years respectively, Italy took 2868 and 4490 tons; the United States, 8329 and 3155. The export of cattle hides in 1913 amounted to 1020 metric tons, and in 1915 to 894 metric tons; coffee, 3686 and 952; rubber, 193 and 256. Panama hats to the value of 636,000 sucres were sent to the United States in 1913, and 1,048,000 sucres in 1915.

Imports and exports by principal countries, in thousands of dollars:

	Imports		Exports	
	1914	1915	1914	1915
United Kingdom....	2,414	3,847	1,231	2,064
United States.....	2,771	3,204	3,588	5,678
Italy .....	379	399	283	598
Spain .....	365	380	628	582
Peru .....	299	270	85	129
France .....	327	246	4,438	1,176
Netherlands .....	60	172	1,013	981
Germany .....	1,204	51	860	42
Total, incl. others.	8,403	8,408	13,062	12,895

**COMMUNICATIONS.** Ecuador has few good roads, and the lack of transportation facilities greatly hinders the country's development. There are in operation about 400 miles (about 650 kilometres) of railway; of this, 297 miles are comprised in the line from Durán (across the Guayas River from Guayaquil) to Quito. In

1917, there was a proposition under discussion to build a railroad from Puerto Bolívar to Cuenca, while by a decision of the Congress of Ecuador, the municipality of Quito was authorized to grant exclusive concession for thirty years for the construction of an electric railway from the capital to any town or towns of the canton. Guayaquil is one of the chief ports on the west coast of South America. Of Ecuador's total import trade in 1915, the value of 16,012,863 sucres was credited to Guayaquil; of the export trade, 23,175,869 sucres.

The reported length of telegraph line is nearly 4400 miles, with 204 offices. Wireless telegraphy has been installed. Post offices, about 200.

**FINANCE.** The standard of value is gold. The monetary unit is the sucre; its par value is 48.665 cents, or one-tenth of a pound sterling. The sucre is thus equivalent to the Peruvian sol. The estimated revenue for 1917 was 16,122,450 sucres; estimated expenditure, 16,106,870 sucres. Principal items of estimated revenue, aside from taxes, in 1917: import duties, 6,128,370 sucres; export duties, 3,420,600; stamps, 514,840. The chief disbursements are for administration, defense, public instruction, and service of the debt; interest on the debt, however, after the breaking out of the great war, fell into arrears. Funded debt, as stated for 1916, 39,927,000 sucres; unfunded debt, 8,599,000 sucres; total in American currency, \$23,615,000.

**GOVERNMENT.** Ecuador is a centralized republic, the sixteen provinces into which the country is divided being administered by governors appointed by the national executive. The national legislative power is exercised by a congress of two houses, the Senate and the Chamber of Deputies. Senators (32 in number, 2 from each province) are elected for four years and deputies (48) for two years, all by direct vote. The franchise is held by male citizens who are over 21 years of age and able to read and write. The executive authority is vested in a president, who is elected by direct vote for four years and is ineligible for reelection until after a lapse of two terms. He is assisted by a cabinet of five members. On March 31, 1912, after an insurrection, Gen. Leonidas Plaza Gutiérrez, commander of the government forces, was elected president, and on August 31 following was inaugurated for the four-year term. General Plaza had been president in 1901-05. In 1916, Alfredo Baquerizo Moreno was elected president and assumed office on September 1 of that year.

**EDSALL, SAMUEL COOK.** An American Protestant Episcopal bishop, died at Rochester, Minn., February 17, 1917. He was born at Dixon, Ill., in 1860 and was educated at Racine College. At first he studied law and was admitted to the bar, but afterward attended the Western Theological Seminary, being ordained deacon in 1888 and priest in 1889. He then went to Chicago, where he founded St. Peter's Mission and where he remained for a decade. From 1899 to 1901 he was missionary bishop of North Dakota, and after a few months as coadjutor bishop of Minnesota he became bishop in 1901. He published in 1898 *Prayer Book Preparation for Confirmation*. He received honorary degrees from Racine and Illinois Colleges and the Western Theological Seminary.

**EDUCATION.** See section so entitled in articles on foreign countries and States of the

United States; also EDUCATION IN THE UNITED STATES, and UNIVERSITIES AND COLLEGES.

**EDUCATION, AGRICULTURAL.** See AGRICULTURAL EDUCATION.

#### EDUCATION IN THE UNITED STATES.

**STATISTICS.** *Attendance in Elementary and Secondary Schools.* The latest available data for attendance are for the school year ending June 30, 1914. The report of the United States Commissioner of Education shows that there were enrolled in public and private elementary schools 19,561,292 pupils of whom 17,934,982 were in schools under public control. There were 1,218,804 students in public high schools and 154,857 students in private schools of secondary grade. The preparatory departments of higher institutions enrolled 85,738 secondary students. In addition to the numbers just mentioned there were 610,966 students in evening classes, 54,798 in reform schools, 178,063 in business schools, 13,859 in schools for the deaf, 4971 in schools for the blind, 14,940 in schools for the feeble-minded, 32,718 in government Indian schools, 6766 in schools in Alaska, 20,000 in orphan and other benevolent institutions (estimated), 74,725 in private kindergartens, and about 60,000 in miscellaneous schools including those in art and music. The public and private schools of elementary and secondary grade were attended by 22,083,497 individuals of whom nearly 20,000,000 were in public schools.

The total number of days' schooling received by the average child was surprisingly small, being 1127 days for the whole country and varying from 790 days in the Southern Central States to 1360 days in the Western Division.

In the elementary schools about 23 per cent of the children were in the first grade while only 7.63 and 6.36 per cent remained in the seventh and eighth grades respectively. In the high school 40 per cent of the students were in the first year and only 14.27 per cent of the students remained in the fourth year.

*Enrollment as Affected by the War.* Preliminary statistics obtained by the United States Bureau of Education indicate the effect that the war had on public school enrollment. Reports from 1411 cities and 696 counties showed that there had been an increase in enrollment, but not as great as the normal increase would have been. The enrollment in the elementary schools showed about the normal rate of increase. In the high schools, however, the increase was only about one fourth of what it would have been under normal conditions. Every class except that of the fourth year showed a decrease in the number of boys enrolled. The increase in the number of high school girls was about normal. The increase in enrollment in cities in the elementary schools was above normal, but about ten per cent less than normal in the high schools. In rural schools the enrollment was not equal to normal in either elementary or high schools. The rural high schools, however, had not suffered as large a proportionate loss as had the city high schools.

*Cost of Elementary and Secondary Schools.* The total cost of the public and private elementary and secondary schools was \$684,218,480. The per capita cost was least in the public elementary schools and greatest in the schools for the feeble-minded, being \$27.11 in the former and \$555.42 in the latter institutions. It appears, therefore that the public was required

to pay as much for the care of one feeble-minded child as it paid for the care of twenty normal children. Very few States had made more than a beginning in the caring for the feeble-minded yet the total cost was even then equal to that paid for reform schools or for commercial and business schools.

*Elementary and Secondary Schools for Negroes.* In the sixteen Southern States, the District of Columbia, and Missouri there were according to the census of 1910 a total of 2,023,108 negro children between the ages of 6 to 14 years. Only 58.1 per cent or 1,175,457 of these children were in school. Private elementary schools cared for 70,564 children, the others being in public elementary schools. There were 24,189 colored secondary students in the Southern States. Of these 11,527 were in private and 8707 in public high schools and 3800 in State or Federal schools of secondary grade.

*Cost of Negro Education.* The cost of negro education could not be exactly determined because the States did not make separate appropriations for colored schools. Some conception of the relative costs of education for the children of whites and negroes may be gained from the fact that in the Southern States the salaries of teachers were \$10.32 for each white child and \$2.89 for each colored child who attended public schools.

*Teachers in the Public and Private Elementary and Secondary Schools.* The number of teachers in the public elementary schools in 1914 was 522,149 of whom 432,534 were women and 89,615 were men. In private elementary schools there were 57,900 teachers of whom 32,862 were women and 25,047 were men. The public high schools employed 47,411 teachers of whom 39,354 were women and 8000 were men. The private high schools had 13,890 teachers of whom 8070 were women and 5820 were men.

**CHANGES IN CURRICULUM.** During recent years severe criticisms have been directed against the curriculum and methods used in elementary and secondary schools. The charge is made that the ordinary high school arranges its work for the student who will enter college although only one in ten will do so. The elementary school in turn prepares for the high school although only half of the children go through the high school. This work which may be well adapted for those who will attend college is not suitable for those who leave school as soon as the laws of attendance will permit. Cities are meeting this situation by the introduction of industrial and commercial schools or such departments in the regular high schools. These schools or departments aim to fit the student for some particular trade or occupation.

Changes in the elementary school are still in the experimental stage. In general such experiments as are under way are conducted in private schools. There is no accurate list of these schools, but it is certain that the number is large. The most noteworthy of these undertakings is the following.

**THE LINCOLN SCHOOL OF TEACHERS COLLEGE.** This school is supported by the General Education Board and is under the control of Teachers College of Columbia University. The school is at 646 Park Avenue, New York. It was opened for the first three grades and grades VII, VIII, and IX in September, 1917. The following quotations taken from the announce-

ments of the school serve to indicate its plans and purposes: "The Lincoln School is to be established for the purpose of contributing by experiment to the development of a curriculum adapted to modern conditions. . . . It will endeavor to organize a curriculum which recognizes the varied interests and activities of actual life. The curriculum will include the following subjects: modern languages, civics, history, literature and compositions, the fine arts and music, sciences, mathematics, physical training, household, and industrial arts. Experiments will be made with such languages as English, French, and German to determine what methods give the most substantial and effective results in the use of the languages. History, civics, and the other social studies will be taught so as to contribute to a proper understanding and use of the institutions and organizations of community, city, and State, to the end of developing intelligent attitude and responsibility toward the affairs of civic and social life. Science and the industrial and domestic arts will be prominent throughout the school, with abundant laboratory, shop, home, and field experience as the basis of work. In the subject of mathematics an attempt will be made to develop a course which connects the study of mathematics with its use, adequate provision being made for those whose special abilities or future interests relate to mathematics. . . . In connection with history, civics, literature, and art, an effort will be made to ascertain whether translations of the ancient classics, the records, and other materials of past civilizations cannot be effectively used in presenting the really significant contributions of the past. . . . By means of such subjects and activities the Lincoln School hopes to discover whether an education based upon *realities* is not only consistent with high intellectual, social, spiritual ideals, but whether it is not the most effective way of organizing the pupils' capacities and interests."

**CHANGES IN PUBLIC EDUCATION TO MEET WAR NEEDS.** In common with other institutions the schools have been greatly affected by the war. The influence of these unusual requirements is manifested in various ways. In the high school and upper grades of the elementary school there has been a strong tendency for boys to drop school and begin service on the farm or in the industries. In some States the enrollment of high school boys has decreased as much as 15 per cent.

A committee of prominent school officials offered the following statement of principles and recommendations to the Council for National Defense:

"In the crisis that confronts us the schools of the Nation should have the single thought to serve their country in the best possible way and to the full extent of their resources, not only in the present emergency but in the years to follow.

"Present conditions demand a statement of the principles which should guide those responsible for the conduct of secondary education.

"We accordingly believe, first, that it is of supreme importance that the educational resources of the nation, and particularly our great public school systems, shall be maintained as fully and completely as possible, in order that our country may not again go through the sad experiences following the Civil War, or

of some of the nations of Europe at the present time, and that the supply of trained and educated men and women may not be largely cut off during the war and after its close.

"We believe, second, that it is highly desirable that our schools and colleges shall furnish during the war a continuous supply of men fitted to take positions of leadership in the army, in the industrial world, and in social service, and that to that end students should be encouraged to continue their training up to the point of greatest efficiency rather than to enter service prematurely.

"We believe, third, that the schools should make any changes in their courses of study and methods of instruction that will fit their students to share more effectively in meeting the present crisis and our future needs.

"We believe, fourth, that in all schools special emphasis should be laid on instruction in thrift and in the avoidance of waste.

"I. We recommend that the school year be adjusted in each locality so that the schools may serve as effectively as possible both the children and the community at large under the changed conditions brought about by the war.

"II. To this end we recommend that in the larger cities and wherever else it may be possible to do so to advantage, the schools be kept open for educational and productive effort during the entire year, not only that children who may be called upon during part of the year for industrial service may have opportunity to attend school at such times as they are free, but also that the school equipment and teaching force for manual and industrial training and home economics may be available for the instruction of adults.

"III. We recommend that in agricultural sections the sessions of secondary schools be so fixed as to permit boys and girls to assist in agricultural operations with the least possible interruption of educational work. In the Northern States, where the crop-growing period is short, the summer vacation may be lengthened to include the periods of cultivation and harvesting of food crops. To compensate in part for this extension of the summer vacation, the holiday periods occurring during the school year may be shortened or eliminated. In those parts of the country where planting season begins early and the harvest season ends late, high schools may adjust vacations to coincide with the periods in which extra labor is demanded on the farms. In such cases the full amount of school work may be secured through mid-summer sessions or as suggested in Recommendation V.

"IV. We recommend that every effort be made to employ teachers of agriculture and home economics for the full year, and that their time during the summer months, and such other time as is not needed in school instruction, shall be utilized in supervising productive work of the boys and girls on the farm and in the home.

"V. We recommend that school officers take cognizance of the temptation to leave school which will be presented by the offer of high wages in the industrial pursuits. This temptation may in a measure be offset and the children kept under instruction by the organization of the schools wherever feasible on the part-time basis, as in Fitchburg, Cincinnati, and Spartanburg.

"VI. We recommend that boys attending secondary schools be advised not to enlist for military or naval service at present or in the immediate future, because the needs of the country will be better served by the assurance of an adequate supply of trained young men in the latter stages of the war and in the industrial reconstruction which must necessarily follow its close."

**LESSONS IN COMMUNITY AND NATIONAL LIFE.** President Wilson addressed a letter to school officers in which he urged "that teachers and other school officers increase materially the time and attention devoted to instruction bearing directly on the problems of community and national life." He stated that this was "a plea for a realization in public education of the new emphasis which the war has given to the ideals of democracy and the broad conception of national life." Mr. Hoover and Commissioner Claxton caused to be prepared and distributed suitable lessons in community and national life for the elementary grades and for the high school classes. These lessons were in very general use throughout the country. It is significant that this was the first time in our history that the youth of the entire United States studied the same lessons.

**EDUCATIONAL LEGISLATION.** In each State where the legislature met in 1917 laws were enacted to provide for vocational education in accordance with the Federal vocational education act. It was required of the legislature to accept the provisions of the Federal act, to provide a State board for the administration of vocational education, and to designate the State treasurer as the custodian of funds.

The most important school legislation affecting any one State was in New York. It was said of this law that "it organizes for a State a mass of legislation which would fill a tangled volume, reducing it to order and system." This law changes the unit of administration from the school district to the township. One board of seven members elected by the town has entire direction of all the schools of the town. The gross inequalities of the district system are avoided.

The new law gives to the cities a greater measure of home rule in school matters. In New York City a board of seven members appointed by the mayor takes the place of the large board that previously existed. The law makes the city superintendent the manager of the school system. The reorganization of the New York City schools is in accord with the recommendations of the Committee on School Inquiry supported during 1911-12 by the Board of Estimate and Apportionment.

**FOREIGN LANGUAGES IN THE ELEMENTARY SCHOOLS.** Since the declaration of war there has been much discussion regarding the teaching of foreign languages in the public elementary schools. In several cities where the German population was large German had been taught in all of the elementary grades. Among cities of 25,000 population or over, nineteen reported that some foreign language was taught below the seventh grade. In all but three of these cities German was the chief language taught.

There was a strong tendency to drop the study of German from both the elementary and high schools, and to confine the instruction in all foreign languages to the grades above

the sixth school year. The United States Bureau of Education gave the following suggested policy for the teaching of foreign languages in the public schools:

"There is general agreement among educators and public men, both in this country and abroad, that there should be no interference with the existing high school and college provision for the teaching of German; that a knowledge of the German language is more important now than it was before the war. The upper elementary, especially where organized as junior high schools, may quite properly offer foreign languages, including German, but educators generally look upon the teaching of foreign languages in the lower elementary grades as of very questionable value."

**MILITARY TRAINING IN THE PUBLIC SCHOOLS.** *The New Jersey Commission on Military Training in High Schools.* The report of this commission was submitted to the governor on February 5, 1917. In general the conclusions were against the adoption of military training in the high schools of New Jersey. Among the reasons assigned for this position were the following:

"There is no good reason for selecting high school pupils for purposes of military training. If any boys must be trained, all boys of the required age and strength should receive training."

"Compulsory military training in high schools will cause pupils who desire to evade it to leave school, and will thus serve to counteract all the agencies which tend to prolong school life."

"Military training in high schools has been proposed, not because it is wise, but because it is easy to use the machinery of the school system for the purpose."

"Boys of high school age can not successfully take up the strenuous work of real military training."

"Military drill is not advisable as a means of physical training. Thorough courses in physical training are better as giving a mental training for military service, and are surely necessary for all."

*Committee on Military Training of the Department of Superintendence.* The report of this committee was submitted to the superintendents during the early part of 1917. The more important of its conclusions and recommendations are summarized as follows:

The committee favored and recommended the adoption of a plan of intensive and specific military training for young men of nineteen years of age and over to be conducted during the twentieth and twenty-first years.

The committee opposed the introduction of military training and military drill, or any form of instruction which is distinctly or specifically military, into the elementary or secondary schools.

A thorough and comprehensive plan of physical training should be provided and made compulsory upon all boys and girls of all ages attending the schools.

Special attention should be directed to personal hygiene.

Provision should be made for instruction in sanitation and safety precautions for the purpose of guarding against disease and injury. For this purpose voluntary camp life during vacation should be encouraged, as well as outdoor exercises and hikes into the country.

**NEGRO EDUCATION.** During the summer of 1917 the United States Bureau of Education with the coöperation of the Phelps-Stokes Fund published a two-volume report on negro education. The report shows that "public schools for negroes have shared comparatively little in the educational advance that has taken place in the Southern States during the past fifteen years." Many of the school buildings were found to be unfit for school purposes. Failure to enroll and irregularity of attendance of colored children result in 30 per cent of the colored population being illiterate while a very large proportion of those who do attend do not complete the elementary grades until they are seventeen or eighteen years of age. The limited financial resources for the conduct of the negro schools are not sufficient to employ capable teachers. Nearly 70 per cent of the teachers of the colored schools in the South have had less than six grades of elementary education. The report asserts that the majority of the teachers are utterly incompetent of any responsibility.

The report summarizes the facts in regard to secondary education in the following conclusions:

"1. That the secondary schools are so few in number and so poorly equipped that they supply but a small fraction of the teachers required by the elementary schools for colored people.

"2. That the inadequacy of the elementary school system is such that the number of pupils prepared to study secondary subjects is not sufficient to use the secondary facilities, even of the private schools.

"3. That much of the secondary work done in the private schools is not planned to prepare teachers for the elementary schools nor adapted to the needs of the majority of the pupils.

"4. That a small number of the institutions for colored pupils have been among the pioneers in putting into effect the progressive ideals and methods that are now reorganizing American secondary education."

Each known public and private school for negroes is described and recommendations regarding the giving or withholding of contributions are offered. The present needs and recent movements in negro education are summarized as follows:

"1. That there is a pressing need for increased public school facilities for negroes. With increased public facilities, it is exceedingly desirable that the State departments of education invite the coöperation of all private institutions in the work of educating the negro. Initiative in this coöperation naturally rests with the State.

"2. That the aid of philanthropy be continued with the present liberality until the South has attained to a better economic condition. The effectiveness of this aid will be increased in proportion to the coöperation developed with public school authorities.

"3. That all education shall stress, first, the development of character, including the simple but fundamental virtues of cleanliness, order, perseverance, and the qualities essential to the home, and second, adaptation to the needs of the pupil and the community. This adaptation requires a leadership that has some grasp of the great historic movements of civilization. Only such a leadership for both the white and the black people can interpret the groups to each other.

"4. That supervision of both public and private educational efforts shall be increased, so that all agencies may be correlated with each other, sound business methods established, organization of work suited to income and plant, and building operations conducted with economy and good taste."

**VOCATIONAL EDUCATION.** The 64th Congress enacted a law to provide for the promotion of vocational education. This was approved by the president on February 23, 1917. The law provides for a Federal Board of Vocational Edu-

cation to consist of the secretary of agriculture, secretary of commerce, secretary of labor, United States commissioner of education, and three citizens of the United States to be appointed by the president by and with the consent of the Senate. One of the appointed members must be a representative of the manufacturing and commercial interests, one a representative of the agricultural interests, and one a representative of labor. As a representative of the manufacturing and commercial interests the president appointed James P. Monroe, as representative of the agricultural interests Charles A. Greathouse, and as representative of labor Arthur E. Holder. The Federal Board appointed Dr. Charles A. Prosser, president of Dunwoody Institute, as director.

The law provides a scheme of coöperation between the Federal government and the States for the promotion of vocational education in the fields of agriculture, trade, home economics, and industry and in the training of teachers in these subjects. The legislature of each State wishing to participate in the distribution of Federal funds must accept the provisions of the act and create a State board for vocational education. The State board is required to submit to the Federal board an outline of methods by which it proposes to conduct its vocational educational activities. If these are in conformity with the spirit and purpose of the act the Federal board authorizes the apportionment of money to that State. Prior to January 1, 1918, all but one or two of the States had accepted the provisions of the Federal Act. The total grant by the Federal government increases from \$1,860,000 in 1917-18 to \$7,367,000 in 1925-26. These appropriations must be matched dollar for dollar by the States and can be used only for payment of salaries and for the maintenance of teacher training. The apportionment for agricultural education is allotted to the States in the proportion which their rural population bears to the total rural population in the United States. The appropriations for paying the salaries of teachers of trade, home economics, and industrial subjects are allotted to the States in the proportion which their urban population bears to the total urban population of the United States. The appropriation for the training of teachers in vocational subjects is allotted to the States in the proportion which their population bears to the total population of the United States. In no case are the appropriations to be less than \$5000 each. By 1925 the minimum allotment to each State will be \$10,000, for each of the purposes specified. The State of New York has a total appropriation of \$154,210. This is the largest amount for any one State. Pennsylvania, with \$30,744.79, has the largest appropriation for agricultural education.

**TRAINING OF CONSCRIPTED MEN.** The War Department authorized the Federal board for Vocational Education to undertake schemes of training for conscripted men within the cities and schools coöperating with that board. This work is to be carried on in evening classes for conscripted men fitting them in part at home for army work. Such schools are known as "ground-work schools." The Federal board for Vocational Education supplies to the different State boards the statements of the needs in the different trades represented and an outline

or syllabus of courses that are to be given. The expenses of such courses are borne in part by the Federal Board for Vocational Education and in part by the State or city in which the courses are given. It is proposed to receive into such classes only those conscripted men who are in classes one and two and to leave such men as begin this work in their homes until they have satisfactorily completed the course. Industrial plants, as well as school laboratories, are utilized for the purpose of instruction.

**EGYPT.** A khedivate of northeastern Africa, virtually under the control of Great Britain and nominally under Turkish suzerainty until 1914, when it became a British protectorate. Cairo is the capital.

**AREA AND POPULATION.** Egypt proper includes the Libyan Desert, the territory between the Nile and the Red Sea, and the Sinai Peninsula; and is divided for administrative purposes into Upper and Lower Egypt. The area, exclusive of the Sudan, is given as 363,181 square miles, of which only 12,013 square miles are settled and under cultivation. The population in 1907 numbered 11,189,978, not including nomadic Bedouins, estimated to number over 97,000. By nationalities the population was made up as follows: 10,903,877 (10,366,046 sedentary, 537,831 nomadic) Egyptians, and 286,381 foreigners, of whom 69,725 Turks, 62,973 Greeks, 34,926 Italians, 20,853 British including Maltese, 14,591 French including Tunisians, 7704 Austrians and Hungarians, 2410 Russians, etc. Mohammedans numbered 10,366,826; Copts, 706,322; Jews, 38,635. Population (provisional figures) according to the census of March 6, 1917, 12,566,000.

In 1916 Cairo had 740,000 inhabitants; Alexandria, 405,882; Tanta, 58,957; Port Said, 61,380; Mehala el Kobra, 38,020; Mansura, 45,294; Assiut, 43,731; Damamhur, 46,555; Fayum, 41,606; Zagazig, 39,001; Damietta, 36,643; Minieh, 30,246; Akhmim, 26,966; Beni-Suef, 30,827; Menuf, 25,290; Shebin el Kom, 26,347; Mellawi, 22,947; Qena, 21,609.

**EDUCATION.** Primary education is conducted in maktabas, or elementary vernacular schools, some of which are under native management and some under the control of the ministry of education. Native education is completed at the Azhar University at Cairo, the principal university of the Mohammedan world. There are also government secondary, special, and technical schools, and professional colleges of law, medicine, education, and engineering. A national university, under entirely Egyptian management, has been founded at Cairo.

**AGRICULTURE.** Nearly all of Egypt's national wealth is derived from the growing and marketing of cotton. As a result of war conditions the price of Egyptian cotton reached a higher point during 1916 than has been known since the American Civil War. Egyptian cotton doubled in price during a period of several months in the fall of the year.

The internal commercial conditions of Egypt continued to prosper as a result of the war. In his note on the budget for 1917 the acting financial adviser stated that the public revenues have benefited to an un hoped-for extent as the result of the improvement in general economic conditions.

The cultivated areas of Egypt depend for their water supply on the extended irrigation and drainage system, which has as its base the large

dam across the Nile at Assuan. The cotton season is reckoned from September 1 to August 1. Deliveries for the 1915-16 season totaled 4,806,331 cantars (1 cantar = 99.049 pounds). This was about 55,000 cantars short of the estimate. The area under cotton cultivation was computed to aggregate 1,655,000 feddans (1 feddan = 1.03 acres), about 469,000 feddans more and some 120,000 less than the estimate for 1915 and 1914, respectively. Owing to unfavorable weather during the early flowering period of the plant, the ravages of the pink bollworm, and other parasites, the unit of yield per acre was 0.50 less than the average for the preceding 10 years. The area planted to cotton in 1910 was stated at 1,642,610 feddans, and in 1911 to 1,711,228—an increase of 68,618 feddans. Production, in 1911, of cleaned cotton, 3,318,529 metric quintals.

It has long been the custom in Egypt to devote acreage to cotton at the expense of the cultivation of needed breadstuffs, the deficiency having been supplied through importation of flour and cereals. Foreseeing the restricted supply of these staples in the world's markets as the result of the war a compulsory planting of cereals was imposed in 1915, and again on reduced scale during 1916.

As the results of these measures Egypt's needs of breadstuffs is believed to be assured for several years to come. Notwithstanding these precautions the average wholesale price of commodities produced in the country were fully 32 per cent higher than those of 1914.

The table below shows area (in hectares) and yield (in quintals) of staple products for 1917 (provisional) and 1916 (final):

	Hectares		Quintals	
	1917	1916	1917	1916
Wheat ..	451,833	585,669	8,119,687	9,945,529
Barley ..	180,007	177,595	2,960,714	2,609,910
Corn ....	702,010	748,815	18,733,613*	19,941,088
Rice ....	107,832	60,831	3,476,057*	2,586,868
Cotton ..	704,604	695,447	3,034,504*	2,704,847

\* Five-year average, 1911-15.

The area under sugar cane in 1915 was 21,921 hectares, or 108.2 per cent of the area in 1914, which amounted to 20,252 hectares and gave a production of 9,248,429 metric quintals of cane. The amount of sugar cane treated in 1913 was 741,000 tons, as compared with 537,000 in 1912.

A live stock table follows, for comparative years:

	1916	1915	Difference
Cattle .....	492,650	553,632	— 60,982
Buffaloes .....	515,121	538,109	— 22,988
Horses .....	34,403	35,015	— 612
Asses .....	526,181	546,707	— 20,526
Mules .....	17,268	21,611	— 4,345
Sheep .....	687,666	755,421	— 67,755
Goats .....	263,200	290,218	— 27,018
Pigs .....	8,580	7,259	+ 1,321
Camels .....	94,911	109,049	— 14,138

**COMMERCE.** In the following table are given imports and exports of merchandise in thousands of pounds Egyptian:

	1910	1912	1913	1914	1916
Imports ..	23,553	25,908	27,865	21,725	30,854
Exports ..	28,944	34,574	31,662	24,092	37,462

A table of principal articles of trade, values in thousands of pounds Egyptian for 1916, follows:

<i>Imports</i>		<i>Exports</i>	
Textiles .....	9,644	Textiles .....	30,098
Fuel .....	5,738	Cereals, etc. ....	4,467
Spirits, etc. ....	2,841	Metals, etc. ....	198
Cereals, etc. ....	1,480	Animal prods. ....	685
Drugs, etc. ....	1,418	Tobacco .....	262
Chem. prods. ....	1,255	Drugs .....	680
Animals, etc. ....	2,164	Skins, etc. ....	419

Trade with the principal countries of origin and destination is shown in the following table in thousands of pounds Egyptian (£E = \$4.943):

<i>Imports:</i>	1910	1912	1913	1914	1916
United Kingdom	7,311	7,991	8,496	7,061	15,070

\* British possessions in the Mediterranean.

† British possessions in the Far East.

‡ Including Algeria.

Although Egypt's need and ability to purchase in foreign markets was perhaps greater during 1916 than at any time during recent years its requirements could not be fully supplied, owing to the many restrictions placed on exportations by European countries and the United States, and to the lack of transportation facilities.

Imports from Spain show an actual increase in quantities over 1915. Imports from Greece decreased in both quantity and value owing to the unsettled conditions in that country. Egypt is an easily accessible market for Greece, and its business in tobacco, fresh edible stuffs, etc., is considerable in normal times. Imports attributed to Germany, Austria, and Turkey are parts of prize cargoes captured during the first year of the war and sold under orders of the local British Prize Court during 1916. Japan has begun to supply many manufactured articles formerly imported from Germany and Austria. The Director General of Posts, in his report for the year 1916, states: A novel feature was the arrival of 27,168 parcels from Japan, as compared with 877 in 1915. Although imports into Egypt from the United States during 1916 show an increase in value, there was a decrease in actual quantities.

The exports of greatest value were cotton and cotton-seed. In 1915, 1,379,426 bales of cotton (1 bale equaling 500 pounds), valued at \$95,536,764, were exported, as compared with 1,083,387 bales worth \$148,770,273, in 1916; shipments of cotton seed for the same periods were 16,597,056 bushels, worth \$11,734,904, and 9,819,468 bushels, valued at \$9,475,296.

An unusual feature of the exports during 1916 was the increase in refined sugar. While Egypt has always exported a certain quantity of refined sugar, the product of a monopolistic concession made from locally grown cane and imported East Indian brown sugar, it was not until the last months of 1914 that the quantities

began to assume interesting proportions. Custom statistics show that the average annual exports of refined sugar from Egypt for the years 1909-13 were valued at \$604,370; while the shipments for 1914 were \$1,146,258; for 1915, \$2,862,314; and for 1916, \$3,196,794. Italy and France are the countries that have taken the increased exports of sugar, the augmented markets for Egyptian sugar having been created through the cutting off of other sources of supply.

There was no change during 1916 in the conditions that militate against an unhampered extension of the market for American manufactures in Egypt. The lack of proper steamship connection was still the paramount obstacle. Given sufficient freight facilities, the United States might have supplied to a very large extent the needs of Egypt for 1916 in many lines.

The declared value of the exports to the United States from all of Egypt during 1916 amounted to \$29,226,289, against \$25,674,723 for 1915, the increased values being due entirely to augmented prices. With the exception of ivory and cigarettes, exports show a decrease in quantities.

The exports of raw cotton from Egypt to the United States during 1916 as shown in the declared export returns represent invoice values f.o.b. Alexandria at actual price received under the contract made from three to six months before date of shipment; such values aggregated \$27,968,063. Egyptian customs statistics for these same exports show a value of \$33,985,982. The difference is explained by the fact that for the purpose of customs valuation the price of cotton exported during any current month is based on the average daily price at Alexandria for the preceding month and does not take into consideration the actual sale price.

Returns of the maritime movement in Egyptian ports and the Suez Canal for 1916 reflect the greatly disturbed conditions of ocean traffic. The tonnage arriving at Alexandria and Port Said during 1916 was fully 76 per cent less than during 1914. Suez Canal returns for 1916 show tonnage amounting to 7,274,627 as passing through the canal, a falling off of over 40 per cent from the traffic during 1914.

COMMUNICATIONS. There were 2076 miles of state railway in operation March 31, 1916. In addition there were 840 miles of light railways—the Egyptian Delta Light Railways, the Chemins de Fer de la Basse-Egypte, and the Fayum Light Railway. There is also the Sudan military railway to Khartum, 375 miles long.

FINANCE. The budget for 1916-17 was estimated to balance at £E16,630,000. Revenue and expenditure for three years are shown in the table below:

	1913	1914-15	1915-16
Revenue ..	£E17,368,616	£E15,890,918	£E17,759,418
Expend. ..	15,728,785	16,857,783	16,594,660

The total outstanding debt January 1, 1916, amounted to £ (sterling) 93,903,240, and the annual charge for interest and sinking fund to £E4,604,061.

GOVERNMENT. Ahmud Fuad, with the revived title Sultan of Egypt, is the reigning monarch. High commissioner for Egypt, Sir Reginald Wingate.

By firman of February 13, 1841, the office of

vali, or governor, was made hereditary in the person of Mohammed Ali (1805-48) under the title khedive, subsequent rulers being Ibrahim (1848), Abbas I (1848-54), Said (1854-63), Ismail (1863-79), Tewfik (1879-92), Abbas (II) Hilmi (1892-1914). There is a council of ministers appointed by the sultan with a president who acts as prime minister. The various ministers prepare drafts of administrative decrees, which are submitted to the council. When approved and signed by the sultan these decrees become law. The British Financial Advisor attends the meetings of the council, but has no vote. There is a legislative council of thirty-nine members and a general assembly consisting of the Legislative Council, the Council of Ministers, and forty-six members elected by the people. These bodies are mainly consultative, the legislative power resting with the sultan and his ministers. See *ARCHÆOLOGY*.

The Sultan Hussein Kemal died on October 9. He was one of the sons of the Khedive Ismail; born in 1854. He passed his early life in France at the court of Napoleon III, and later, returning to Egypt, became minister of finance and minister of war, but after 1882 he retired from political life. On December 19, 1914, he was chosen by the British Government to succeed the deposed Khedive Abbas Hilmi and was thus the first khedive to govern under a British protectorate. His successor was Prince Ahmed Fuad, his brother. The new khedive was born in 1868, educated at Turin where one of his comrades was the King of Italy—Victor Emmanuel. He had had no part in public life. His sympathy was for the Italians and he surrounded himself with Italian officials. He was popular in Italy and had been chosen as the Italian candidate for the throne of Albania, which was finally bestowed upon the Prince of Wied. Before his accession he had lived quietly and had been chiefly interested in science and letters. He was president of the geographical society of Egypt and of the Egyptian University. He made his official entry into the Abdin Palace on October 11.

**EL DORADOITE.** See *MINERALOGY*.

**ELEANORE, QUEEN OF BULGARIA.** Queen Eleanore, the second wife of King Ferdinand of Bulgaria, died at Sofia on September 12, 1917. She was the Princess Eleanore Caroline Gasparine Louise, daughter of Prince Henry IV, of a younger branch of the Reuss-Kostritz house of Reuss, a small German state, where she was born fifty-seven years ago. She was married to King Ferdinand in 1908. She was known as the Royal Nurse of Europe on account of having cared for wounded soldiers in the hospitals during the Russo-Japanese and Balkan wars. In the spring of 1914 she planned to make a tour of the United States in order to let the American people know how the Bulgarian people suffered during the Balkan wars. The proceeds of the tour were to help alleviate the suffering. The unrest of that year, however, caused the postponement until October, 1914. The outbreak of the great European conflagration caused the abandonment of the scheme.

**ELECTORAL REFORM.** Although nearly all the State legislatures were in session in 1917, few of them passed important measures relating to electoral reform, and those which were enacted related for the most part to the question of woman suffrage, or the voting of citizens absent from the State in the government service.

The legislatures of North Dakota, Indiana, and South Dakota proposed constitutional amendments granting suffrage to women conditioned upon a referendum. The Connecticut and Iowa legislatures referred similar amendments to the next session of the legislature. Ohio, Michigan, and Rhode Island extended to women the right to vote for presidential electors, and Indiana and Nebraska extended this right to all officers not specified in their constitutions. In Vermont, women tax payers over 21 were granted the right to vote in town meetings. The Kansas Legislature proposed a constitutional amendment to deprive aliens who have declared their intention of becoming citizens of the right to suffrage.

The legislatures of Illinois, Nebraska, Minnesota, Missouri, and Wisconsin passed measures providing for the obtaining of the ballots of men absent on military and naval service. Eleven States provided for the voting of all those who may be absent from their home precinct, in either general or primary elections. The Wisconsin Legislature extended the absent voting law to all who are sick or physically disabled and so unable to attend the polls. A similar measure was passed by the legislature of Indiana. In Missouri additional provision was made for the voting of traveling salesmen at primary elections.

Presidential Primary Acts formerly passed were repealed by the legislatures of Minnesota, Iowa, and Michigan. In Tennessee, a compulsory system of party primary elections was provided for. In New Jersey, the nominations for public officers, with the exception of candidates for presidential electors, was forbidden save by convention. In South Dakota, there was initiated the unique primary law for submission to the people. This provided for party campaign pamphlets to be printed by the State. Presidential candidates and candidates for the governorship within the party must appear in one and sixteen joint debates respectively, in the State or cease to be candidates for their party. Party electors may propose independent candidates. By petition, the independent candidate may further file a "paramount issue" of eight words or less with the secretary of state. This issue will appear on the ballot and the independent candidate must challenge the representative candidate to joint debate on this issue. A jury of his party may recall an elected candidate when he fails to observe the principles on which he was elected, or is guilty of misconduct.

The legislatures of Illinois and Missouri forbade the printing of anonymous campaign matter. In Massachusetts it is required that a candidate nominated by some one other than a political party may not use the name of the party in his political designation. In Nebraska candidates are prohibited from running for nomination in the same office on two party tickets, and from accepting the minority nomination if he loses that of the majority party, unless his minority party votes exceed his majority party votes. In Illinois, candidates are prohibited from pledging themselves in return for support on penalty of fine or imprisonment and forfeiture of office.

The Nebraska legislature enacted a novel law for eliminating presidential electors from the ballots. The governor is required to appoint, as presidential electors of the State, those electors

nominated by the party whose candidate for the president and vice-president—the name appearing on the ballot—receive the highest number of votes. In Nevada, Nebraska, and Wyoming, non-partisan ballots are required for the election of judges and certain school officials. In Oregon, primary ballots must be printed with the name of the candidates in as many different rotations as there are candidates, thus placing each name at the top of the list on practically an equal number of ballots. In West Virginia and Nebraska double election laws were created, one to receive and one to count the ballots. The Illinois Legislature created a non-partisan commission to revise the election laws.

**ELECTRICAL INDUSTRIES.** The growth of electrical industries in the United States in 1917 was notable not only on account of the actual increase in the amount of business done, but also in the changes produced by the war in particular lines. Central stations were called upon for a great increase in the production of energy for lighting purposes on account of the large number of factories that were operating on night shifts. The difficulty in procuring new machine tools and in fact all kinds of machinery for new factories and munition plants made it necessary in almost every instance to operate these establishments continually. While calling upon the central stations for larger output during the usual evening hours that constitute the time of maximum demand in the shape of a lighting load, this necessitated the use of electricity during the latter part of every night and thus had the advantage of maintaining the load factor at a more uniform point. The industry in general, particularly towards the close of the year, was seriously hampered by the shortage of fuel existing at many points, rendering it necessary in some cases for central stations to curtail their operations in order to conserve the coal supply.

The application of electric power for welding processes in machine shops and factories increased to a notable degree. The introduction of heating and cooking devices for domestic use was also a marked feature of the year. Systematic publicity campaigns were widely carried out but in many cases with results depending largely upon the prevailing prices for energy. It was reported that at the end of the year there were more than 14,000 electric ranges in use. The opinion prevailed, however, that where the charge for energy was higher than five cents per kilowatt hour there was no advantage in the use of the electric range as compared with that heated by gas or coal.

A well known authority whose figures have always been regarded as conservative estimated that the gross earnings of the various branches of electricity in the United States during the year 1917 would total nearly \$3,000,000,000 as shown by the following table:

#### ELECTRICAL INDUSTRIES IN THE UNITED STATES—1917

Central stations .....	\$550,000,000
Electric traction .....	800,000,000
Telephony .....	425,000,000
Telegraphy .....	175,000,000
Isolated plants .....	150,000,000
Electrical manufacturing .....	600,000,000
Miscellaneous .....	125,000,000
Total.....	\$2,825,000,000

**ELECTRIC LIGHTING.** Electric lighting during 1917 was characterized by development in special directions. As referred to in the 1916 YEAR BOOK considerable progress had been made during that year in the application of scientific principles of illumination of city streets. This progress was maintained during a part of 1917, but towards the end of the year the necessity for coal saving was so urgent that not only were many plans for improved street lighting temporarily held back, but those systems that were already in existence were utilized at not much more than half their full capacity for this class of illumination. As had been the case in the preceding year the gas filled tungsten lamp was rapidly replacing even the best forms of arc lamps for street illumination. One of the most notable ways in which improved lighting was utilized was in the protection of factories, munition plants, and public structures of all kinds. Even early in the year, before the United States formally entered the war, many munition plants, as well as central stations and other public utilities, began applying systems of flood lighting in order to render approach by spies or other ill-disposed person to their plants difficult. The results achieved were so satisfactory that the manufacturers of electric lighting apparatus of all kinds were kept busier than ever before to supply the demand for protective flood lighting apparatus. By means of reflectors properly placed it was possible to illuminate a given area so clearly that any unusual happening or an attempt at approach to the building, bridge, or dock should be instantly detected by the guards who had charge of the same. For moving picture purposes there were new styles of tungsten lamps developed for use where the area of the screen was small and the projecting apparatus could be placed reasonably near the same as would be the case in large rooms and small lecture halls. A mazda lamp having a special design filament was brought out for this purpose, the lamp using four flattened coils instead of the usual tungsten filament and being filled with an inert gas, preferably nitrogen. Their energy consumption was approximately 600 watts at 30 volts and its effects aided by a spherical mirror at back and a powerful condensing lens at the front were entirely satisfactory. For the measurement of illumination a portable instrument called the foot-candle metre was brought out and widely used owing to the fact that it lent itself to the direct reading of brightness not only by an expert but by any person of ordinary intelligence. The instrument was constructed with a scale marked directly in foot-candles along which was a series of small discs which by suitably changing the voltage of a test lamp supplied with the instrument could be brought to the same degree of illumination as that furnished by the source whose intensity was to be measured.

**ELECTRIC POWER, TRANSMISSION OF.** Owing to the war there were no new undertakings in the construction of transmission lines for electric power; nor was there any change proposed in the maximum voltage used on such lines. The amount of business supplied by the various central stations feeding long distance lines was, of course, increasing and many of them were loaded practically to their capacity. As an instance of this it was suggested that the legislature of the State of New York take steps

to authorize the utilization of an additional amount of power from the Niagara River at Niagara Falls in order to increase the capacity of existing electro-chemical manufacturing plants at that point whose operation was so vital to the successful prosecution of the war. At the close of the year, however, it was very doubtful whether this plan would be carried out as the interests that formerly opposed any further commercial utilization of the falls were still exceedingly active in their opposition to the scheme on account of the unavoidable destruction of the scenic beauty of the place. In another direction, however, manufacturers were enjoying the advantages of a closer inter-connection, or, as it is called in England "interlinkage" of various electric power systems. By the installation of switching stations equipped with modern high capacity apparatus it was possible to supply power from any steam or hydro-electric station to almost any part of the system connected in a network of this kind, their lines in some instances extending for many hundreds of miles. In New York State, as well as in California, this inter-connection of electric power systems was carried out on an extensive scale, rather more so than in any other part of the United States, rendering it possible to carry on operations at manufacturing plants with electric power derived from distant hydro-electric plants when owing to the coal shortage the nearest central station to the plant referred to was unable to furnish energy at more than a small fraction of its capacity.

There was an increase in the amount of "out-door" apparatus installed for switching and other purposes on high tension transmission lines, and the design of such outfits was brought to comparatively simple standards. Transformers, switches, and similar equipment were quite commonly placed outside of sub-station buildings irrespective of the climate of that particular locality, the manufacturers having made it possible to guarantee the performance of these devices under all conditions of weather.

There was some further increase noted in the use of large synchronous machines as condensers on long distance lines. Under the war conditions prevailing it was difficult, and in many cases impossible, for manufacturers to supply generators or motors for any large undertakings outside of those devoted to government work. And the same state of affairs existed in regard to wire, cables, and insulators, the major part of which product was practically absorbed by government orders early in the year. In this connection also, while but few details were given out for publication, it was generally understood that a large amount of generating and transmission apparatus was manufactured and sent to France for use in the districts occupied by the Allied armies for the numerous purposes of power generation and transmission so indispensable to the fighting forces.

In connection with the distribution of electric energy by central stations, the experience of the year 1917 showed conclusively the need of further development of the natural resources of the United States in shape of water powers. It was estimated that the still undeveloped water powers amounted to about 50,000,000 horsepower and that by a more liberal policy on the part of the government this could be brought into use for public purposes by a more encouraging attitude towards industries and power plant owners.

The decision of the matter was at the close of the year still in a very uncertain state and there was but little hope that the attention of Congress could be sufficiently attracted to produce very tangible results during the ensuing year.

**ELECTRIC RAILWAYS.** Electric railway development during the year measured by new mileage was very slight. Near Philadelphia the Pennsylvania railroad was proceeding with the electrification of its suburban line from Philadelphia to Chestnut Hill, Pa., though this was not completed at the end of the year. The most pronounced feature of electrification of steam railways was the general satisfaction of operating officials with the service furnished by electric locomotives hauling both passenger and freight trains.

The electrical equipment of the Chicago, Milwaukee, and St. Paul Railroad had been in use a sufficiently long time to demonstrate its capabilities under all conditions of weather and with all kinds of traffic. While it was said at first that the men who had been running steam locomotives were somewhat unwilling to be instructed in the operation of electric locomotives, it was found that after a surprisingly short time under the supervision of competent instructors, these men were loudest in their praise of the electric locomotives.

The electric engine demonstrated its ability in the coldest weather to pull its maximum load so that there was never any necessity, as had always been the case with steam locomotives for diminishing the tonnage of freight trains over the steep grades of the mountains traversed by the St. Paul Railway.

On the Norfolk and Western Railway, the alternating current three phase locomotives that had given such excellent satisfaction in hauling coal trains from their first application on this line continued the good work and were increased by the addition of several more.

The Pennsylvania Railroad built during the year a locomotive designed for high speed freight service. It resembled those in use on the Norfolk and Western in that it was composed of two units, and each unit of the Pennsylvania engine was mounted upon three driving axles which were driven by alternating current motors deriving their energy from an overhead trolley wire at 11,000 volts. Owing to the comparatively short line equipped with this system on the Pennsylvania road, there was not much opportunity to test this locomotive in actual freight service, but it was found to be capable of developing 7000 horsepower for one hour and 4000 horsepower continually, thus making it the largest and most powerful electric locomotive in the world. The satisfactory operation of electric locomotives for trunk line railroads demonstrated further the vast possibilities in the further developments of water power. A writer in one of the technical journals estimated that the steam locomotives of the United States consumed about one-quarter of all the coal produced in the United States and developed 50,000,000 horsepower. This is about the amount of energy that has been estimated to be still capable of development in this country. Based upon figures of our average coal production it can be shown that complete electrification of all the railways in the United States would conserve 150,000,000 tons of coal.

In spite of the war conditions existing, a num-

ber of the English railways were considering the adoption of electric power as soon as the war should end, and although electrification had made but limited headway in that country during the last few years, the experience with it had been so uniformly satisfactory that the decision of the English managers was not at all surprising. Plans looking to the same end were also under way in France, Switzerland, and Italy. Even during the existence of war there was a further application of electric power during the year to the line of the St. Gothard Railway running through Switzerland and northern Italy.

**ELECTRO-CHEMICAL SOCIETY, AMERICAN.** See **CHEMISTRY, INDUSTRIAL.**

**ELEMENTARY SCHOOLS.** See **EDUCATION IN THE UNITED STATES.**

**ELEVATORS, GRAIN.** During 1917, there was completed for the Chicago and North Western Railway a large reinforced concrete grain elevator on the Calumet River in South Chicago, designed to have an ultimate capacity of 10,000,000 bushels. It was of fireproof construction and included a freight yard for 1250 cars and an engine terminal. The plant included a working house, a river house, storage tanks, and other auxiliary facilities. The working house was 235 ft. by 77 ft., 192 ft. high, and above its first story, which contained the machinery, there were 95 reinforced concrete bins, 15 ft. in diameter by 74 ft. high with a capacity of 931,000 bushels, and above the bins was a cupola several stories in height. Adjacent to the storage house was a receiving shed in which cars on five tracks could be unloaded. The working house had a capacity for handling 1,250,000 bushels of grain in 24 hours. The storage house consisted of 104 reinforced concrete bins, 22 ft. 6 in. in diameter by 104 ft. high, with a capacity of 4,383,000 bushels. The river house consisted of a first story 18 ft. 9 in. in height supporting 24 grain bins similar to those in the storage house and having a total capacity of 778,000 bushels. The river house was equipped for loading grain into boats and a large marine tower for unloading ships. The entire plant was carefully planned and consisted entirely of reinforced concrete or steel frame construction covered with wire mesh and plaster.

The Pennsylvania Railroad before the close of navigation on the Great Lakes put into operation at Erie, Pa., a new steel concrete elevator consisting of 30 reinforced circular tanks, 18 interstice tanks, and 22 side and pocket bins affording a total capacity of 1,156,400 bushels. This elevator was absolutely fireproof and had powerful car pulling machinery for placing the cars, of which 150 could stand on adjoining tracks. The machinery is operated electrically and electric lights are used throughout. It was capable of unloading grain at the rate of 25,000 bushels an hour. The first cargo which was elevated and transferred to cars consisted of 101,000 bushels of wheat. As the Port of Erie involved a shorter lake trip than Buffalo the new elevator was considered of considerable assistance in the prompt moving of the northwest wheat to the seaport.

**ELGIN (and KINCARDINE), VICTOR ALEXANDER BRUCE,** ninth Earl of. A British statesman and administrator, died at Broomhall, Dunfermline, January 18 1917. Descended from Robert the Bruce of Scotland, he was born in 1849 at Monklands, near Montreal, while his father, the

eighth Earl, was Governor General of Canada. His education was gained at Eton and at Balliol College, Oxford, where he took the M.A. As a boy he succeeded his father in 1863, and settled in Scotland, where he was long chairman of the Scottish Liberal Association. Since 1886 he has been lord lieutenant of Fifeshire. In the Gladstone ministry of 1886 he served as Treasurer of the Household and then as First Commissioner of Works, but it was not till he was sent to India as viceroy in 1894 that he gained an international reputation. His father had been viceroy thirty years before. During the five years Lord Elgin held office the country suffered from frontier wars and financial troubles, and earthquakes, plague, and famine, kept the people constantly restless. The viceroy was successful in relieving distress and restoring order and in advancing public works projects. He was rewarded by being created Knight of the Garter. In 1902 he was chairman of the royal commission appointed to investigate the conduct of the South African War, and from 1905 to 1908 he held the post of Secretary of State for the Colonies. Afterward, as chairman of commissions to deal with the ecclesiastical situation in Scotland, he performed valuable service. Lord Elgin, besides, acted as chairman of the Carnegie Trust. He received various decorations and degrees and in 1914 was chancellor of Aberdeen University. He declined a marquise.

**EMBARGO.** See **UNITED STATES AND THE WAR.**

**EMERGENCY FLEET CORPORATION.** See **SHIPBUILDING; and SHIPPING.**

**EMORY, WILLIAM HEMBLEY.** An American naval officer, born in Washington, D. C., on December 17, 1846, died on July 15, 1917. He was graduated from the United States Naval Academy in 1866. He was almost continuously at sea until 1884, serving among other duties as aid to Admiral David Porter. Promoted during the various grades he became a captain in 1901 and rear admiral in 1906. His commands include the *Bear* (1884), the *Despatch* (1885-86), the *Thetis* (1887-89), the *Petrel* (1894-96), the *Yosemite* (1898-1900), the *Monongahela* (1901), the *Indiana* (1901-03), and the *Hancock* (1904-06). He also served at the Naval Academy and the Naval Observatory and was naval attaché in London. In 1907 he commanded the Second Squadron of the Atlantic Fleet, and in the following year was retired.

**ENGINEERING.** The entrance of the United States into the ranks of the belligerent nations meant that all the resources of a country that had been active in all phases of engineering and manufacturing work now were to be applied directly to the problems of war. In other words, with the best engineering minds of Europe actively devoted to war, and war developments, the United States too was bringing to bear a wealth of talent which unquestionably would develop new methods and practices in military engineering, just as had been done in the civil engineering of the new world where many problems of construction had been solved. In the United States the erection of new buildings, bridges, and other work naturally was temporarily halted, save in so far as they concerned the manufacture of munitions and the provision of means of transportation to carry these products to the seaboard and the battle-front.

The first answer of the engineers of the United

States to the call to the colors was seen in the raising of volunteer engineer regiments. The engineer troops of the army, by an act of Congress, were increased in number and the existing battalions were subdivided to form the basis for new organizations. A large number of prominent engineers in various fields already had been enrolled and commissioned in the Officers' Reserve Corps, and immediately on the outbreak of war, they were assigned to the volunteer regiments as organized. The commanding officers and the adjutants were usually men from the United States regular army, but the line officers and the rank and file were made up of engineers and workers who were skilled specialists in various fields. Thus railway troops divided into regiments for construction, operation, and light railway workings were organized, as well as regiments for lumbering, forestry, quarrying, water supply, camouflage, wharf construction, gas and flame work, surveying, road making, and other fields, amounting in all to some 46,000 men. Some of these were among the first American troops to go to France, and the 11th United States Engineers in particular figured in the battle at Cambrai.

While not all the engineers in the United States obviously could go to the front, or engage as combatants, there was a vast amount of engineering work in connection with the war. Thus the mechanical engineering in connection with the Liberty Motor for the United States aeroplane and the Liberty Truck in the United States Army's Quartermaster's Department, were no mean achievement in engineering. (See AERONAUTICS AND AUTOMOBILES.) The work in SHIP-BUILDING (q.v.) also represented problems of engineering organization which was undertaken during the year with the promise of results rather than a record of actual accomplishments. In military engineering, the record as given under MILITARY PROGRESS (q.v.) showed a vast amount of work in all fields of applied science, while under NAVAL PROGRESS (q.v.), the construction of battleships and submarines involved engineering of a high degree.

ENGINEERING STUDENTS. A serious condition arose in connection with the draft, in that students in the engineering schools reaching the draft age, who had not completed their courses, were called to the colors under the terms of the Conscription Act. Many, if not the majority, of these students were anxious to enlist in the first place, but were urged by their instructors and members of the engineering profession, that their duty lay in remaining at their studies and preparing themselves for future usefulness. A number of students being drafted under such conditions, the seriousness of the matter was realized by the War Department, and means were provided whereby such students might be exempted from actual service during the time of their college work, but upon graduation, they would be subject to call by the army. It was believed at the end of the year that a satisfactory solution of this matter had been reached, although naturally the various engineering schools suffered a marked decrease in numbers through enlistment by students.

MILITARY ENGINEERING. The participation of the United States in the great war, lent additional emphasis to the recommendation of the Secretary of War that an enlarged army engineering school should be maintained to give an

intensive course to graduates of the United States Military Academy at West Point. Military engineering like other branches of engineering activity has so developed as to require proper and special preparation which for many years West Point had been unable to give, organized as it was on a somewhat elementary basis.

An Officers' Reserve Corps of civil engineers for the United States Navy was established in 1917, and an eligible list was formed by men suitable for such work along lines similar to that previously established in the United States Army. These men would serve in the Bureau of Yards and Docks of the United States Navy Department.

AMERICAN SOCIETY OF CIVIL ENGINEERS. A notable event in American engineering was the occupation by the American Society of Civil Engineers of its new quarters in the Engineering Societies Building, West Thirty-ninth Street, New York City. This took place officially on November 7, and was important in that under a single roof were housed the leading engineering organizations of the United States. The American Society of Civil Engineers gave up its own special building to join the other societies, and would benefit also in the joint engineering library, which is an important feature of the building.

A record of engineering in 1917 would deal rather with projects completed than with new works put under way. The completion of the Catskill Aqueduct (see AQUEDUCTS) marked the end of a notable work, which had been described from time to time in the YEAR BOOK, as was practically the case with the New York State Barge Canal (see CANALS). In bridge construction, three notable structures including the record Quebec Bridge, were finished, and a number of other works were also built (see BRIDGES). The record for DAMS (q.v.), while not including the large structures in previous years, is also summarized elsewhere, while for the increased commerce due to the war and to anticipated increases later, there were many DOCKS AND HARBORS (q.v.) and other port improvements under way. IRRIGATION AND DRAINAGE (q.v.) while not figuring to the extent of previous years, received attention, and FLOOD PROTECTION (q.v.) was an important topic in the Middle West of the United States. The railways as a result of the war had their own special problems, and while the construction was limited, yet the difficulties of operation due to congestion and inadequate equipment involved many difficulties of operation which are discussed under the article RAILWAYS (q.v.). The extensive use of AUTOMOBILES (q.v.) not merely for pleasure, but for commercial service, and particularly for long distance haulage especially with the congestion of the railroads, led to increased interest in ROADS AND PAVEMENTS (q.v.), and the matter really became one of national rather than local importance. WATER WORKS (q.v.) and purification figured not only in the ordinary developments of American and European cities, but particularly in the case of the army cantonments, for which adequate water facilities were provided in an incredibly brief space of time.

In municipal engineering, the municipal engineer was assuming a larger rôle, and in schemes of municipal government, municipal ownership and, CITY PLANNING (q.v.) distinct advances

were being recorded. In such special lines as sewerage and sewage treatment and garbage and refuse disposal, economies and sanitation were involved as never before.

While the war was not actually brought to the United States, yet the large number of fires in munition plants and conflagrations due directly or indirectly to hostilities, should have made the American people realize that FIRE PROTECTION (q.v.) was a subject of special concern, and that the destruction of munitions in a plant was quite as serious as on the battle-front, and the loss of foodstuffs burned in a grain elevator or warehouse was in effect but little different from their destruction by a submarine, while afloat. Consequently, the efforts of insurance engineers and fire engineers during 1917 were of special interest. One of the perennial problems in the United States was that of RAPID TRANSIT (q.v.) for which the great cities were constantly demanding greater facilities, yet never seeming to be satisfied. In 1917, important progress was made on the various lines under construction in Greater New York, while throughout the country, other projects were being developed or brought nearly to completion.

The activity of the chemical engineer and the research chemist by 1917 had gone a long way towards making the United States independent of Europe for various chemical materials and products. Under CHEMISTRY, INDUSTRIAL, there will be found a record of the extraordinary developments in this field which in many cases involved the establishment of new industries which never before had been successfully founded in the United States. Added to this the war required various economies of production and general efficiency and the utilization of home products in place of those previously imported. In fact, industrial chemistry was concerned in a remarkable degree with the industrial progress of the year, and also with the military operations themselves, new explosives, new poisonous gases, and new metallurgical processes being brought to the front.

The record for METALLURGY (q.v.), given elsewhere in this YEAR BOOK, was not one that showed striking progress except in efforts at production and the utilization of new methods that would accomplish this end. Electric processes for the refining of various metals, notably iron and steel, formed an important element in the year's record, but universally the needs of the war were the first consideration in metallurgical work and in the United States organizations for adequate production was the prime consideration (see IRON AND STEEL). In mechanical engineering, such topics as BOILERS, INTERNAL COMBUSTION ENGINES, STEAM TURBINES, and REFRIGERATION (q.v.), contributed their share to the record of the year. In electrical engineering the most notable advances were under ELECTRIC RAILWAYS and ELECTRIC LIGHTING (qq.v.). In the various engineering industries, however, great output was sought rather than innovations in method or processes.

**ENGLAND.** The largest and most densely populated portion of the United Kingdom. The term "England," especially when referring to the government, is sometimes used for "United Kingdom." See GREAT BRITAIN.

**ENGLAND, CHURCH OF.** Again in 1917 all great church questions in England were considered in their relationship to the great war.

The year saw the putting into concrete form the great spiritual movement, called "The National Mission of Repentance and Hope." This movement was the subject of speeches by the Archbishops of Canterbury and York in the latter months of 1916. The problem of the church was to adjust itself to the greater democracy brought about by the war and to rise to meet the needs of the soldiers and others whose views and religion had broadened as a result of the war. The keynote of the movement is a religion that will meet satisfactorily the new times and conditions. The church continued the practice of erecting wayside crosses or calvaries in memory of those who had died for their country. The church also continued an active campaign for the repeal of the Welch Church Act, the execution of which had been postponed until the close of the war. The revision of the Prayer Book seems to have been indefinitely postponed.

**ENGLISH LITERATURE.** See LITERATURE, ENGLISH AND AMERICAN.

**ENTOMOLOGY.** Because of the need for conserving food, there was especial interest in economic entomology in 1917 and while most of the results were rather too technical for a general summary, the publications of the State Boards of Agriculture as well as those of the Federal Department of Agriculture, can be consulted with profit. The house fly was the subject of a special bulletin published by Howard and Hutchinson in Washington, and in a pamphlet by Felt published by the New York State Museum. No remedies other than those earlier given were proposed (see YEAR BOOK for 1916). Smith stated that the parasitic hymenopteron, *Perilampus*, instead of laying its eggs in the body of its host puts them on leaves where they are either eaten by the host insect or hatch and crawl on to the host. According to Marchand the snow fly, *Chionea*, prefers to run about on the surface of snow, being repelled by a warm object, as, e.g., the hand. This may be explained on the assumption that mating is easier on the surface than it would be under the snow.

Some progress was made in the solution of the gypsy and brown tail moth problem, which was an acute one in Canada as well as in the United States. According to the report of the Dominion entomologist, gratifying results followed the use of parasites imported from the United States. It was interesting to note that the gypsy moth at one time appeared in England, but did not get a firm hold. The boll weevil problem is still serious. Hunter reported that no special treatment had been successful and advised combating it by fall plowing and cleaning fence rows. An early crop of vigorous plants is desirable, as these are less liable to be attacked. See COTTON.

Chambers stated that trypanosomes may be spread in regions free from the tsetse fly, by biting flies, the Tabanidae being the worst offenders.

Benedict studied the clothes moth, in the hope of discovering some way of moth proofing fabrics. The only clothes moth he found in New York City in four years was *Tineola biselliella*. The eggs are laid in June and July, from 40 to 50 eggs being the usual number, and the females die immediately after. The young hatch in 7 days, and begin to feed, some forming "tunnels" and others not forming permanent cases until they pupate. Camphor and naphthalene in closed places kill

the larvæ, and probably poisonous gases would do the same, though this he did not try. He was unable to find any substance with which cloth could be soaked that would kill the insects. Corrosive sublimate was tried, but without effect.

It was reported early in 1917 that the pink bollworm, *Gelechia gossypiella*, was established as a cotton pest in northern Mexico, the eggs having been imported in cotton seed from Egypt in 1910. Its original home was in India. The U. S. Department of Agriculture has established a strict quarantine to prevent the introduction of the insect along the Texas border. A similar introduction of this insect into Brazil occurred some years ago, and it was reported in 1916 that it had become a very serious pest, the yield of some fields having been reduced one half.

Wodseale reported some observations on the ability of insects to live without food, and found that in *Trogoderma tarsali*, one individual lived for 5 years, 1 month and 29 days, while some that were not fed at all after hatching lived for 4 months. If partly grown individuals are starved they will shrink to about the hatching size, but the original size may be regained if food is again given them. This process may be repeated several times.

McIndoo in the *Smithsonian Miscellaneous Collections* discussed the question of recognition among insects. His experiments were on the honey bee, and his general conclusion was that in these insects the hive odor is the most important of any. This is a composite odor, made up of the individual odors from all of the workers in the hive, and is supplemented by the odors from the queen, drones, comb, frames, and wall of the hive, etc. From this it is easily seen why no two hives have the same odor. The queen odor is evidently very important in the hive, for without the queen the workers become restless and irritable. Bees working in the field lose some of their hive odor, while if kept in a free current of air away from the hive for three days they lose the hive odor altogether. He thought that the ruling spirit in the hive is this hive odor, the queen odor component being of the greatest importance in maintaining harmonious relations in the hive. A later part of his paper is devoted to a list of the scent producing organs in the various insect orders. These are usually glands but other structures may function in this way. See Zoölogy.

**EPILEPSY.** Reed's contention that epilepsy is due to a toxemia produced by the activity in the intestine of a specific microorganism has been withdrawn by him. He declares, nevertheless, that the clinical results derived from surgical correction of chronic constipation and its consequent toxemia, impel him to continue his work with the hope that a specific cause may yet be discovered.

He says, "I directed my bacteriologic service to make a systematic examination of the blood in all convulsive cases which were presented for diagnosis. The result of this routine was that after several months I was furnished the data embraced in my report submitted to the Cincinnati Society for Medical Research. The organism there described was sent in the form of photographs, slides, and cultures, whenever requested, to various institutions and independent investigators with the request that each take up the investigation *de novo* with reference to confirming or disproving the findings which

I had published. Several investigators complied with my request, some with positive and other with negative findings. At the same time my own bacteriologic service went over its own work in a very painstaking way. As a result I have just had submitted to me the protocols of 578 observations, of which 491 were negative and 114 were positive. In a final series of thirty-six consecutive cases at the Sterling Hospital, all were negative. The report concludes with the statement: 'with a revised technic and modified surroundings, it has not been possible to confirm the observations formerly submitted to you.' In view of this finding, I feel it my duty at once to request that so much, but only so much, of my previous contributions as relate to the identity of a presumably specific organism and to the existence of an actual bacteremia in these cases may be considered as withdrawn."

**EPÍRUS.** An ill-defined district embracing southern Albania and northwestern Greece. Anciently Epirus was the northwesternmost division of Greece. After the Balkan wars of 1912-13, Greece annexed part of Albanian Epirus. In November, 1914, with the consent of the great Powers, Greece occupied the northern part of the district, and in March, 1916, formally took possession of it. The population is estimated at about 500,000, but this figure is probably excessive. The towns include Janina (about 16,800 inhabitants), Argyrocastron (12,000), and Koritsa (8,000).

**EPISCOPAL CHURCH.** See PROTESTANT EPISCOPAL CHURCH.

**EPIZOÖTIC LYMPHANGITIS.** See VETERINARY MEDICINE.

**EPWORTH LEAGUE.** See articles on Methodist denominations.

**ERITREA.** An Italian colony on the west shore of the Red Sea, with a coast line of about 670 miles and an estimated area of 45,800 square miles; population, 279,000. Asmara is the capital. Salt is an important product, being sent to southern Abyssinia where it is a momentary currency. Imports 1915, 23,623,490 lire. Exports, 14,005,201; transit 5,845,617. Tonnage entered, 356,258. There are 74 miles of railway. The railway from Massaua to Asmara was finished in 1911; it will be extended to Keren and Agordat. Estimated revenue (1916-17), 22,765,221 lire (state contribution, 17,440,000); expenditure, 22,765,221 (military administration, 4,865,449; civil administration, 17,899,772). Senator Nobile Giacomo de Martino was appointed governor in 1916.

**ESTHONIA.** A government of Russia, lying south of the Gulf of Finland and north of Livonia. Area, 7818 square miles; estimated population January 1, 1915, 512,500. The capital is Revel, a fortified seaport, which before the war had an estimated population of 137,600. The Esthonians number perhaps 1,200,000 of whom more than 400,000 live in Esthonia. Like the Finns, to whom they are closely related, they retain many characteristics which reveal their Mongolian origin. The Imperial Russian government made systematic efforts to Russify the Esthonians, trying especially to abolish the use of their Finnic language, to which they held tenaciously. Also the Orthodox church carried on an active propaganda in Esthonia, but according to the latest religious census about 96 per cent of the inhabitants were Lutheran. The dominant element of the population has long

been the nobility, chiefly of German descent, who up to 1878 owned more than half the land; but during the last quarter of a century there has been a marked increase in the number of peasant proprietors. It is stated that in Esthonia agriculture is practiced in a more scientific manner than in any other section of Russia. The chief agricultural products are oats, barley, rye, potatoes, and vegetables.

**ETHNOLOGY.** See **ANTHROPOLOGY.**

**EVANGELICAL ASSOCIATION.** A religious denomination principally composed of German-born citizens of the United States. Its doctrines are practically the same as those of the Methodists and its communicants belong to nearly all parts of the northern section of the United States and Canada. There are also many to be found in the West and South. The missionary work is chiefly carried on among Italian immigrants. In 1917 the denomination had 1056 ministers, 1625 churches, and 120,387 communicants. The church is divided into 24 districts for administrative purposes, has more than 180,000 pupils in the Sunday Schools, and a Young People's Alliance whose membership numbers nearly 55,000. A preaching house is maintained in Cleveland, Ohio, and there are several philanthropic institutions and hospitals in Chicago, Philadelphia, and cities throughout the Middle West. Northwestern College (q.v.), Napierville, Ill., is the leading educational institution.

The United Evangelical Church is a denomination of the same doctrinal beliefs and polity as the Evangelical Association. Last year it had a total membership of 89,920, 920 churches, and 950 Sunday Schools. The young people's societies and the missionary work both at home and abroad spent a very active and successful year. In 1917 there were approximately 310 home missions in operation and these missions had a church membership of almost 36,000 and a Sunday school enrollment of 61,500. The missionary work in China was very successful as was the first year of the theological school opened last year at Hunan. The leading educational institutions are Albright College, Western Union College, the Bible Teachers Training School, New York City, the Oregon Bible Training School, and the Illinois Training School for Christian Workers. The publishing house is at Harrisburg, Pa.

**EVANS, EDWARD PAYSON.** An American scholar, died in New York City, March 6, 1917. He was born at Remsen, N. Y., in 1831, but removed to Michigan in 1850. He took the degrees of A.B. and A.M. at the University of Michigan, to which, after some years of teaching and of travel and study abroad he returned to be professor of modern languages and literatures from 1862 to 1867. After 1870 he spent most of his time in Germany, where he joined the staff of the *Allgemeine Zeitung*, Munich, in 1884. He was also a contributor to various other German papers and to American journals. In 1873 he declined the chair of Sanskrit at the University of Lahore, India. Mr. Evans translated Stahr's *Life of Lessing* and Coquerel's *First Historical Transformation of Christianity* into English, and he wrote: *Animal Symbolism in Ecclesiastical Architecture; Evolutional Ethics and Animal Psychology; Beiträge zur Amerikanischen Litteratur und Kulturgeschichte* (2 vols.); *The Criminal Prosecution and*

*Capital Punishment of Animals.* In his later years he worked on a five-volume *History of German Literature* (in English).

**EVOLUTION.** See **ZOOLOGY.**

**EXPERIMENT STATIONS.** See **AGRICULTURAL EXPERIMENT STATIONS.**

**EXPLORATION.** The unknown areas of the earth received scant attention in 1917 from adventurous men, whose energies were primarily devoted to the war. Such explorations as have been made have turned rather to developing needful resources of remote regions rather than to the discovery of new lands. As might be anticipated the principal explorations have been carried on in the peaceful western hemisphere.

**AFRICA.** Explorations in southern Africa have been confined to reconnaissances connected with military operations, especially in the little-known interior of German East Africa. In the north the extension of the French railway has opened remote regions of Morocco to the world.

**ASIA.** Not only have no recent explorations been initiated on this continent, but the regular Russian hydrographic surveys of the Siberian waters have been discontinued. In connection with such work it is to be noted that the Russian government has formally annexed to Russia the archipelagos of De Long, New Siberia, and, Nicholas II, as well as Wrangell Land and the islands of Vilkitaki.

**EUROPE.** The construction of the railway from Petrograd to the Murman coast opens up regions on the Arctic coast, barely known.

**AUSTRALASIA.** The exploration of hitherto untraversed portions of the interior of Australia, completed in 1916, became available during 1917. The journeys over the vast, desert region of the interior, made by T. E. Day, former surveyor general, involved no less than 7000 miles of travel, camel transportation being largely employed. The object was to determine what part of the unknown regions were available for settlement,—pastoral or agricultural. The country thus explored lies between 21° and 26° N. lat., and from 131° to 138° W. long., embracing an area of more than 100,000 sq. mi. Nine tenths of central Australia is unoccupied, and the regions explored give small encouragement for settlement, owing to aridity, remoteness of markets, and lack of transportation.

The unknown parts of Papua (British West New Guinea) the second largest island of the world, have been the object of a second expedition by Dr. Arthur Wade. His last explorations covered 3000 sq. mi. of the coast, between the Purari delta and Yule Island. Following the Vailal River, which he surveyed en route, he reached its head-waters. There he found an inhabited region, occupied by the mysterious Kuku tribes. They have extraordinary customs as to methods of life, of dress, and of transportation.

**NORTH AMERICA.** This continent has been the field of operations of the Canadian Arctic Expedition, under Stefansson, and also of McMillan's (see **POLAR RESEARCH**), as well as of two expeditions of the National Geographic Society, in Alaska and in Labrador. The Labrador expedition was under the Carnegie Museum of Pittsburgh, the National Geographic Society coöperating. The work done by Messrs. W. E. C. Todd and A. Marshall was biological and geographic. Starting from Seven Island in April they returned in late October, after obtaining important and extensive results in their journey of about

750 miles. They traversed Labrador from south to north over regions hitherto unknown to the civilized world. In addition to their large collections they discovered several chains of lakes and connecting streams hitherto uncharted and unknown. These explorations solve some of the mysteries of interior Labrador.

The most notable expedition of the year was that sent by the National Geographic Society to the Katmai district, southeastern Alaska, under command of Dr. Robert F. Griggs, who had previously visited the region. The eruption of Mt. Katmai, in 1912, had completely changed the topography and physical conditions of the surrounding country. The expedition of 1917 explored and charted about 1600 sq. mi. of unmapped territory, and made complete collections of insects, birds, plants, and of geological specimens. The violence and force of the eruption of 1912 is indicated by the discovery that not only did Katmai blow off its head, but it left one of the largest craters in the world, more than 9 miles in circumference and 3600 feet in depth. The volcanic energy also broke up the surrounding country, leaving countless rifts and fissures through which are ejected at intervals steam jets to a mile high. These vents are practically numberless, running in number up to many thousands. Altogether it presents conditions far more striking than Vesuvius or any other known volcano of to-day. It is the wonder-land of America.

**SOUTH AMERICA.** The American Museum of Natural History, of New York, still continues its biological survey of South America. There are now available the results of the last three expeditions which, sent to that continent for zoological research, compiled much data and collected many specimens, especially of birds and mammals. The first expedition, under charge of Dr. Frank M. Chapman, made a general scientific reconnaissance in Ecuador, central Chile, and the Organ Mountains of Brazil. The second party, led by Leo E. Miller, collected extensive zoological specimens in northwestern Argentina, and in the regions extending from the west border of the Chaco to the summit of the Andes. The third expedition was in charge of George H. Cherrie, who explored the vast marshes of southwest Brazil. His work was a continuance of the researches of the Roosevelt expedition of 1913-14, with which Cherrie and Miller cooperated as representatives of the Museum. Dr. Hamilton Rice, the well-known explorer, renewed in 1917 his South American researches. He ascended the Amazon 2100 miles to the Solimoes, charting the navigable channel beyond Manaus, at the mouth of the Negro, to his farthest point at Iquitos, Peru. On his return he supplemented his explorations covering the Waupee tributary of the Negro (1907-08), by ascending that river 425 miles to Santa Isabel. Unfavorable conditions obliged Rice to confine his researches to the Rio Negro.

**MISCELLANEOUS.** Among expeditions to ascertain resources may be mentioned that of Prof. A. S. Hitchcock to determine the flora of the Hawaiian Islands. Of special importance, however, were the researches conducted under the direction of Director G. O. Smith, U. S. Geological Survey, to ascertain within the United States deposits of "war minerals" essential for the successful prosecution of the war. Among these were oil, manganeses, pyrites, chromite, tung-

sten, antimony, potash, and nitrate. The success of such exploratory-research was evidenced by the increase in manganese ore, which increased fourfold from 27,000 tons in 1916 to 122,000 tons in 1917. See **POLAR RESEARCH.**

**EXPLOSIVES.** See **CHEMISTEX, INDUSTRIAL EXPOSITIONS.** No important or international exposition was held during the year.

**PANAMA-CALIFORNIA EXPOSITION.** This exposition was held during 1916 in San Diego, Cal., and closed at midnight on January 1, 1917. The estimated attendance was 2,250,000 persons. The main building and the landscape effects were preserved and in 1917 they were being used as a naval training station.

**TRADE FAIRS.** The great trade fairs which for years have been held in Leipsic, Germany, and elsewhere have extended to other countries as noticed in the **YEAR BOOK** for 1916 (p. 211). Their special feature was the exhibition of samples and solicitation of orders. The third British Industries Fair was held in London, England, from February 26 to March 9. The total number of exhibitors was 440 and the exhibits were confined to toys and games, earthenware and china, glass, fancy goods, stationery, and printing. A fair of similar character was held in Glasgow, Scotland, during the same period. Also a Sample Fair was held in Sydney, Australia, during September. The third Sample Fair of Lyons was held from March 15 till April 1. There were 3159 exhibitors and there was an exhibit under the auspices of the Department of State of American catalogues and other trade literature. The tenth Sample Fair of Paris was held from May 14 till May 31 at which 1800 exhibitors participated. As contrasted with the Lyons fair, which is international, the Paris fair was reserved entirely for French exhibitors, although it was open to buyers from all countries except those with which France is at war. The second Bordeaux Sample Fair was held from September 1 to September 15.

A first Swiss Sample Fair was held in Basel, from April 15 to April 29 at which the exhibits consisted only of products of the textile industry, toys, watches and jewelry, machinery and electrical articles, chemical products, canned goods, chocolate, and dairy products, made in Switzerland.

The first Dutch Sample Fair ("Jaarbeurs") was held in Utrecht, Holland, from February 26 to March 10, with 670 participants. It was national in character and no foreign goods were admitted for exhibit. A permanent international exhibition of industrial products and articles of commerce of every description both domestic and foreign, is announced to be held in Amsterdam, Holland.

The usual fairs were held in Leipzig and that of August was the seventh war fair ("Kriegsmesse") and was conspicuous for the many substitute articles shown, notably those designed to take the place of linen, cotton, jute, and other fabrics many of which were described as "surprisingly successful." The Nizhni Novgorod fair this year was the "quietest ever held" and showed a decrease of manufactured articles, and from the Irbit (Russia) fair a similar experience is reported, the articles being confined almost exclusively to furs and skins.

**MINOR EXPOSITIONS.** The third Brazilian Fruit Exposition was held in Rio de Janeiro from January 18 to February 5. An Interna-

tional Cattle Exposition was held in Rio de Janeiro, Brazil, from May 13 to May 28 with a congress at which pertinent topics were discussed. A permanent annual exposition devoted to furniture, tortoise-shell work, and floriculture was opened in San José, Costa Rica, on September 15. An Industrial Exposition was held in Santiago, Chile, beginning September 17. An Exposition of toys and sports goods was held in Venice, Italy, from September 20 to October 31.

**MISCELLANEOUS.** The Pilgrim Tercentenary Commission proposed to hold an international exposition at Boston in 1920 or 1921 to erect a memorial hall on Cole's Hill, Plymouth, to present at Plymouth in a structure to hold 10,000 persons a historical pageant, besides altering and improving the present unsightly water front adjacent to Plymouth Rock and to establish there a beautiful public park. For the preliminary plans the Massachusetts legislature appropriated \$50,000 but the bill was vetoed by the governor.

The Mississippi Centennial Exposition planned to be held in Gulfport, Miss., during 1917-18, commemorating the centenary of the admission of Mississippi to the Union, was postponed owing to the war and the failure of Congress to appropriate funds for the government exhibits.

An exposition of science, arts, and industries commemorating the 300th anniversary of the settlement of the Borough of the Bronx in New York City was announced to be held during May 30-November 1, 1918. The site, consisting of 25 acres, is on the William Waldorf Astor property at East 177th Street and the Bronx River. For the display of artistic, scientific, and industrial accomplishments of the nations of the earth nearly a hundred buildings were being constructed and of these the larger in the Spanish Colonial style of architecture, including palaces devoted to American Achievements, Pan-American Exhibits, Fine Arts, Manufactures and Liberal Arts, Varied Industries, Horticulture and Agriculture, Machinery, Automobiles, etc. The amusement features were to be many. If this exposition should prove a success, like similar enterprises at Shephard's Bush and Earl's Court in London, it would be held annually in commemoration of some special event.

**EZEKIEL, MOSES.** A distinguished American sculptor, who had lived in Rome, Italy, for more than 40 years, died in that city March 27, 1917. He was born in Richmond, Va., October 28, 1844, and as a boy showed his artistic talent. He entered Virginia Military Institute, from which he graduated in 1866, having meanwhile served as a cadet in the Confederate army. To ground himself in anatomy he studied in the Medical College of Virginia. From Cincinnati, whither he had removed in 1868, he went the next year to Berlin, and there was a pupil of the Royal Academy and of Albert Wolf. A colossal bust of Washington brought him admission to the Berlin Society of Artists, and in 1873 he won the Roman prize, the first time it had been awarded to a foreigner. Meanwhile he had acted as a correspondent in the Franco-Prussian War. In Germany he became acquainted with Cardinal Hohenlohe and Franz Liszt, of both of whom he made busts that brought him decorations from the Grand Duke of Saxe-Meiningen. After 1874 Ezekiel made Rome his permanent home, becoming not only one of the most noted and

prolific sculptors in the city, but one of its most brilliant figures socially. His studio, in the Baths of Diocletian, was a rendezvous for distinguished visitors and for the finest artistic and musical circles. The sculptor was himself also a musician, pupil of Liszt. The quality of his work, high though it ranks, is not so amazing as the amount of it. His early "Religious Liberty" was placed in Fairmont Park, Philadelphia, after being shown at the Centennial Exposition. "Virginia Mourning Her Dead" is at the Virginia Military Institute. For the Corcoran Art Gallery, Washington, he designed 11 statues of famous sculptors and painters. His other subjects included such a variety as "Eve," "David," "Judith," "Christ," and "The Madonna"; mythological characters; "Columbus," "Robert E. Lee," "Lord Sherbrooke," "Napoleon I," "Stonewall Jackson," "Thomas Jefferson," "Farragut," "Longfellow," "Poe," and "Mrs. Andrew D. White." For the University of Virginia he designed a "Homer" group and for the Confederate cemetery at Johnson's Island, Ohio, a monument entitled "The Outlook." He was decorated by the German Emperor with the order Pour le Mérite in art, and by King Humbert and Victor Emmanuel. Vitality and freedom from conventional methods are characteristic of his work, which shows more German than classical influence.

**FAILURES.** See FINANCIAL REVIEW.

**FAIRCHILD, EDWARD THOMSON.** An American educator, died in Durham, N. H., January 23, 1917. He was born at Doylestown, Ohio, in 1854, and received his education at Ohio Wesleyan and Wooster Universities. Removing to Kansas in 1885, he served as regent of the State Agricultural College from 1889 to 1907 and then as State superintendent of public instruction till 1912, when he was appointed to the presidency of New Hampshire College. Dr. Fairchild received an honorary A.M. from the Kansas State Agricultural College and the Ph.D. from Baker University. He was a member of the National Council of Education.

**FALCONIO, DIOMEDE, Cardinal.** A Roman Catholic prelate, died in Rome February 7, 1917. He was born in 1842 at Pescocostanzo in the Abruzzi. At eighteen he entered the Franciscan Order in Italy. After five years he was sent to the United States, where he was ordained and became identified with St. Bonaventure's College at Allegany, N. Y., as professor and vice-president and in 1868 as president. For ten years before his return to Italy in 1883 he served as diocesan chancellor of the cathedral at Harbor Grace, Newfoundland. He held a number of offices in his order, including those of provincial in the Abruzzi and procurator-general, being chosen to the latter by the General Chapter in Rome in 1880. Cardinal Falconio was consecrated bishop of Lacedonia in 1892 and archbishop of Acerenza in 1895. Four years later he was appointed the first permanent apostolic delegate to Canada, and titular archbishop of Larissa, and from 1902 to 1911 he was stationed in Washington as apostolic delegate to the United States. During his earlier residence in this country he had become naturalized as an American citizen. He was made cardinal priest in 1911 and cardinal bishop of Velletri in 1914. A collection of his pastoral letters was translated into French.

**FALKLAND ISLANDS.** A British crown

colony in the south Atlantic. It is composed of the following islands: East Falkland (3000 square miles), West Falkland (2300), and about 100 smaller islands (totaling about 1200 square miles). South Georgia, a group of islands 54½° S., with an area of about 1000 square miles, a great whaling station, is a dependency of the Falkland Islands. Estimated population December 31, 1915, 3451. Sheep-farming is the sole industry of the colony, the entire country being wild moorland fit for little besides pasture. Horses numbered 3545, cattle 7800, sheep 691,000 in 1915. Hides, skins, horns, hoofs, bones, tallow, wool, and guano are the exports. Whale produce exported in 1915 was valued at £1,333,401, of which £889,128 from South Georgia. Imports and exports for 1915 were valued at £368,272 and £1,576,126 respectively (£93,913 and £471,156 in 1911). Revenue, 1915, £43,627; expenditure, £33,600. There is no public debt. The only town is Stanley, with about 950 inhabitants. It has a fine inner and outer harbor and is a coaling station for vessels rounding Cape Horn. The islands were taken by Great Britain in 1832 for the protection of the whale fisheries. Dependencies beside South Georgia are the South Shetland, Graham's Island, the South Orkneys, and the Sandwich group.

**FARMS AND FARM LABOR.** See AGRICULTURE.

**FARTHER INDIA.** See INDO-CHINA.

**FEDERAL COUNCIL OF THE CHURCHES OF CHRIST IN AMERICA.** The council officially unites in its activities thirty Protestant denominations, including 140,000 churches, with about 18,000,000 members. Its purpose is to unify the work of the Protestant churches in co-operation. It is authorized to voice the conscience of the Protestant churches on important matters and within proper limitations to act for them, without, however, interfering with their autonomy. Its national office constitutes a general Protestant headquarters and clearing house.

The lines of activities are indicated by the names of the commissions, which consist of about 100 men each, nominated by the thirty constituent bodies as follows: The Commission on the Church and Social Service, for action on social questions in the light of Christian principles; Commission on Evangelism, for united evangelistic work regulated by the churches; Commission on the Church and Country Life, for the conservation and development of rural churches; Commission on International Justice and Goodwill and Commission on Relations with the Orient, coöperating with the World Alliance for Promoting International Friendship through the churches, for the purpose of influencing international relations by the application of Christian principles; Commission on Christian Education, for bringing into coöperation all the educational boards of the churches for the consideration of such common matters as religious instruction in connection with the public schools; Commission on Temperance; and also special committees on Foreign Missions and Family Life and Religious Rest Day.

The Home Missions Council brings together the various home mission boards in the interests of effective distribution of missions and churches, and the Commission on Inter-Church Federa-

tions is engaged constantly in organizing federations of churches in local communities. The council maintains a publication department which in 1917 published and sent out over a million books and pamphlets relating to the unified work of the churches in the council. The various YEAB BOOKS issued complete ecclesiastical information and statistics.

On May 8 and 9, 1917, the Federal Council held a special meeting in Washington to consider the problems of the churches arising out of the war. In addition to the work of the above-mentioned commissions during the year 1917, important special movements, including a campaign for the conservation of human life, conservation of food, the institution of temperance among workmen, a nation wide movement for war relief and financial relief for suffering churches in France and Belgium, were carried on. In the interests of temperance, the council's commission has united with the National Temperance Society for an educational campaign, publishing three temperance periodicals. On Sunday, November 18, 1917, a representative of the council addressed the convention of the American Federation of Labor during its meeting in Buffalo on the topic, "Can the Labor Movement Stand for the Liquor Traffic?" The council maintains a staff in addition to the general secretary, Rev. Charles S. Macfarland, consisting of seven field and executive secretaries. The national office is in New York, and an office is also maintained in Washington and in several other cities.

**FEDERAL FOOD ADMINISTRATION.**

See FOOD CONTROL.

**FEDERAL GRAIN CORPORATION.** See AGRICULTURE.

**FEDERAL TERRITORY.** A territory of the Commonwealth of Australia, situated within the state of New South Wales. It was acquired by the Commonwealth government in 1910 from New South Wales as the site of the permanent Federal capital; the capital, named Canberra, was founded in 1913. It had not yet (1917) become the seat of the Commonwealth government, which remained temporarily at Melbourne, in the state of Victoria. Canberra is 204 miles southwest of Sydney, 429 miles northeast of Melbourne, and about 123 miles west of Jervis Bay. The area of the Federal Territory is 912 square miles. Estimated population June 30, 1916, 2472.

**FEDERAL VOCATIONAL EDUCATION AID.** See AGRICULTURE; EDUCATION.

**FEDERATED MALAY STATES.** A British protectorate composed of four states in the Malay Peninsula, as follows: Perak, 7800 square miles; population, 494,057; capital, Taiping. Selangor, 3156 sq. miles; population, 294,035; capital, Kuala Lumpur. Negri Sembilan, 2550 sq. miles; population, 130,199; capital, Seremban. Pahang, 14,000 sq. miles; population, 118,708; capital, Kuala Lipis. Total Federated Malay States, 27,506 sq. miles; population, 1,036,999; capital, Kuala Lumpur.

A table of commercial statistics follows for 1915.

	Imports	Exports
Perak .....	£3,376,428	£6,883,344
Selangor .....	4,078,214	5,429,044
Negri Sembilan .....	707,983	1,386,755
Pahang .....	445,238	702,519

There is no public debt.

Railway lines in operation (1915), 872. The Railways Administration controls the lines in the Malay Peninsula, including the Johore State Railways, leased since January, 1912. In 1913 the Singapore Railway had 20 miles in length, which had been leased to the Railways Administration from the colonial government from January, 1912, at a rental of \$150,000 and was purchased for \$4,136,000. In 1916, the railways of the Federated Malay States produced a net profit of 4,027,228 dols. (£469,843) as compared with 2,636,397 dols. (£307,579) in 1915 owing to the general prosperity of the country in the year 1916. The total number of passengers carried in 1916 was 14,741,066 as compared with 11,899,028 in 1915. While there was an increase of 28.34 per cent in revenue from all sources, the increased expenditures amounted to 18.30 per cent due to the high cost of stores, coal, equipment, etc. The total capital expenditure to December 30, 1916, was £11,924,732, the capital expenditures during the year 1916 amounted to £373,577 of which £207,638 were spent on lines not open to traffic. The most important work done during the year was the extension of the East Coast Railway in Pahang, and the West Coast Line through Kedah and Perlis to connect the Federated Malay States systems with the Siamese system at the northern frontier. In 1917, this latter section was still further advanced so that a complete overland journey was possible from Bangkok the Siamese capital to Kuala Lumpur the capital of the Federated Malay States. When steelwork is obtained for the unfinished bridges direct traffic will be open between Pahang and Bangkok.

The following comparison indicates the conditions of the Federated Malay States Railways in 1916 and in the year 1913 previous to the war:

	1913	1916
Miles open to traffic.....	771	1,028
Stations .....	174	211
Engines .....	153	195
Passenger coaches .....	298	413
Other coaching vehicles....	65	135
Goods vehicles .....	3,289	3,761
Service vehicles .....		947
Train mileage .....	3,351,045	3,829,274
Passengers carried.....	13,143,659	14,241,066

The high commissioner of the protectorate in 1917 was Sir A. B. Young.

**FEDERATION OF CATHOLIC SOCIETIES,** AMERICAN. See ROMAN CATHOLIC CHURCH.

**FEDERATION OF LABOR,** AMERICAN. See LABOR, AMERICAN FEDERATION OF.

**FEMINISM.** See WOMAN SUFFRAGE; WOMEN IN INDUSTRY.

**FENCING.** The twenty-fourth annual inter-collegiate fencing tournament was won by the United States Naval Academy for the third year in succession. Thomas P. Jeter of the navy captured the individual championship with the foils while James E. Kiernan of the same institution took the sabre title. The national championships of the Amateur Fencers' League of America were held at the Hotel Astor, New York City. Sherman Hall of the New York Athletic Club won the title with the foils and A. S. Lyon of the Fencers' Club took the sabre honors. The three-weapon championship was won by Steddiford Pitt of the New York Athletic Club.

Miss Florence Walton of the New York Fencers' Club captured the women's championship. The national interscholastic title went to D. Ducassi of the New York Military Academy.

Dual college meets resulted as follows: Navy 7, Pennsylvania 2; Navy 9, Yale 4; Navy 9, Columbia 4; Columbia 5, Yale 4; Columbia 5, Pennsylvania 4; Harvard 6, Columbia 3; Harvard 7, Springfield Training School 2; Harvard 8, Pennsylvania 1.

**FERTILIZERS.** War conditions accentuated the fact that an adequate and cheap supply of fertilizers was a basic necessity. The fertilizer situation in 1917 in a large part of the world was an increasing demand and an inadequate supply. The statistics of the world's production, distribution, and consumption of fertilizers, available at the end of 1917 while necessarily very incomplete, indicated clearly a marked falling off during the year in production of mineral phosphates, especially in the United States; an even more marked decline in production of acid phosphate; an increased production and export but a rise in price of nitrate of soda; an increased production of ammonium sulphate, especially in Great Britain and the United States; and an increasing production but still wholly inadequate supply of potash from minor sources.

The situation seemed fully to justify the suggestion which had been made that one of the most pressing problems with regard to the fertilizer industry "is to gradually and normally stimulate domestic sources of supply, not only that a repetition of the present situation will be impossible but also that a more extensive peace time production will be the outgrowth." Important steps had been taken in this direction through government initiative in England, France, and the United States, and perhaps other countries. Early in 1917 the Food Controller of Great Britain appointed a committee to make the necessary arrangements for the increase of supplies of fertilizers in the United Kingdom and for controlling their output and distribution. The shortage and high price of fertilizers and the consequent reduced yield of crops had led the French government during the year to undertake to supply the necessary fertilizers and to make special efforts to encourage the better care and use of manure and waste products having fertilizing value.

During the year the fertilizer business was placed in large measure under governmental control in the United States through the authority given the president by Congress to license the importation, manufacture, storage, and distribution of fertilizers with power to revoke the licenses for cause; through the authority given the U. S. Department of Agriculture to collect data regarding the production, distribution, and consumption of fertilizers, and to purchase nitrate of soda and sell it to farmers at cost; and through legislation empowering the president to construct and operate works for the manufacture of synthetic nitrogen compounds for use in munitions and as fertilizer.

All things considered, the ultimate outlook with regard to fertilizers for the United States was extremely promising. There was an abundant and readily accessible supply of mineral phosphate, and acid phosphate should normally be abundant and cheap, and while the country is still dependent upon outside sources to supply

a large part of its needs for nitrogen and potash, much progress has been made in demonstrating that these needs can be wholly met by domestic production. The supply of lime is abundant and should be cheap.

With fertilizers scarce and high priced it was especially important carefully to conserve and use manure. One-half of the value of the manure produced in the United States was probably lost. A large part of this loss would be prevented by better care of the manure, viz., by more frequently spreading it on the land, or by storing it in compact heaps in water-tight covered receptacles. Good husbandry and good business alike dictate that commercial fertilizers shall supplement and not supplant manure. Wide experience has shown that the exclusive use of fertilizers is not good farm practice, and that fertilizers give the most profitable returns when used to supplement farm manure and other home sources of fertility.

From a study of conditions in England with special reference to war-time needs, Voelcker concluded that a supply of acid phosphate, or basic slag, and ammonium sulphate with liberal use of lime to mobilize potash in the soil was essential, and he advised the fullest possible use of all available manure and waste products having fertilizing value, especially those furnishing any considerable amount of potash.

**POTASH.** For all countries except Germany potash continued to be the weakest link in the fertilizer chain. The great natural deposits of potash salts of North Germany, Galicia, Alsace, and Barcelona and Lereda in Spain were not supplying the world at large in 1917 and no similar deposits had been found elsewhere. There was, however, great activity in developing various minor sources of potash. During the first six months of 1917, according to the U. S. Geological Survey, the production of potash in the United States from such sources was about 14,000 tons of actual potash ( $K_2O$ ), of which natural salts and brines yielded about 7740 tons; distillery slops, wool washings, and other industrial wastes, 2150 tons; kelp, 2140 tons; alunite, cement mill, and blast furnace dust, 1860 tons; and ashes (partially reported) 110 tons.

Activity in the discovery and development of new sources of potash, through private initiative and under government auspices, had been so great that there seemed good ground for expecting the domestic production to reach at least 30,000 tons of actual potash in 1917, or a little over one-tenth of the normal requirement of 250,000 to 300,000 tons. The fact that old stocks of potash had been exhausted and the urgent need of potash for manufacturing purposes had greatly increased, however, still further limited the amount available for use as fertilizer.

Probably one-third of the potash produced in the United States in 1917 was derived from the alkali lakes of Nebraska. A considerable amount was also derived from Searles Lake, Cal. There had been a marked increase during the year in the recovery of potash from distillery slop and other industrial wastes. The amount of potash being recovered from cement mill and blast furnace dust in 1917 was only a small part of the amount recoverable. The U. S. Bureau of Soils stated "that with suitable collecting apparatus the cement mills of the country might produce approximately 70,000 tons of actual potash annually. Slight modifications of operating

practice would increase this total to at least 100,000 tons." Some of this dust contains as high as 10 per cent of potash, partly soluble in water, and has been put on the market for direct use in fertilizers. The recovery of potash from blast furnace dust is being attempted by at least one company.

Several plants were engaged in producing potash from kelp in California. The Bureau of Soils completed a \$100,000 plant for this purpose during the year at Summerland, Cal. A good grade of potassium sulphate was being made by one company from Utah alunite. Roasted alunite had also been put on the market for use as a fertilizer. Various processes for producing available potash from insoluble feldspars, greensand, and other silicates have been proposed, but little or no potash from this source has been actually put on the market. The commercial success of such processes seems to depend upon the profitable utilization of the by-products. The untreated silicates have proven of little or no practical value as fertilizer.

A recent act of Congress (S. 2156) defines in detail the method of governmental control of prospecting for potash on public lands and of patenting or renting such lands for the mining of potash, as well as of the distribution and price of the products. An area of about 2500 acres in Searles Lake, estimated to be capable of yielding 5,000,000 tons of potash, is exempted from permit for prospecting or private ownership. It may, however, be rented or operated by the government itself.

**NITROGEN.** In spite of increased production and export, the price of Chile nitrate of soda rose during the year to an almost prohibitive height (about \$100 per ton) from the standpoint of its use as a fertilizer. The situation was such that Congress at its last session provided \$10,000,000 to be used at the discretion of the president for purchasing nitrate of soda to be sold to farmers at cost for cash. The purchases of nitrate for this as for other governmental purposes are to be made through the War Industries Board; the distribution to farmers is to be made through the Department of Agriculture.

The first plant for the production of synthetic nitrogen for use in the manufacture of munitions and fertilizer, provided for in the congressional appropriation of \$20,000,000, has been located at Sheffield, Ala. The Haber process of producing ammonia and a modification of the Ostwald process of oxidizing ammonia to nitric acid were to be used. This was an important step in the direction of making the United States independent of outside sources of nitrogen compounds as Germany is reported to be at the present time through the domestic production of ammonium sulphate, cyanamid, and synthetic nitric acid.

One-half of the 350,000 tons of combined nitrogen estimated to be annually produced in Germany was probably supplied by ammonium sulphate. The production of ammonium sulphate in the United States increased over 30 per cent during the past year but is still not over 40 per cent of the possible production, which is estimated as 600,000 tons annually. Attempts to convert trade wastes and sewage sludge into available nitrogen fertilizer were meeting with a considerable measure of success. The nitrogen of garbage is made readily available by processing, and experiments with so-called activated sludge indicated that recovery of available ni-

trogen from this source "has at last been brought within the range of a commercially practicable problem."

There was increased activity in the production of nitrate of potash in India because of the great value of this material as a source of both nitrogen and potash. The supply of cotton-seed meal for use as fertilizer was short in 1917 but the production of blood and tankage was up to the average. There was, however, an increased demand for all these products as feed for live stock.

**PHOSPHORIC ACID.** Such statistics as were available indicated that the mining of phosphates was more active in northern Africa than in the United States. Both foreign exports and domestic shipments of American phosphates had declined since the war began. The high cost and uncertain supply of raw phosphate and a shortage of sulphuric acid were assigned as causes of the advance in the price of acid phosphate.

In view of the acid phosphate situation it was of great importance from the farmer's standpoint to know that the composting of fine-ground raw phosphate (600 pounds) with sulphur (200 pounds) and fertile soil (200 pounds) to which had been added a small amount of special inoculated soil, as proposed by the New Jersey Experiment Station, seemed to offer a simple practical means of providing at moderate cost the available phosphoric acid so generally needed to stimulate food crop production. The process was very thoroughly tested by the New Jersey Station but it was being coöperatively tested by a number of experiment stations.

Many attempts were made to utilize untreated rock phosphate as a fertilizer with varying success. The New Jersey Station found that buckwheat assimilated the phosphoric acid of raw rock phosphate almost as readily as that of acid phosphate, and that both buckwheat and soy beans readily utilized the insoluble potash of greensand marl. Hence it was suggested that "it might be quite practicable to use ground rock phosphate and greensand marl for the growing of buckwheat and soy beans, and when these are plowed under, the soil would be enriched in available phosphoric acid, available potash, and the nitrogen accumulated by the soy beans."

**FICTION.** See **ARTICLE LITERATURE, ENGLISH AND AMERICAN**, and articles on French, German, Italian, Spanish, and Scandinavian literatures.

**FIJI ISLANDS.** A group of South Pacific islands; a British crown colony. The principal inhabited islands are Viti Levu (4112 square miles), Vanua Levu (2432), Taviuni (217), Kadavu (124), Koro (58), Gau (45), and Ovalau (43). Total area, including the dependency of Rotumah (14), 7435 square miles. Estimated population, December 31, 1915, 159,321 (89,574 natives). Sugar, copra, and fruit (particularly pineapples) are the chief products and exports. Total imports 1915, £880,308 (1910, £870,120); exports, £1,474,192 (£1,005,818). Export of sugar, £1,065,463 (£669,432); copra, £233,759 (£258,914); fruit £120,741 (£47,301). There is no railway. Suva, the capital, has cable communication with Brisbane and with Canada. Revenue, 1915, £273,635 (£211,952 in 1910); expenditure, £282,831 (£236,661). Public debt, December 31, 1915, £49,215. Governor of Fiji and High Commissioner for the Western Pacific, Sir Ernest Bickham Sweet-Escott.

**FILTRATION.** See **WATER WORKS AND WATER PURIFICATION.**

**FINANCIAL REVIEW.** Additional information relating to the financial and commercial developments of the year will be found under the following topics: **AGRICULTURAL CREDIT; BANKS AND BANKING; FOOD CONTROL; INSURANCE; NATIONAL BANKS; PRICES; TARIFFS; TAXATION; TRUSTS.** See also the article **LABOR** and the references there given, and articles on various countries and States of the United States.

**GENERAL CONDITIONS.** While some new maxima were reached in the various aspects of the business life of the United States during 1917, nevertheless the year was distinctly one of caution and of a tendency to recede from the high levels of 1916. At the opening of the year many businesses were largely dependent upon the continuance of peace, with the result that various efforts then being made to secure a discussion of peace terms had the effect of increasing business caution and raising fears lest a sudden peace should unduly upset the industrial fabric resulting from three years of war in Europe. Diplomatic negotiations rapidly indicated that war with Germany was inevitable so that America's actual entrance into the war caused less disturbance to business than might have been expected in the absence of such ample psychological preparation. Thereafter a dominant feature in the business world was the scarcity of capital and the immense demands of the government to finance the prodigious war expenditures. Uncertainties with reference to the volume of taxation continued until the close of the year and exercised a restraining influence upon business buoyancy. The rapid evolution of the excess profits taxes (see **TAXATION**), with the probability that continuance of the war in 1918 would necessitate still further advances, reduced the business optimism that would otherwise have resulted from the enormous profits which many concerns showed.

**STATISTICS.** The most striking feature of the year was the total value of farm products estimated at \$21,000,000,000, an increase of 57 per cent over the previous maximum of 1916. Nearly one-half of this was credited to crops and the remainder to animals and animal products. The stock of gold money in the United States on December 1 was \$3,040,000,000, an increase of 10 per cent during the year. Money in circulation on the same date equaled \$5,085,000,000, an increase of 18 per cent. Total merchandise imports of the year were slightly less than \$3,000,000,000 and total exports somewhat more than \$6,000,000,000, increases respectively of 24 and 13 per cent over 1916, due, as were in part other new maxima, to higher prices. Gold imports were \$694,000,000 an increase of only 1.5 per cent, while gold exports were \$395,000,000 or more than double the 1916 amount. Building expenditures in 155 cities, according to *Bradstreet's*, were \$706,000,000 for 12 months, a decrease of 29 per cent. Fire losses were \$267,000,000, an increase of 15.6 per cent. The unfilled tonnage of the United States Steel Corporation had declined steadily from a maximum of 11,058,000 tons on November 30, 1916, to 9,833,000 tons on December 30, 1917, and to 8,897,000 tons on November 30. The pig-iron production was almost precisely the same in 1916 or slightly over 38,000,000 tons for the year. Anthracite coal shipments totaled 78,156,000 tons,

an increase of 16 per cent. Iron ore shipments by lake were 62,500,000, a decrease of 3.4 per cent. Gross earnings of railways for the year were \$4,188,000,000, a gain of \$451,000,000, or 12 per cent over 1916. Net earnings were \$1,022,000,000, a decrease of nearly \$92,000,000. Operating expenses were \$2,943,000,000, an increase of \$487,000,000 over 1916. *Bradstreet's* index of commodity prices showed an advance of 105 per cent from August, 1914, to December, 1917; and of 29 per cent from January to December, 1917. The new incorporations of companies each with \$1,000,000 capital or over aggregated \$3,693,000,000, an increase of \$1,024,000,000 over 1916 and of \$2,267,000,000 over 1915. The total for all companies with \$100,000 or more capital was \$4,609,000, an increase of \$1,080,000,000 over 1916 and of \$2,547,000,000 over 1915.

**STOCKS AND BONDS.** The dominant characteristics of stock exchange activities during the year was the almost continuous recession in prices and repeated waves of liquidation. The extraordinary stimulation of American trade during the two years preceding had pushed the market prices to rather high levels toward the close of 1916. Consequently at the very opening of the year there were signs of hesitation and reduced optimism. Many of the maximum prices of the year were those of January 2. The President's address shortly thereafter and the investigation of a reported "leak" of financial information involving government officers both produced distinct slumps in prices. The recall of Ambassador Gerard caused a sharp recovery early in February. War appearing inevitable the prices of certain war stocks including steel, locomotive, and metal concerns moved up rapidly. This movement, however, was abruptly checked by the determination of the government to adopt a policy of price-fixing and to purchase its supplies at substantial reductions from existing market prices. This same backward and forward movement continued to the close of the year, a general downward tendency in the prices of both stocks and bonds being only occasionally checked by favorable war news. The most spectacular single movement of the year was the very sharp advance of railroad stocks in December following the announcement of the government's policy of railroad management. In sympathy with the advance in railroad shares other securities swung upward though less decisively. A depressing effect from August to December was the growing consciousness that war expenditures would involve heavy taxation. So weak was the support of prices and so amazing the continued shrinkage of values that on November 1, the New York stock exchange authorities took action to check short selling. The advisability of closing the exchange or of fixing minimum prices was discussed. It was decided, however, to keep a close daily account of borrowed stocks in order to prevent excessive short selling and deliberate drives against particular stocks. Another factor was the ruling of the Federal tax authorities that in order to secure the advantage of reductions in security values as deduction from income and profits taxes such losses must have been actually experienced. This required investment firms to make many sales especially of bonds, which otherwise they would have avoided. This influence, however, was removed in December by the ruling of Secretary

McAdoo permitting investment firms to register the amount of depreciation of securities as measured in actual market values.

The combined monthly averages for 25 railroad stocks showed a decline in every month of the year except March and December. Their averages for January showed high of 81.22 and low of 77.86. There was, except for March, steady decline to a November high of 60.13 on the first day of the month and a low of 55.71 on the eighth. The low point of the year was 52.06 reached on December 20. The high point for that month was December 28 with an average of 60.67. A somewhat similar movement was made by the industrials except that both March and May recorded advances over the preceding months for 25 industrials. The high point of the year was 99.74 on January 4, and the low was 62.81 on December 20. The recovery in December brought the average to 72.40 on December 31. The average of the 50 stock prices reach a maximum for the year of 89.48 on January 20 but fell to a minimum of 74.24 on December 20. Total transactions for the year were 184,536,000 shares of stock. This was less than the corresponding figure of 1916, but exceeded the corresponding figures for the six years 1910 to 1915 inclusive.

The bond market was not strong even during the first half of the year and after the flotation of the first Liberty Loan was manifestly weak. While there were thus many ups and downs until about August 1, from then until December 20 there was almost continuous and precipitate recession of prices. A very important factor in the cheapening of bonds was the scarcity of fresh capital, the consequent rise in interest rates, and the high prices of commodities in general. The pre-war dollar became worth only 60 cents and persons depending on income from investments sought higher returns than their bonds had previously given. Total bond transactions were \$1,052,347,000, slightly less than the 1916 total, but greater than in any of the preceding six years.

**GOLD MOVEMENTS.** A fundamental indication of the course of international trade is the international movement of gold. Upon the outbreak of the war the fact that the United States was a creditor nation and that all belligerent nations and even some neutrals were extremely desirous of increasing their gold holdings resulted in enormous exports of gold from the United States. With the increasing purchases of both belligerents and neutrals in American markets this movement was reversed in 1915. A steady stream of gold found its way to America throughout 1916 and 1917 with momentous consequences to credit, business, and prices. It was estimated that during 1915 and 1916 the United States imported \$1,036,554,000 of gold. During this period it exported \$174,226,000 leaving a net balance of \$826,328,000 imported. During the first quarter of 1917 the net importations were about \$270,000,000, so that by April, 1917, there had been added to the gold stock of the United States about \$1,130,000,000 since the outbreak of the war. This represented only one phase of the tremendous effort of foreign countries, especially England and France, to pay for their purchases of American goods. During this same period at least \$2,000,000,000 worth of American securities previously held abroad were resold to this country. In addition loans and

credits extended to belligerents and neutrals aggregated more than \$2,500,000,000. Thus up to the close of March, 1917, the net balance of trade in favor of the United States aggregated about \$6,000,000,000.

The enormous expansion of the gold basis resulted in an even greater expansion of American credit facilities. Thus on June 30, 1914, the gold in United States banks amounted to \$913,000,000 upon which rested \$21,351,000,000 of credit in the form of deposits. On June 30, 1916, on \$1,140,000,000 of gold there were based \$28,250,000,000 of deposits. In these two years the ratio of gold to deposits declined from 4.27 to 4.02 per cent according to the computation of the National Bank of Commerce in New York. This expansion of credit facilities made the New York money market easy and greatly stimulated industrial expansion and stock exchange transactions. At the same time, however, in connection with the unusual character of war demands it threatened to bring about abnormally high prices necessitating advances in wages; it was also favorable to a general dislocation of the economic organization which indicated an unusually serious disturbance of business upon the conclusion of peace. It was pointed out by many observers that American high prices would make the country an excellent market to sell in but an unfavorable one to buy in when the war was over. The scanty holdings of gold abroad would result in relatively lower prices which would stimulate foreign producers in making exports to America and check their purchases here. Consequently a reversal in the direction of the gold stream not only was to be expected but would be accompanied by a lowering of prices, a lowering of wages, and extensive economic readjustment. So important, however, were the gold holdings for the existing credit fabric that in September the government forbade its exportation except under special license; nor were banks permitted to segregate or set aside quantities of gold marked for special customers or uses when peace is restored.

All foreign countries were deeply affected by the gold movement. Belligerents sought to retain possession of their gold holdings even allowing exchange rates to become distinctly unfavorable before shipping gold. In all cases also the decline in the gold holdings was accompanied by a considerable enlargement of paper money, such issues, as a rule, greatly exceeding the gold withdrawal. In most neutral countries the effects were similar to those in the United States, that is, gold imports, credit expansion, trade stimulation, and higher prices. Consequently in Scandinavian countries, in Holland, in Spain, and elsewhere steps were taken to discourage the importation of gold. An incidental effect of these actions was the decline in the rate of American exchange so that the American dollar was at a discount abroad. According to the National Bank of Commerce the percentage additions to the gold holdings of leading nations between January 1, 1914, and January 1, 1917, were as follows: Japan, 38 per cent; United States, 49 per cent; South America, 8 per cent; Spain 98 per cent; Switzerland, 83 per cent; Denmark, 50 per cent; Norway, 53 per cent; Sweden, 89 per cent; Holland, 200 per cent. On the other hand, there was a falling off of the indicated percentages in the following countries: Germany, 2 per cent; Italy, 9 per cent; Russia,

12 per cent; France, 14 per cent; Great Britain, 35 per cent; Austria, 49 per cent; and Turkey, 50 per cent.

**NEW INDUSTRIES.** Not the least important effect of the war was the stimulation of new industries in the United States. The extensive variety of these could as yet be only roughly estimated. No doubt the most extensive changes occurred in the general field of chemicals, drugs, and dyes (see *CHEMISTRY, INDUSTRIAL*). Previous to the war the imports of these articles from Germany amounted to many millions of dollars. Whereas coal-tar colors were then being produced in this country in some half dozen establishments producing 3300 tons of coal-tar colors primarily from intermediates from Germany, in 1917 not fewer than 150 firms had entered this industry and the product was sufficient to supply the textile, leather, paper, ink, paint, varnish, feather, fur, wood-working, shoe dressing, and many other industries employing at least 2,000,000 workers with total products valued at several billions of dollars. In addition under the leadership of Thomas A. Edison an extensive supply of carbolic acid, benzol, and aniline was produced. German potash was previously imported to the extent of over \$17,000,000 a year. The war however developed an extensive industry in the extraction of potash from kelp or seaweed on both coasts, especially the Pacific. In addition potash was being produced from feldspar and the vast deposits of Utah alunite, as well as from molasses distilleries, gases of blast furnaces and cement mills, and tobacco stems. In 1916 Congress had appropriated \$20,000,000 for the development of the nitrogen industry for the benefit of the army and navy. It was estimated that in consequence of these industries the annual production of potash at pre-war prices had risen to \$90,000,000 and of nitrogen to \$60,000,000. In the same general field was the development of the manufacture of prussiates; of oxalic acid, of which we previously imported 4000 tons per year; of carbonate, chloride, and dioxide derivatives of barite, previously imported to the amount of 90,000 tons worth \$500,000 per year; Russian petrolatum was improved from American sources. Here also should be mentioned photographic paper and photographic supplies; curved watch faces; improved mouth pieces for cornets and other horns; small musical instruments; laboratory utensils, apparatus, and machinery; optical glasses; ichthylol, a pharmaceutical drug formerly imported from Austria; the widely used aspirin; the celebrated salvarsan; and multitudes of other drugs and chemicals. The authorized capital of firms organized between January 1, 1915, and September 1, 1917, for the manufacture of drugs, chemicals, and dyes was over \$300,000,000; the total investment for the calendar year 1917 was estimated at over \$75,000,000. At least a score of firms had capital of \$1,000,000 or more each. In consequence the exports of chemicals, drugs, and dyes increased from \$27,000,000 in 1914 to approximately \$185,000,000 in 1917. In the three months ending with September America exported \$1,173,000 of dyes to 21 countries previously supplied by Germany. Other industries due primarily to the shutting off of German supplies are the toy industry, the mica industry, and the porcelain industry. A considerable business also has developed in the manufacture of

imitation Turkish rugs; fine gloves and other leather products; while the fur industry has taken on new form and extent.

At Perth Amboy was constructed a large smelter for the refinement of Bolivian tin, previously imported from Europe. In several places the production of bromine was begun. Refined wool's grease of lanolin previously imported in large amounts for salves, ointments, and emulsions and unrefined wool's grease for use in cordage factories and tanneries previously imported to the extent of thousands of tons were produced in this country. The war gave a tremendous impetus to the steel industry and all allied industries. The aeroplane industry grew from rudimentary beginnings to an investment of scores of millions and brought with it a considerable group of small contributory industries. Likewise the munitions industry. During the fiscal year 1917 America exported \$1,240,000,000 of explosives. This industry also gave birth to many contributory industries. The rubber industry expanded apace, while shipbuilding became so important that not less than \$350,000,000 were invested in it from the beginning of the war to the close of 1917.

**FOREIGN EXCHANGES.** Both sterling and Paris exchange remained nearly normal throughout the entire year, this being due to the close financial relations of the United States with these countries and to the especial efforts of English and French governments and bankers to maintain their credits of this country. American advances to the Allies being spent entirely in this country served to maintain the balance of trade. On the other hand, bills on Rome declined, especially following the reverses of the Italian army, while the Russian revolution caused a spectacular drop in the exchange value of the ruble. Thus in January Roman exchange (par, 5.18 lire equal \$1) was 6.86 l. equal to \$1 and in November 8.97 l. equal to \$1. The Russian ruble normally worth 51.2 cents showed a maximum value for the year of 29.95 cents in January and a low record of 11.25 cents in September. On the other hand, exchange with neutral European countries showed new high records especially bills on Amsterdam, Zurich, Copenhagen, and Madrid. Following the declaration of war against Germany on April 6, bills of exchange on Germany and Austria ceased.

**BANK CLEARINGS.** Owing to the remarkably high prices bank clearings showed very high totals. For 151 cities the aggregate clearings for the 12 months were \$304,399,000,000, an increase of 17.2 per cent over the previous maximum attained in 1916. Of the total, \$126,994,000,000 were credited to cities outside New York, which showed an increase of 26.4 per cent over 1916. The clearings for different sections of the country were as follows: New England, \$14,847,000,000; Middle States, \$201,675,000,000; Western States, \$13,066,000,000; Northwestern States, \$33,254,000,000; Southwestern States, \$18,618,000,000; Southern States, \$11,291,000,000; Far Western States, \$11,646,000,000. For the principal cities the totals for the year were as follows in millions of dollars: New York, \$177,404; Chicago, \$24,974; Philadelphia, \$17,197; Boston, \$12,674; St. Louis, \$6967; Pittsburgh, \$4021; Kansas City, \$7622; San Francisco, \$4837; Baltimore, \$2226; Detroit, \$2749; Cincinnati, \$2030; Minneapolis, \$1660; Cleveland, \$3730; Los Angeles, \$1502; New Orleans, \$1963; Omaha,

\$1873; Milwaukee, \$1300; Atlanta, \$1605; Louisville, \$1023; Seattle, \$1151.

Canadian clearings likewise showed considerable increases over those of the preceding year. The aggregate throughout the Dominion was \$12,257,000,000, as compared with \$10,315,000,000 in 1916. The totals for principal cities were as follows in millions of dollars: Montreal, \$4188; Toronto, \$3004; Winnipeg, \$2622.

**BUILDING.** An important index of industrial conditions is the extent of building operations. As indicated above the aggregate for the year in the United States was \$706,810,000, a decline of 29 per cent from the 1916 total. During the first quarter of the year building expenditures totaled \$197,000,000, or nearly the same as in the same quarter of 1916. For the second quarter they were \$225,319,000, a decrease of 26.6 per cent. For the third quarter they were \$164,230,000, a decrease of 38 per cent; and for the fourth quarter they were \$120,231,000, a decrease of 46.8 per cent from the same quarter of 1916. The aggregate for the year was less than in any preceding year since 1908 and the decrease was shown throughout the country.

**FAILURES.** According to *Dun's Review* the total number of failures in 1917 was 13,855, as compared with 16,993 in 1916, 22,156 in 1915, 13,660 in 1914, and 16,037 in 1913. Of the 1917 failures 3691 were in manufacturing, 9430 among traders, and 734 among agents and producers. The failures in some particular lines showing larger numbers were as follows: Lumber, carpenters, and coopers, 517; clothing and millinery, 535; milling and bakers, 305; groceries, meat, and fish, 3129; general stores, 975; hotels and restaurants, 530; liquors and tobacco, 732; clothing and furnishing, 836; chemicals and drugs, 362. The aggregate liabilities of all commercial failures in 1917 were \$182,441,000. This was less than the total in any preceding year since 1906, except 1909. The percentage of business firms failing in different recent years was as follows: 1917, 0.80; 1916, 0.99; 1915, 1.32; 1914, 1.10; 1913, 0.99. Only one year in the last 20 has shown a smaller percentage of failures than 1917, namely, 1906; in 1909 and 1910 the percentage was the same.

Bank suspensions, including other fiduciary corporations, totaled 42, as compared with 50 in 1916 and 133 in 1915. Aggregate liabilities were \$18,452,000, as compared with \$10,396,000 and \$37,223,000 in the two years preceding.

**CANADA.** The total number of commercial failures in Canada was 1097, as compared with 1685 in 1916; 2661 in 1915; 2898 in 1914; and 1719 in 1913. The number was smaller than in any of the last dozen years preceding. Total liabilities were \$18,241,000, an amount greatly exceeded in each of the three years immediately preceding, but exceeding those of preceding years. There were no banking failures in Canada.

**TRADE CONTROL.** An important feature of American trade and commerce, as indeed for much of the rest of the world, was the determination of the Federal government to regulate imports and exports as a means of increasing military efficiency. Numerous studies of trade showed that large quantities of American food and cotton were doubtless reaching Germany by way of neighboring neutrals, especially Holland and the Scandinavian countries (see below). It was evidently necessary, in order to bring the

greatest amount of economic pressure to bear upon the Central Powers, to cut off these important supplies of fundamental necessities. On July 9, the president issued a proclamation prohibiting the export of foods, grains, meats, steel, and other war materials from the United States except as licensed by the government. This proclamation was issued under the authority of the so-called "Espionage Act" passed June 15. This was "an act to punish interference with the foreign relations, neutrality, or foreign commerce of the United States." One section gave the president authority to control exports even to the extent of establishing an embargo. On August 27 an additional proclamation placed all articles of export, especially to the neighboring neutrals of Germany and her allies under the control of the Exports Administration Board. Special control was given over cotton, sugar, and lumber to all countries. Finally on September 7 on account of great withdrawals of gold by Japan, Mexico, Spain, and South America, a complete gold embargo was established. This policy was further extended by the "Trading With the Enemy Act" of October 5 forbidding either direct or indirect trading with the enemies of the United States and extending the executive powers to include the prohibition of imports. By a proclamation of October 15 the president placed the entire control of both exports and imports in the hands of the War Trade Board, the Secretary of the Treasury, and other governmental authorities especially cognizant of movements of particular commodities. One consequence of these extensive regulations was the narrowing of foreign trade and a reduction in its volume. In carrying out these policies close scrutiny was given to the trade of numerous concerns, and a blacklist similar for the most part to the British blacklist was prepared; this included 1600 South American firms.

As indicated the British Government had previous to our entrance into the war taken numerous steps to control movements of goods to the neighbors of Germany. A final stage in this policy was an order of October 2 prohibiting exports of all kinds to Sweden, Norway, Denmark, and Holland, except printed matter and personal baggage. Other steps in this policy by the Allies was the conjoint action of the United States and Canada and Newfoundland requiring licenses for the exportation of all food supplies. The Federal Export Administrative Board on October 4 placed a ban on the exportation of bunker coal, with the approval of all the Allies. This latter order created extensive alarm among European neutrals as it threatened to paralyze Dutch and Scandinavian trade.

**SCANDINAVIAN TRADE.** Calculations of the National City Bank published in December showed that American exports from Norway, Sweden, and Denmark for the three years following August 1, 1914, averaged nearly four times the exports in the immediately preceding years. This latter average was less than \$40,000,000 per year. For the fiscal year 1915 the exports to these three countries totaled \$197,000,000; for 1916, \$169,000,000; and for 1917, \$184,000,000. Whereas Denmark in 1914 purchased only \$15,870,000, in 1915 she purchased \$79,824,000; in 1916, \$65,872,000; and in the fiscal year 1917, \$56,729,000. Similar figures were given for Norway and Sweden. Some of the more striking

changes were the following: In 1914 Denmark purchased only \$95 worth of corn in the United States; in the three years ending June 30, 1917, she purchased about \$9,000,000 worth annually. Her purchases of wheat increased from \$845,000 in 1914 to \$3,000,000 in 1915; and \$2,000,000 in 1916; her copper purchases rose from less than \$100,000 in 1914 to over \$1,000,000 worth in 1915 and 1916; there were similar large increases for cotton, cottonseed oil, iron and steel, leather manufactures, flour, rye, lard, and bacon. There were similar increases for the same items for Norway and Sweden. With the declaration of war and the placing of an embargo on exports to these countries by the president, shipments of these important war goods to the neighbors of Germany were stopped.

**WAR COSTS.** *The Wall Street Journal* computed the total outlay of all nations for the first three full years of war, July, 1914, to August, 1917, at 90 billion dollars. The daily cost had reached \$117,000,000. The daily cost to Great Britain rose to about \$40,000,000 in the winter of 1916-17, but fell off nearly \$5,000,000 by mid-summer. The accompanying table gives a convenient summary in thousands of dollars (000's omitted):

<i>Entente Allies</i>		
<i>Expenditures</i>	<i>Aggregate</i>	<i>Daily in July</i>
United Kingdom .....	\$26,705,000	\$35,000
France .....	16,580,000	18,500
Russia .....	14,250,000	15,000
Italy .....	5,060,000	7,000
United States .....	1,629,000	19,100
Others .....	3,250,000	5,000
Total .....	\$67,414,000	\$99,600
Less advances .....	7,992,500	22,900
Net total .....	\$59,421,500	\$76,700
<i>Teutonic Alliance</i>		
Germany .....	\$19,750,000	\$25,000
Austria-Hungary .....	9,700,000	13,000
Bulgaria and Turkey.....	1,450,000	2,000
Total .....	\$30,900,000	\$40,000
Less advances .....	600,000	....
Net total .....	\$30,300,000	\$40,000
<i>Grand Total</i>		
Entente Allies .....	\$59,421,500	\$76,700
Teutonic Allies .....	30,300,000	40,000
	\$89,721,500	\$116,700

On the basis of the foregoing figures of daily expenditures in July, 1917, the total for all belligerents must have approximated at least 105 billion dollars by the close of 1917.

**AMERICAN WAR FINANCE.** The Federal war finance programme was prodigious. Little exact knowledge existed within the first months after the declaration of war of the total disbursements that would be required. Even as late as November 1 estimates were given to the papers that the requirements for the fiscal year 1917-18 would range from 14 billion dollars to 19 billion dollars. The actual appropriations for war purposes made by the 64th Congress, 2nd session, were \$1,977,210,000. The appropriations made by the 1st session of the 65th Congress were \$16,901,967,000. There were in addition authorized contracts for the fiscal year 1918 calling for \$2,511,954,000. The total of these three items is \$21,390,731,000. Of this 7 billion dollars was to be lent to the Allies at the rate of

\$500,000,000 per month. It was not known even in December how much of these vast appropriations would be actually spent before June, 1918. It did not seem possible in view of the productive capacity of the country for the government to spend the entire appropriation. In December there was much agitation over the delays in production. It was reported that, although the government's programme called for expenditures of one billion dollars in October, only \$450,000,000 of goods could be purchased. To secure funds an extensive system of new taxes was authorized (see TAXATION) and two liberty loans were put out besides short-term Treasury certificates of indebtedness and the war savings stamps as described below. Acts authorizing the issue of loans were passed on April 24 and September 24; the former called for 7 billion dollars of bonds and the latter for \$11,538,945,460 of bonds, certificates, and savings stamps.

**FIRST LIBERTY LOAN.** In the war revenue act of April 24 Congress had authorized the borrowing of \$7,000,000,000, of which 3 billions were to be invested in war bonds of the Allies. On May 14, Secretary of the Treasury McAdoo announced the offering of the first Liberty Loan to consist of \$2,000,000,000 of 30-year  $3\frac{1}{2}$  per cent bonds. These bonds were absolutely exempted from all Federal and State taxes except the Federal inheritance tax. They were made convertible into the bonds of any subsequent issue at a higher rate of interest. In order to secure subscriptions an organization was perfected with the twelve Federal reserve banks as the central agencies in their respective districts. In addition to the twelve district committees great numbers of sub-committees including one in every city and town, with still other subordinate committees for special classes or groups in each community, were brought into operation. Numerous avenues of publicity were utilized. Subscriptions were closed on June 15 and the bonds dated from that day although not issued until late in the year. Total subscriptions from more than 4,000,000 persons were \$3,035,000,000. Since only \$2,000,000,000 had been offered the larger applications were reduced. Each reserve district except those centring at Kansas City, Minneapolis, and Atlanta collected subscriptions in excess of their allotment.

**THE SECOND LIBERTY LOAN.** Subscriptions to the second loan were opened October 1 and closed October 27. The minimum amount authorized was 3 billion dollars with the proviso that one-half of any excess subscriptions would be accepted. The plan called for payment down of 2 per cent, 18 per cent on November 15, 40 per cent on December 15, and 40 per cent on January 15, 1918. The interest rate was 4 per cent, payable semi-annually on November 15 and May 15. The bonds will run for 25 years but are redeemable at the option of the government after 10 years. They are convertible into any subsequent war issue bearing a higher rate of interest within 6 months after such issue is announced. They are exempt from State and local taxation except State inheritance taxes and the "additional" income taxes; such "additional" tax, however, applies only to the interest on holdings of \$5000 or more. It was believed that this issue was by these taxes made more attractive to the small investors. The same thorough organization for every State and locality was

utilized as in the case of the first liberty loan. There were also numerous advertisements by bill boards, street cars, newspapers, magazines, and circulars; numerous corporations and banking and other institutions generally urged their employees or constituencies to subscribe. Much interest and enthusiasm was also aroused by hundreds of volunteer canvassers and speakers.

The total subscriptions from 9,500,000 persons were \$4,617,532,300, so that the actual issue was \$3,808,766,150. In every Federal Reserve District the minimum allotment was oversubscribed, the percentage of over-subscription ranging from somewhat less than 4 per cent for Dallas to 62 per cent for Cleveland, 68 per cent for Richmond, and 72 per cent for New York; the average over-subscription was 54 per cent. In determining the allotments it was decided to fill all subscriptions up to and including \$50,000 at the full amount; but to allow only 90 per cent of subscriptions between \$50,000 and \$100,000, but no allowance in this group to be less than \$50,000; 75 per cent of subscriptions between \$100,000 and \$200,000, but no allotment less than \$90,000; 60 per cent of subscriptions between \$200,000 and \$1,000,000, but none less than \$150,000; 50 per cent of subscriptions between \$1,000,000 and \$8,000,000, but no allotment less than \$600,000; 41.2 per cent of subscriptions between \$8,000,000 and \$30,000,000, but not less than \$4,000,000; and 40.8152 per cent of a subscription for \$50,000,000. Treasury certificates which were outstanding to the amount of \$2,320,493,000, due at different dates in November and December, were applicable to purchase of these bonds. In the stock market the  $3\frac{1}{2}$  per cent liberty bonds had fluctuated about par with a usually slight discount before the issue of the second series. Thereafter the  $3\frac{1}{2}$ s fluctuated about 98-99 and the 4s about 97-98.

**WAR SAVINGS STAMPS.** For the purpose of raising funds and cultivating thrift Congress authorized the sale of war saving stamps in two denominations, 25 cents (thrift stamps) and 5 dollars (war savings stamps). A Thrift Card was furnished having space for 16 stamps; when filled this could be exchanged for a \$5 stamp by the payment of 12 cents in December, 1917, or January, 1918; thereafter the cost for 16 stamps advanced one cent per month. These large stamps could be attached to a War Savings Certificate which had spaces for 20 stamps. If this was filled out between December 1, 1917, and January 31, 1918, at a cost of \$82.40 the government would redeem the certificate on January 1, 1923, for \$100; similarly for later dates. All stamps and certificates mature in five years from date of issue. The difference between \$4.12 and \$5.00 is the interest on the former sum for five years at 4 per cent compounded quarterly. No one person could hold more than \$1000 worth of these certificates, nor purchase more than \$100 worth at one time. The stamps were made redeemable at the post office at any time at a lessened rate of interest. To carry out the plan there were appointed six Federal directors giving their entire time to the work, each being in charge of two Federal reserve bank districts. There was a director for each State and further organization reaching to cities, counties, and towns. The national committee was: Frank A. Vanderlip, who resigned the presidency of the National City Bank of New York to serve

without pay as chairman of this committee; Mrs. George Bass, Chicago; Henry Ford, Detroit; F. A. Delano, Washington; Eugene Meyer, Jr., New York; and Chas. L. Bayne, Boston.

**TREASURY CERTIFICATES.** In order to raise immediate cash largely for the purpose of carrying out the proposed loans to the Allies, the Treasury issued at sixteen different times the varying amounts of temporary certificates of indebtedness. Their total amount was \$4,028,698,000; only \$690,000,000 issued November 21, bearing 4 per cent interest and due June 25, 1918, were still outstanding at the close of the year. Two small issues on March 31 and October 29 bore 2 per cent interest; 2 issues on April 25 and May 10 bore 3 per cent; 2 on May 25 and June 8 bore  $3\frac{1}{4}$  per cent; 3 issues on August 9, August 28, and September 17 bore  $3\frac{1}{2}$  per cent; and 7 other issues, all after September 26, bore 4 per cent. Nearly \$2,500,000,000 of these certificates were placed through the Federal reserve banks at New York.

**ADVANCE TO ALLIES.** The plan of the government included advances to the Allies of \$500,000,000 per month. The first advance was of \$200,000,000 to Great Britain on April 25. By the close of the year the total advances had reached the sum of \$4,236,400,000, distributed as follows: Great Britain, \$2,045,000,000; France, \$1,285,000,000; Italy, \$500,000,000; Russia, \$325,000,000, of which \$5,000,000 was for the Rumanian government; Belgium, \$77,400,000; and Serbia, \$4,000,000. These advances were made on the basis of the obligations of foreign governments purchased by the Treasury. Loans were at first made at the rate of 3 per cent per annum, but soon advanced to  $3\frac{1}{4}$  per cent in order to conform to the rates paid by the Treasury on its own certificates of indebtedness (see above paragraph). Following the flotation of the first Liberty Loan the rate on foreign loans was advanced to  $3\frac{1}{2}$  per cent; and finally following the issue of the second Liberty Loan the rate was raised to  $4\frac{1}{4}$  per cent.

Preceding our entrance into the war it had been the practice of foreign governments to issue loans in this country; subsequently to our entrance in order to avoid the competition of foreign governments with our own, the policy of making loans to the Allies by the government itself, as indicated in the foregoing paragraph, was adopted. It was estimated that previous to the American declaration of war about \$2,500,000,000 of foreign war loans had been floated in this country. The only variation from the new rule was the issue by the British Treasury through the firm of J. P. Morgan and Company of 90-day discount bills. It was planned to issue about \$15,000,000 of bills weekly up to a total of not over \$150,000,000. In fact the total issued was only \$100,000,000; this amount, bearing 6 per cent interest, was outstanding at the close of the year. In addition the same firm acting for the British and French governments sold some of the collateral upon which previous loans had been based and repurchased part of such loans themselves.

**CANADA.** War financing occupied much of public attention in Canada during the year. On February 8 Premier Borden in his budget speech stated that the cost of the war had exceeded all expectations. For the year 1917-18 the estimated military and naval expenditures were put at \$433,000,000, compared with \$217,000,000

for the preceding year; \$166,000,000 for 1915-16, and only \$61,000,000 for 1914-15. The loans of the year included the third war loan of \$150,000,000 in 5 per cent bonds at 96 issued in March. A loan of \$100,000,000 was floated in the United States in July through the firm of J. P. Morgan and Company. This was the only foreign loan floated in the United States after its entrance into the war, and special permission for it was given by Secretary of the Treasury McAdoo. Finally in November the victory loan was put out, 807,361 subscribers asking for \$417,000,000. The loan amounted to \$400,000,000 in the form of  $5\frac{1}{2}$  per cent gold bonds in three series maturing in 1922, 1927, and 1937. The flotation of this immense loan in Canada was an evidence of sound financial conditions; in 1916 two-thirds of the Canadian loans, Dominion and Provincial, had been floated in the United States, whereas in 1917 only slightly more than one-fifth were sold here. In connection with war financing, Canada began early in the year to issue savings stamps and certificates on a plan similar to that adopted previously in Great Britain and later in the United States.

In trade and manufacturing new high points were reached. Exports for 11 months totaled \$1,399,000,000, as compared with \$961,666,000 and \$521,953,000 for similar periods of 1916 and 1915. Imports for this period were \$943,500,000, as compared with \$698,709,000 and \$405,973,000 for the like periods of 1916 and 1915. There was thus a favorable balance of trade of nearly twice that of 1916 and fully three times that of 1915. Crops were fairly abundant and prices high. Shipbuilding rapidly advanced on both coasts. Mineral production was hampered by labor shortage and unrest but the total value of output was \$200,000,000, as against \$190,646,000 in 1916. Building expenditures declined from \$96,000,000 in 1914, and \$39,000,000 in 1916, to \$35,000,000 in 1917. Various new industries, notably potash, toy-making, and dye manufacture, developed rapidly. The prosperity of the country was attested by the increase in individual deposits in banks from \$663,650,000 June 30, 1914, to \$1,008,000,000 November 30, 1917. War orders aggregating about \$1,812,000,000 were placed in Canada from July, 1914, to December, 1917, of which slightly over \$1,000,000,000 were placed by the Imperial Munitions Board. For bank clearings and failures see above paragraphs.

**GREAT BRITAIN.** The great financial and commercial strength of Great Britain showed to superior effect amidst the tremendous obstacles of the third year of war. Aggregate war expenditures reached £4,200,000,000 in February. In September the war cost above the normal peace budgets was estimated at five billion pounds sterling (\$25,000,000,000) and yet not the slightest feeling of uncertainty had been manifest as to the soundness of the financial structure. This estimate, made by the Select Committee on National Expenditure, showed that advances to Allies had amounted to £1,321,000,000 to September 30. The dead-weight national debt had thus been increased by about £3,500,000,000 and the annual debt charge by over £200,000,000 or a billion dollars. It was estimated that each six months of war would add £750,000,000, exclusive of advances to Allies, to the debt and £45,000,000 to the annual debt charge (interest at 5 per cent and sinking fund

1 per cent). The total war credits for the fiscal year April, 1917, to March, 1918, inclusive, were £2,450,000,000. There were great quantities of Treasury bills outstanding at all times, their volume in December being £1,059,000,000. As elsewhere prices advanced sharply. The London *Economist* estimated the index level of general prices as follows: Average for 1901-5, 2200; September 30, 1916, 4423; September 30, 1917, 5634. As indicated above British purchases in the United States necessitated large loans from the United States government to maintain trade balances. In addition, for the same purpose, British owners of American securities were estimated to have sold \$1,750,000,000 of them back to American investors since the war started. The high rates of interest caused British Consols to drop in January to 51½, their lowest since 1803, while securities in general continued to shrink in market values. The London *Bankers' Magazine* reported that declines in the market values of 387 representative stocks amounted to nearly £158,000,000 for the year and to £771,000,000 since July, 1914. The high level of trade is indicated by total exports for the eleven months ending November 30 of £488,168,000, an increase of 4.6 per cent over the same period of 1916 and 26 per cent above those of 1915. Imports for eleven months were £980,500,000, or 12.2 per cent over the same period of 1916, and greatly exceeding any previous year. Re-exports, however, were only £66,372,000 for 11 months, a decline of 27.6 per cent and much less than any recent year. See BANKS AND BANKING; LABOR; STRIKES AND LOCKOUTS.

GERMANY. Financial conditions within the Central Powers were largely shrouded in mystery. There were, however, many indications of financial stress, food and clothing shortage, and industrial unrest. The war finances were a prodigious burden. The fifth war loan was reported in April to have produced 12,770,000,000 marks (\$3,192,000,000). In February the Reichstag authorized a sixth credit of 15 billion marks and in July a seventh of like amount. The sixth loan was reported to have produced \$3,089,000,000, and the seventh \$3,156,000,000. This last called out 5,213,000 subscribers, of whom 3,233,000 made subscriptions of \$50 or less, and 1,280,000 others subscribed less than \$250 each. The total number of subscribers was less than for the fourth and fifth loans and greater reliance was placed on the large banks. The rapid growth of the public interest charge, the almost complete absence of foreign trade, and the concentration of industrial efforts within the narrowest range of military necessities made increasingly difficult the preservation of a sound financial structure. In addition, in July Germany assumed responsibility for war expenditures of Bulgaria and Turkey. Numerous reports indicated increasing food scarcity and the efforts of the authorities to supply fertilizers and seeds and stimulate production. Nevertheless Mr. Hoover reported to President Wilson in May that the Germans could not be starved into surrender. The scarcity of gold and silver gave great concern because of the unfavorable trade balances with neighboring neutrals. The Reichsbank repeated its appeals for gold in any form and the government threatened to demonetize silver if it were not brought out of hiding. Loans were secured from Switzerland and Holland largely, according to report, by threats to cut off their

coal supply. The scarcity of clothing necessitated government control and the issue of clothing cards.

Plans for the rehabilitation of the merchant fleet and the recovery of foreign trade made much progress. It was reported that a merchant fleet was under construction; that the government would make generous allowances for vessels lost during the war and heavily subsidized shipping after the war; and that similar steps would be taken with reference to various branches of trade, especially toy-making and dye-manufacture. It was planned also to utilize monopolies of buying under government direction to secure raw materials. See BANKS AND BANKING; FOOD CONTROL; STRIKES AND LOCKOUTS.

JAPAN. Japan was never so prosperous as in 1917. Although nominally a belligerent her trade and manufacturing positions were those of a neutral. She nearly monopolized Oriental trans-Pacific trade and built up a thriving commerce with much of the rest of the world. She sent trade commissions to all important countries, opened new steamship lines to China, Russia, Australia, Africa, North and South America, Europe, India, and the South Sea Islands. Her shipyards were worked at full capacity. Her combined imports and exports showed a value double that of 1914. As compared with 1916 there was an increase of over 50 per cent in exports and of about 20 per cent in imports. There were great advances in commodity prices resulting among other things in numerous industrial disturbances (see STRIKES AND LOCKOUTS). Some indication of industrial development is given by Japan's importation of cotton from the United States to the amount of 514,000 bales in the fiscal year 1917, as compared with 484,000 bales in 1916 and 337,000 in 1914. Her total exports for fiscal years were: 1917, \$130,472,000; 1916, \$74,470,000; 1915, \$41,517,000.

FINLAND. A grand duchy on the gulfs of Finland and Bothnia, which was conquered by Russia from Sweden, and finally annexed in 1808. Capital, Helsingfors. Consequent upon Russia's revolution and subsequent disruptions, the Finnish papers state that on Friday, November 9, 1917, the Finnish Diet decided, by 106 votes to 90, to inaugurate a régime of complete independence by declaring that as the Provisional Russian government no longer existed the Diet entrusted the government of Finland to a directory of three persons—namely, the magistrate Svinhufvud, privy councillor Gripenberg, and the banker Paasikive. The post of governor-general was declared abolished. At the close of the year it was officially reported from Berlin that after the Russian government announced its willingness to recognize the independence of Finland, the German Emperor charged the imperial chancellor to express in the name of the German government recognition of the Finnish republic to plenipotentiaries of Finland then in Berlin. Chancellor von Hertling received the plenipotentiaries and informed them Germany had recognized Finland. See RUSSIA.

AREA AND POPULATION. The total area is 373,604 sq. kilometres (144,249 sq. miles), of which 47,829 sq. kms. internal waters. Censused population, 3,115,197; estimated 1914, 3,269,401. The population was 33 per square kilometre in Nyland (greatest density), and 2 in Uleaborg (the least), and the average density for the country was 9. Evangelicals numbered

3,057,627, Greek Orthodox 52,004, Baptists 4467, Methodists 676, Roman Catholics 423. Speaking Finnish as their native tongue were 2,565,742, Swedish 344,364, Russian 7339, German 1794, Lapp 1660, other tongues 298. Helsingfors had 170,452 inhabitants in 1914, Abo 53,926, Viborg 29,329, Tammerfors 45,213, Nikolaistad 24,430, Björneborg 17,571, Uleaborg 21,605, Kuopio 17,587.

Emigration 1915, 4041; 1914, 6474; 1913, 20,057. Marriages 1914, 18,381; births, 87,577; deaths, 50,680.

**PRODUCTION AND COMMERCE.** Cereal crops are grown; also roots and forage plants. The leading crops are rye, barley, oats, potatoes. Saw mills and paper manufacture provide the chief industry, and the forests are a great source of wealth, immense quantities of timber being prepared for export; dairy produce is also exported. Iron ore is mined, and pig and bar iron are produced for export. In 1914 the harvest yielded 69,211 hectolitres of wheat, 3,978,946 of rye, 1,521,039 of barley, 6,897,155 of oats, 6,602,533 of potatoes. Revenue from crown forests in 1914, 15,214,272 marks; expenditure, 3,033,313. The principal articles of export are timber, paper and pulp, butter, hides and leather, wooden wares, fish, cotton textiles, iron. The trade by countries of origin and destination, with values in thousands of marks (gold), is shown below for two years:

	Imports		Exports	
	1914	1915	1914	1915
Germany ..	118,378	6,944	20,987	.....

\* And Norway.

Vessels entered (1914), 8399, of 2,352,282 tons; cleared, 8538, of 2,362,217. Merchant marine (January 1, 1915), 3821 vessels, of 459,306 tons (564 steamers, of 79,172).

**COMMUNICATIONS.** Railways in operation in 1914, 2506 miles. All but 207 miles of line owned by private capital, but operated by the state lines, are state-owned. Finland has 2765 miles of navigable waterways, of which, with the existing facilities, it is estimated that the freight capacity is about 1,600,000 tons a year. The waterways, as well as the railways, are under the administration of the state.

**FINANCE, ETC.** The revenue for the year 1915 amounted to 194,207,122 marks ordinary and 2,121,505 extraordinary (3,568,040 from funds); of which 97,176,273 marks was derived from state domains and forests, railways, canals, etc.; 46,295,710 from indirect taxes (customs and excise), 6,808,317 from direct taxes, etc. Expenditure, 161,365,101 marks ordinary and 37,532,550 extraordinary (597,160 for funds); of which 60,497,942 for communications, 18,555,035 for worship and instruction, 14,976,823 for civil administration, 16,164,999 military contribution, 8,029,563 debt charge, 7,147,450 for agriculture, etc., 6,804,113 for commerce and industry, etc. The debt stood January 1, 1916, at 169,368,117 marks.

According to Stockholm telegrams Finland at the close of the year was completely under control of the Socialists, whose representatives were everywhere taking over the central and communal administrations. At the end of the year at Tornea, assisted by Russian soldiers, they commandeered the wheat in possession of the peasants in the district. No disorders were reported. In order to put an end to the disastrous general strike an endeavor was made to arrive at a compromise between the Revolutionary Socialists and the bourgeois parties. For the relations of Finland to the Russian revolution, see *RUSSIA, History*.

**FIRE INSURANCE.** See *INSURANCE*.

**FIRE PROTECTION.** In the year 1917, and especially with the entrance of the United States into the great war, the subject of fire protection loomed larger than ever previously. In Europe there was every effort made by airmen of the hostile armies to attack cities, munition factories, supply depots, and routes of transportation with explosive and incendiary bombs, and correspondingly equal care was manifested in providing suitable defenses. Both in Great Britain and in Germany considerable damage was done, and extensive plants were destroyed by fire, although official statistics as to the extent and nature of these conflagrations naturally were not available, and but little definite knowledge was gained as to their extent and origin. Enough, however, was made public to indicate that fire was an active factor in the waging of war, and that with the increase in the aeroplane equipment, it would figure still larger.

In the United States, the movement for fire prevention and protection continued with increased attention to the conservation of collected food and other supplies. The financial stringency in many cases prevented the increased fire protection by the large cities which might have been expected under normal circumstances and not infrequently the city fire departments were weakened by the draft and enlistment of firemen in the military and naval services of the United States. There were few radical improvements in fire protection apparatus or equipment during the year, and it was believed that adequacy and efficiency were more to be desired than innovations.

**AMERICA'S FIRE LOSSES IN 1917.** The total fire loss in the United States and Canada during 1917 as recorded in the *Journal of Commerce and Commercial Bulletin* (New York), aggregated \$267,273,300, an amount which with the single exception of 1906, the year of the great San Francisco conflagration, was the largest on record, being \$36,000,000 in excess of 1916 and over \$84,000,000 larger than in 1915.

In 1917, there were 3150 fires which in each instance caused an estimated property destruction of \$10,000 or over, as compared with 2857 such fires in 1916 and 3152 in 1915. Classified on the basis of property damage these fires might be grouped as follows: \$10,000 to \$20,000 loss, 1031; \$20,000 to \$30,000 loss, 581; \$30,000 to \$50,000, 427; \$50,000 to \$75,000, 356; \$75,000 to \$100,000, 164; \$100,000 to \$200,000, 340; \$200,000 and over, 251.

During the year, 1917, there were 61 fires which resulted in an estimated property damage of \$500,000 or over. These were as follows, again quoting the authoritative records of the *Journal of Commerce*:

Location—Description	Estimated damage	1914.....	1894.....
Kingsland, N. J., munition factory.....	\$12,000,000	235,591,350	128,246,400

Erie, Pa., grain elevator.....	500,000	Total for forty years..... \$6,480,267,560	
Chicago, Ill., grain elevator.....	700,000	It was inevitable during 1917 that there should have been a number of serious and costly fires as a result of the world war. In some cases these were due to accidents and in others arson or hostile intent was plainly evident if not always proved. This was especially true in the munitions plant fires which included those at the Canadian Car and Foundry Company's plant at Kingsland, N. J., involving a loss of \$12,000,000; that at the Haskell, N. J., plant of the Du Pont Powder Company causing \$1,500,000 loss; that at the munition plant of the Union Switch and Signal Company at Pittsburgh with a loss of \$4,200,000; and the fire at the Washburn Wire Works at New York City with a loss of \$1,100,000. Naturally the greatest catastrophe of the year was the Halifax explosion and conflagration treated elsewhere in this YEAR BOOK. See HALIFAX DISASTER.	
Sjoux Falls, S. D., grain warehouse.....	1,000,000		
Macon, Mo., railroad station and others..	550,000	The National Board of Fire Underwriters prepared a table showing that in the nine months of 1917 that the United States was engaged in war, the number of known incendiary fires or those of suspicious origin, totaled more than 50,000. In 11 instances, the damage done equaled or exceeded \$1,000,000, the most disastrous conflagration being that of October at the Baltimore piers already referred to. The amount of grain destroyed presumably by incendiaries totaled over \$6,000,000; that of piers and other marine properties over \$5,000,000; oil and oil products over \$6,000,000; and the loss of timber lands and lumber yards also was over \$6,000,000. Unquestionably much of this was done in the interest of the enemy.	
Lexington, Ky., several business houses..	600,000		
Atlanta, Ga., dwelling section of city....	5,000,000	WAR EFFORTS. The importance of fire protection as a war measure was early realized by the National Board of Fire Underwriters, and their efforts were approved by the national government, which lent special aid in the development of their plans to reduce fire waste. Increased efforts were made to safeguard the national food supply by additional protection for warehouses and grain elevators, and this was in part successful, but at the same time there were too many fires in establishments of this nature, as well as among the heavy oil tanks in the southwestern field. In many places local advisory committees were organized and in some cities the insurance inspectors were made fire marshals, while bureaus of fire prevention were organized under city councils of defense or other official bodies. Many of the board engineers were detailed to one department or other of the national government because of their knowledge of construction or other work, and general attention was aroused as to the importance of protecting adequately	
Fort William, Ont., stove works.....	500,000		
Bowie, La., lumber yards and dwellings..	1,000,000	The aggregate fire waste of the United States and Canada in the 40 years from 1878 to 1917 inclusive, reached the extraordinary total of \$6,480,267,560, showing an annual average property loss of \$162,066,689. The accompanying table shows this loss by years, and indicates the general tendency towards increase. This is partly explained by the increased value of the property destroyed, particularly in 1917, but at the same time insurance officials estimated that fully 65 per cent of the loss was preventable.

The aggregate fire waste of the United States and Canada in the 40 years from 1878 to 1917 inclusive, reached the extraordinary total of \$6,480,267,560, showing an annual average property loss of \$162,066,689. The accompanying table shows this loss by years, and indicates the general tendency towards increase. This is partly explained by the increased value of the property destroyed, particularly in 1917, but at the same time insurance officials estimated that fully 65 per cent of the loss was preventable.

FIRE LOSSES DURING FORTY YEARS, 1878-1917			
1917.....	\$267,273,140	1897.....	\$110,319,650
1916.....	231,442,995	1896.....	115,655,500
1915.....	182,836,200	1895.....	129,835,700

the existing food supply as well as making efforts for its increase.

**NEED OF WATCHMEN.** One important development of the year to which the National Board of Fire Underwriters called attention was the necessity of employing proper watchmen around various industrial plants and terminals. The National Board of Fire Underwriters during the year made a series of tests and found that representatives could enter in many cases almost at will, make drawings, and otherwise inspect the property without detection. In the Baltimore fire of October 30, a pier 900 feet long was in charge of but a single watchman in whose hands the safety of vast amounts of military supplies was intrusted. The fire underwriters demanded that watchmen should be picked men of high character and paid adequate salaries and not derelicts hired at random. They should be courageous and physically active, intelligent, and sufficient in number to furnish real protection. They should be armed, and trained in the knowledge of fire alarms, fire prevention, and fire protection.

**SAFE OCCUPANCY.** The report of the Committee on Safety to Life of the National Fire Protection Association, submitted during the year, suggested that the safe occupancy of a building should be based on the capacity of the stairways, as a maximum emptying time of a building is the most essential factor. In the better class of buildings, the number of persons allowed per floor should be in excess of the capacity of the stairs, and the stair enclosures, but in the poorer class of construction or where highly combustible occupancies, only so many persons should be allowed on each floor as could safely escape by the stairs. The report was accepted tentatively and was allowed to go over for the following year for final adoption.

**FIRE RESISTANCE.** A joint committee of the fire protection associations, insurance, engineering, and construction interests prepared a joint report which was presented before the annual meeting of the National Fire Protection Association in Washington, May 8-10, 1917. Mr. Ira H. Woolson of the National Board of Fire Underwriters, an authority on subjects of construction and fire resistance, was chairman of the committee. The various conferences reached an agreement that fire resistance, materials, and construction should be classified in groups based on the degree of protection which they would afford when measured by a fire test. The terms "four-hour protection," "two-hour protection," and "one-hour protection," and so forth were adopted. This report was to receive careful criticism from the various interests involved and would doubtless form the basis of adequate standards to be established for the United States and Canada.

**DEFINITIONS AND TERMS.** The National Fire Protection Association at the annual meeting in 1917, presented a series of accurate definitions of terms used in fire protection, and recommended that the familiar term "fireproof" be discontinued on account of its erroneous application. In its place, the Committee on Nomenclature recommended the terms "fire-resistive," "incombustible," and "noninflammable," and presented formal and adequate definitions for these terms.

**TOLEDO HIGH PRESSURE SYSTEM.** The new high-pressure fire protection system for Toledo,

Ohio, was put into operation on January 18, 1917. It affords protection to 140 acres of the business district from a special pumping station located on the Maumee River close to the Maumee Bridge. This station contained four electric motor driven fire-stage Allis-Chalmers centrifugal pumps with space for two additional units. Each pump had a capacity of 2000 gallons per minute against a pressure of 300 pounds at about 1500 revolutions per minute. The motors were operated at 550 horsepower each and were operated by current bought by the city. The water was derived from the Maumee River, and the distribution system included 22,500 feet of 10, 12, and 16 inch extra-heavy cast-iron pipe. There were 67 post hydrants each with four independent 3½ inch outlets, with double caps reducing to 2½ inches. The total cost of the station was \$190,924.

**BOSTON HIGH PRESSURE SYSTEM.** Towards the end of the year the National Board of Fire Underwriters issued a report criticizing the city of Boston for its delay in completing and developing the high pressure fire service system. The National Board of Fire Underwriters' Engineer said in his report: "The distribution system is only about half complete; many lines necessary to reliability and adequacy, as originally planned, have not been installed, and the number of hydrants is insufficient; conditions have been slightly improved in these respects by laying a 16-inch main on Bromfield Street and a 20-inch one in South Market, and the two lines to the distribution system from the pumping station have been laid in part."

The report also stated: "It is very generally recognized that the city is in sore need of the additional protection afforded by an adequate and thoroughly reliable high pressure fire system. With a seriously undermanned fire department, due principally to a large number of unfilled vacancies occasioned by the national army draft, and with no provisions made for offsetting a still greater depletion of the fire-fighting force by the granting of increased time off after February 1, 1918, the urgency of an adequate high pressure fire system becomes more strikingly apparent. As it is obviously impossible with the present high prices to provide for the construction of the pumping station building and complete equipment with the small balance of funds available, it is recommended that an additional bond issue be authorized sufficient to provide for the following:

"1. The immediate construction of the station of a capacity of 18,000 gallons per minute, capable of being extended to 24,000 gallons per minute.

"2. The completion of the distribution as a duplex system, and the making of systematic tests by maintaining 300 pounds pressure for 24 hours at least monthly."

**ATLANTA CONFLAGRATION.** On May 21, 1917, the city of Atlanta, Ga., experienced a disastrous conflagration, with an estimated total property loss of about \$5,500,000, of which \$3,500,000 was covered by insurance. About 10,000 people were made homeless and a large number of these were of the poorer classes, whose temporary sustenance involved considerable expense to the city. The street railway system by damage to the trolley wires, feeders, and poles suffered to an amount of approximately \$125,000, and the local telephone service incurred a loss

of about the same amount. The fire devastated an area of about 300 acres, involving 1938 buildings, of which 47 were brick and 1891 frame. Of these 1573 were dwellings and apartments, 42 mercantile, 351 garages and outhouses, and 8 of miscellaneous occupancies, including churches, schools, special houses, and warehouses. Of the total number of buildings some 80 per cent, or 1682, had shingle roofs.

This fire started in a small frame building at a time when three other fires were raging in three other parts of the city, consequently, the attention of the fire department was somewhat delayed. Embers of the original fire fell on near-by dry roofs, and served to spread the flames, before an organized effort could be made by the firemen to combat the fire. The result was a series of conflagrations quickly developing which extended over a wide area from a quarter to a half mile ahead of the fire department.

This conflagration was in large measure due to the general use of wooden shingled roofs which not only permitted the fire to extend rapidly in the immediate vicinity of the original outbreak, but also made possible the starting of fires by falling embers, blocks away from the original source and from the fire apparatus. Under such conditions it was found practically impossible for any fire department to give adequate protection to a city so built, and the Committee on Fire Prevention of the National Board of Fire Underwriters was able to find few points of criticism that would compare with the main hazard of structure in importance. It referred to the fact that motor apparatus instead of horse equipment was needed under such conditions because of its superiority of covering long distance runs, and it also referred to the value of high pressure of the distribution system, making possible the extensive use of hose lines direct from hydrants. At this fire there was no shortage of pump or boiler equipment, but the entire capacity of the city was in use and had any of the units been out of service or failed during the fire the conditions would have been very serious so that ample reserve in both pump and boiler equipment for such a contingency are recommended.

An interesting point in the report had to do with the dynamiting of buildings in order to stop fire. It says: "The value of dynamiting buildings to prevent spread of fire in this case is questionable. It is not apparent from the ruins that any good resulted from such work done on or near Ponce de Leon Avenue. With

the wide street intervening and the narrow face of the fire, the department, together with the military forces, which were doing excellent work at this time, stopped the spread from direct exposure, and the wider spacing of the buildings and the newer roofs were very favorable to the work of preventing spread of flying embers and brands. The fire department is of the opinion that the dynamiting on Hunt Street was of some value, as it allowed buildings to be wet down with direct hose lines which otherwise would have been of insufficient reach."

**BALTIMORE PIER FIRE.** One of the most serious fires of the year, believed to be of incendiary origin, occurred on the evening of October 29 at piers 8 and 9 of the terminals of the Baltimore and Ohio Railroad at Locust Point, Md. The destruction of these piers together with freight and other property involving a total loss of some \$4,000,000 was a serious blow to export trade from the port of Baltimore. but its effects were only temporary, as extra facilities were soon extemporized, and new pier 6 was being completed at the time of the fire. In connection with the loss of the pier, the British steamer *Kerry Range* was destroyed. It was reported that the fire broke out in several parts simultaneously and that six other explosions were noted.

**MUNITIONS WORKS FIRE AT LONDON.** In Great Britain one of the serious fires of the year occurred on January 19, at a factory in the east of London near the Thames where the refining of explosives was carried on. The explosive works were completely destroyed and neighboring warehouses, factories, and flour mills were set on fire, as well as three rows of small dwellings in the immediate neighborhood. Sixty-nine persons lost their lives, and 400 persons were estimated as injured.

**BRITISH FIRE LOSSES IN 1917.** The principal fires in the United Kingdom during the year 1917, according to the *London Times*, involved a loss of £4,066,900, as compared with £3,300,400 in 1916 and £4,205,000 in 1915. This estimate was considered very conservative as it involved only fires where the damage amounted to £1000 or more, and did not always include fires which on account of war conditions may not have been reported. The above figures are of interest in comparison with statistics for the United States, although, of course, the area and the population involved were far less.

**STATISTICS OF FIRES.** The Committee on Statistics and Origin of Fires of the National

Board of Fire Underwriters on May 24, 1917, published its usual tables for the leading American and European cities, from which the accompanying material has been compiled. With the great war raging in Europe, it is unnecessary to state that the summary in this field necessarily is incomplete, and that no record has been made of fire destruction due to military activity.

In 1916, twenty-three cities in the United States had a per capita loss in excess of \$5.00, Jersey City, N. J., heading the list with \$27.71. That local conditions are in part responsible for high losses is shown by the fact that in four cities of the United States, the loss in excess of \$5.00 per capita had occurred in three of the five years ended by 1916, and in five other cities, the loss in excess of this amount had taken place in two of the five years.

## COMPARATIVE FIRE LOSSES, UNITED STATES

	Population	Total Loss	Per Cap.
1912—Whole country.	95,410,503	\$206,438,900	2.16
300 cities .....	32,326,633	\$82,297,386	2.55
1913—Whole country.	97,163,330	\$203,763,550	2.10
298 cities .....	33,281,804	\$74,876,608	2.25
1914—Whole country.	98,781,324	\$221,439,350	2.24
298 cities .....	40,213,280	\$93,868,795	2.32

	Population	Total Loss	Per Cap.
1915—Whole country.	100,399,318	\$172,033,200	1.71
333 cities .....	35,161,266	\$68,386,218	1.94
1916—Whole country.	102,017,312	\$214,530,995	2.10
329 cities .....	36,055,568	\$79,440,658	2.20

\*Estimated. †Actual figures reported.

See the article FORESTRY.

**FISH AND FISHERIES.** Two reports of the United States Commissioner of Fish and Fisheries appeared in 1917, bringing the subject up to June 30, 1917. In each of these reports the commissioner stated that the work of fish propagation had been carried on to better advantage and with greater success than in the preceding year. The totals are given in the following table; for the separate items the original reports should be consulted.

	Eggs	Fry	Fingerlings, yearlings, and adults
1916 ..	425,700,794	4,329,300,337	92,261,435
1917 ..	318,939,100	4,757,908,782	82,115,411

The unit cost of fish-cultural operations in 1916 was \$117.86 per million fish produced and

planted; in 1917 it was \$114.46 per million. In 1916 fish were distributed to every State in the Union and to Alaska. In 1917, in addition to this distribution, trout eggs were sent to Japan and to Canada, and a number of species to the Canal Zone. It is worthy of note that while the marine fishes showed an increase in the list of animals hatched and planted there had been for two years a steady decrease in the number of lobsters hatched and set free.

The following table shows the quantity and value of fish landed at Boston and Gloucester in the calendar years 1915 and 1916:

	Pounds	Value
Cod, fresh, 1915.....	34,088,124	\$ 888,852
Cod, salted, 1915.....	10,967,773	384,108
Cod, fresh, 1916.....	35,993,089	1,218,569
Cod, salted, 1916.....	7,629,473	338,813
Haddock, fresh, 1915.....	57,813,050	1,805,452
Haddock, salted, 1915.....	180,594	2,361
Haddock, fresh, 1916.....	60,371,496	1,757,382
Haddock, salted, 1916.....	184,296	4,293
Hake, fresh, 1915.....	14,589,315	277,470
Hake, salted, 1915.....	800,625	5,007
Hake, fresh, 1916.....	13,029,091	334,296
Hake, salted, 1916.....	143,208	2,944
Pollock, fresh, 1915.....	12,961,313	249,188
Pollock, salted, 1915.....	234,640	4,070
Pollock, fresh, 1916.....	15,502,487	881,578
Pollock, salted, 1916.....	101,143	2,088
Cusk, fresh, 1915.....	6,235,801	96,003
Cusk, salted, 1915.....	84,943	2,347
Cusk, fresh, 1916.....	6,016,527	118,415
Cusk, salted, 1916.....	51,770	1,035
Halibut, fresh, 1915.....	3,584,175	801,787
Halibut, salted, 1915.....	286,510	21,509
Halibut, fresh, 1916.....	3,363,521	377,075
Halibut, salted, 1916.....	95,244	8,510
Mackerel, fresh, 1915.....	7,344,574	883,016
Mackerel, salted, 1915.....	8,573,828	231,068
Mackerel, fresh, 1916.....	10,831,631	627,589
Mackerel, salted, 1916.....	5,074,718	421,749
Herring, fresh, 1915.....	4,345,770	89,326
Herring, salted, 1915.....	8,930,800	186,783
Herring, fresh, 1916.....	11,410,016	209,305
Herring, salted, 1916.....	7,223,224	183,344
Swordfish, fresh, 1915.....	2,238,967	221,559
Swordfish, fresh, 1916.....	1,772,312	238,279
Tilefish, fresh, 1916.....	873,142	24,295
Miscellaneous—		
Fresh, 1915.....	3,874,176	87,980
Salted, 1915.....	750	38
Fresh, 1916.....	6,157,997	134,945
Salted, 1916.....	40	2

In 1915 the crab industry of Maryland and Virginia showed a yield of 50,343,268 pounds, with a value of \$981,807; the shad industry in Chesapeake Bay showed a catch of 6,168,669 pounds, with a value of \$849,527, while the alewives of the same region yielded 28,621,710 pounds of a value of \$297,729. The shad fisheries of the Hudson River yielded in 1915, 68,668 pounds, valued at \$8643, and in 1916 only 47,173 pounds, valued at \$5465. On the Pacific coast there were landed at Seattle, Wash., from June, 1915, to July, 1916, 20,528,187 pounds of fish, mainly halibut and black cod valued at \$1,353,894. The report of the commissioner for 1917 gave in detail the value of the Pacific coast fisheries where an appreciable amount of the total is made up of such items as clams, oysters, turtle, whale products, kelp, etc.

The mussel fisheries of the Mississippi Valley as determined for 1914, and included in the 1916 report, showed a value of shells for the year as \$148,960, the pearls found in the shells having a value of \$62,902. Attempts were being made to increase the yield of mussels by the artificial inoculation of fish with the glochidia. In 1915 the number of seals in the Alaska

herd was estimated at 363,872, in 1916 at 417,281, and tentative figures for 1916 were put at 468,692. In the fiscal year 1917 there were sold at public auction 5400 skins, for which \$236,748.50 gross and \$165,793.18 net was obtained.

The commission expended much energy in promoting the use of hitherto unused sea products, the most noticeable being the spiny dogfish, which is canned and sold as "grayfish." Experiments showed that it was not in any way inferior either in food value, digestibility, or palatability to the ordinary food fishes, and the demand for 1917 much overran the supply. On the Pacific coast the "black cod" and in fresh waters the "burbot" and the "bowfin," the latter proving to be an especially favorable fish for smoking, are advocated by the commission. Whale meat had been used, especially on the Pacific coast, and had proved very satisfactory. In addition to the use of the flesh for food, thoroughly satisfactory results are reported from experiments on the tanning of shark skins for leather.

It was reported from California that oysters could be purified from adherent bacteria by treating the beds with hypochlorite of calcium.

The work of the International Council for the Exploration of the Sea was stopped by the European war, and some of the most important of its results have been collected by Alexander Meek into a book with the title *The Migrations of Fish*. The British Marine Station at Port Erin reported that plaice hatched in 1914 were sexually mature in 1917, and the second generation of young fish reared in captivity were then passing through the hatching boxes. See ALASKA.

**FISK UNIVERSITY.** A co-educational institution for the education of negroes at Nashville, Tenn. In the fall of 1917 there were 445 students in all departments and 55 members of the faculty. Volumes in the library numbered 11,865. Productive funds amounted to \$251,087.55 and the income therefrom in 1917 was \$14,205.91. In 1917 a Rehabilitation Fund of \$150,000 was received, largely from the General Education Board and the Carnegie Foundation. Fisk University was founded in 1866. President, Fayette Avery McKenzie, Ph.D., LL.D.

**FITZSIMMONS, ROBERT.** The former heavyweight champion died on October 22, 1917. He was born at Helston, Cornwall, Wales, on June 4, 1862. While he was a youngster his family removed to New Zealand and he was apprenticed to a blacksmith, from which trade he developed his wonderful physique. While Fitzsimmons stood 5 feet 11½ inches tall, his legs were thin and tapering, although muscular and serviceable. He was a middleweight from the hips down, but a heavyweight from the waist to the neck. His arms were long and sinewy and he had a pair of hands that were never excelled in the ring for their size. After boxing with indifferent success in Australia he came to America in 1890. He won the heavyweight title from Corbett at Carson City, Nev., on March 17, 1897, winning by a knockout in the fourteenth round. He lost the title to Jeffries by a knockout in the eleventh round at Coney Island on June 9, 1899. He lost the light heavyweight title to "Philadelphia Jack" O'Brien on December 20, 1905, when he was 43 years of age. Despite his age he continued to appear in the ring with

mediocre success. His last attempt to appear was frustrated by the Boxing Commission of New York State.

**FLANDERS.** Formerly a territory consisting of what are now the Belgian provinces of East Flanders and West Flanders, the southern part of the Dutch province of Zeeland, and a small portion of northeastern France. The name is still applied to this region and particularly, in the great war, to West Flanders. The entire Belgian coast line is in West Flanders. The province of East Flanders has an area of 1158 square miles, with a population at the census of December 31, 1910, of 1,120,335; West Flanders, 1249 square miles, population 874,135. At the end of 1912, the provinces had an estimated population of 1,134,079 and 884,777 respectively. The capital of East Flanders is Ghent (Gand), with (1910) 167,477 inhabitants; including suburbs, 211,519. The capital of West Flanders is Bruges, with (1910) 53,635 inhabitants. Other towns in East Flanders are: Saint-Nicolas, with about 35,000 inhabitants in 1910; Lokeren, 23,000; Renaix, 22,000; Eecloo, 14,000; Grammont, 13,000; Termonde (Dendermonde), 10,000; Oude-narde (Audenarde), 7000; Langemarq, 5000. In West Flanders occurred some of the most violent fighting of the great war. Towns in that province include: Ostende (Ostende), 43,000; Cour-trai, 36,000; Roulers, 26,000; Menin, 19,000; Ypres, 17,000; Thielt, 12,000; Poperinghe, 11,000; Furnes, 7000; Nieuport; Zeebrugge; Dix-mude. See **WAR OF THE NATIONS**.

**FLAX.** For several years before the European war the world's annual production of linseed ranged from about 100,000,000 to 133,000,000 bushels, and that of fibre from 1,000,000 to 2,000,000 pounds. At the end of 1917 data relative to this production were very incomplete. Argentina, the leading linseed growing country of the world, produced in the season of 1916-17 only 4,314,000 bushels, or about 10 per cent of a normal crop. The area devoted to the crop of 1917-18 was estimated at 3,308,727 acres and the yield at 41,653,000 bushels. The production of British India was placed at about 22,000,000 bushels, or about 9 per cent greater than the preceding year. Canada reported a yield of 7,418,000 bushels, valued at approximately \$14,000,000, the quality being rated at 67 per cent of perfect.

The 1917 crop of the United States, as estimated by the Department of Agriculture, amounted to 8,473,000 bushels, or nearly 10,000,000 bushels under the 5-year average of 1911-15. The area, 1,809,000 acres, was 335,000 acres greater than that of the year before, although 377,000 acres under the 5-year average, but the average yield per acre was only 4.7 or 5 bushels less than in 1916 and 3.8 bushels less than the 5-year average. The average farm value on December 1, 1917, was \$2.97 per bushel, which constituted a record price and brought the total value of the crop to \$25,148,000, as compared with \$35,541,000 in 1916, when the corresponding bushel value was \$2.49. Since the outbreak of the European war choice flax fibre has been quoted as high as \$700 per ton on some of the principal fibre markets. The war had made a great demand for the fibre for aeroplanes, and special measures were adopted to stimulate its production in Ireland. The crop was placed under governmental control. See **AGRICULTURE**.

**FLIES.** See **ENTOMOLOGY**.

**FLOKITE.** See **MINERALOGY**.

**FLOOD CONTROL.** See **DRAINAGE**.

**FLOOD PREVENTION.** With the exception of the developments in the State of Ohio referred to in a succeeding paragraph and the improvement of the banks of the Mississippi River in accordance with plans previously developed, there was little of novelty or progress in works aimed at the prevention of flood damage. In several instances where misfortunes due to this cause had occurred in previous years, means were taken to straighten channels, strengthen dams, and remove obstructions.

**MIAMI RIVER CONSERVANCY.** This project for the flood protection of the Miami River Valley in Ohio, advanced during the year and on May 9, there was filed a complete appraisal roll of the Miami Conservancy District in the Conservancy Court, representing the work of 21 months. The total tax levy for the project was \$27,700,000 and the estimated cost was \$24,000,000 for which bonds to the amount of \$25,000,000 were to be issued. Later in the year, an issue of \$10,000,000 five and a half per cent bonds was placed on the market as an initial step in the financing of the project. As outlined in the **YEAR BOOK** for 1916, the work to be performed was divided into a number of contracts including five dams, road construction, levee building, river channeling and excavation, revetments, retaining walls, etc. The great bulk of the work was in earth-moving and concrete construction, the latter consisting of monolithic concrete revetments and flexible-slab revetments, as well as various outlet conduits and of course, the dams themselves. On November 15, bids, which in all cases were informal and conditional on prices of labor, materials, and the attitude of the national government as regards such improvements, were opened. Accordingly, all were rejected except for one contract which involved clearing soil, stripping, and the construction of embankment in levees. The Conservancy District decided to begin the work with its own forces at least, impending a change in industrial conditions.

**SCIOTO RIVER IMPROVEMENT.** On November 13, bids were received by the city of Columbus, Ohio, for the \$1,900,000 river channel widening improvement. The lowest bid received was approximately 72 per cent above the estimated cost, and was rejected. The service director at the time asserted that efforts would be made to modify the conditions by decreasing the yardage of excavation from the channel and making cheaper construction below the water line for the concrete revetments at curves in the channel. Such changes, it was stated, would eliminate the security from flood danger, but not seriously. The Columbus channel widening, it was asserted, would not entirely remove the danger to the town. An essential element was a retarding basin above the city for which a dam had been designed. This scheme was disapproved by the Conservancy Court at Columbus, on the ground that it was not shown that the Dublin Basin was essential to a scheme making Columbus safe from floods, but it was the opinion of most engineers that the dam was necessary and that its design was one of the most ingenious solutions that could be provided for a combined storage and retarding basin. This dam, which is discussed elsewhere (see

DAMS), was notable for its eighty feet of circular weir and its system of storage control valves. The plan was that small floods backing up in the lower part of the reservoir would be taken care of by the small outlet openings, while the large floods reaching to the level of the circular weir would be discharged so as to overflow the farmed lower levels of the valley.

**PROTECTION OF PARIS.** The technical journals in 1917 contained interesting discussions of the various plans that had been proposed following the high water on January, 1910, in the River Seine, which caused such serious damage. This flood of 1910 was the most serious since 1658 and an engineers commission appointed on February 10 of that year, presented a preliminary report, but only a few of the minor protections recommended were carried out and the great majority had not been done by 1917. On July 16, 1914, the Conseil Générale des Ponts et Chaussées gave its approval to definite preliminary work and on March 11, 1915, plans were deposited for saving the capital from floods. On July 13, 1916, the government brought forward the proposal for a law having the same object, and a commission for public works of the Chamber of Deputies discussed the two proposals that were made for the improvement, rendering a detailed report which was published at the end of 1916. The commission approved the government proposal, which in the main embodied the recommendations of the commission of 1910 and gave certain details as to the straightening of the river, the reconstruction of the bridges, certain changes in dams, and the construction of a new discharging channel in addition to deepening the river bed. Finally the various proposals were developed into a plan endorsed by the government and the city of Paris which in 1917 it was decided to have declared a public utility.

It was also planned to increase the depth of the Seine which would involve the straightening of the foundations of some of the larger bridges and doing away with the existing barges at Marly and Bezons, replacing the former by a new structure with two passages each twenty-six miles wide. The improvement also involved the adjustment of the width of the river so as to make the flow regular and prevent obstruction which would involve the excavation of some portions of the banks and the removal of islands. The protection of Paris was early considered in connection with the Marne deviation scheme which involved the improvement of inland navigation and would cost some 261,000,000 of francs. In fact the entire development, it was believed, was being considered in connection with increased navigation by which the whole of the Seine between Rouen and Paris would be deepened so as to permit the passage of vessels drawing 14 ft. 9 in. instead of the present limit of about 10 ft. 6 in. No work was put under way during the year, but discussion was active in connection with the work which would be one of the largest internal improvements to be executed in France. An interesting summary of this work was printed in the *Engineer*, July 6, 1917.

**FLORIDA. POPULATION.** The population of the State in 1910 was 752,619, and on July 1, 1917, it was estimated at 916,185.

**AGRICULTURE.** The acreage, production, and

value of the principal crops as estimated by the United States Department of Agriculture in 1916-17 were as follows:

		Acreage	Prod. Bu.	Value
Corn .....	1917	925,000	13,875,000	\$19,425,000
	1916	820,000	12,300,000	11,070,000
Oats .....	1917	55,000	770,000	775,000
	1916	60,000	900,000	639,000
Rice .....	1917	800	21,000	41,000
	1916	700	18,000	14,000
Potatoes ..	1917	25,000	2,275,000	4,664,000
	1916	18,000	1,332,000	2,664,000
Hay .....	1917	100,000	a 110,000	2,002,000
	1916	75,000	94,000	1,504,000
Tobacco ...	1917	3,100	b 8,410,000	1,944,000
	1916	2,500	3,025,000	908,000
Cotton ....	1917	183,000	c 40,000	10,100,000
	1916	191,000	41,000	6,425,000

a Tons. b Pounds. c Bales of 500 pounds gross weight.

**MINERAL PRODUCTION.** The only important mineral production in the State is phosphate rock. During 1915 this industry was in poor condition, improving slightly in 1916. Shortly after the outbreak of the war in Europe, the phosphate mining companies curtailed their production very materially, or suspended mining altogether. Production in 1916 was less than two-thirds that in 1913, the year before the war. The production in 1915 was 1,358,611 long tons, valued at \$3,762,239, and in 1916 1,515,845 long tons, valued at \$4,170,165. This constituted more than 76 per cent of the entire production of the United States in 1916.

**TRANSPORTATION.** The total mileage of main line in the State was, on June 30, 1916, 3833. The lines having the longest mileage were:

Atlantic Coast line, 947; Seaboard Air Line, 928; Florida East Coast, 522; Louisville and Nashville, 216.

**FINANCE.** The report of the state treasurer for the fiscal year of 1917 showed a balance at the beginning of the year of \$1,077,710. The receipts during the year amounted to \$4,922,028 and the disbursements were \$4,935,929, leaving a balance on hand at the end of the fiscal year of \$1,063,808. The public debt consisted entirely of refunded bonds amounting to \$601,567.

**EDUCATION.** The total school population of the State in 1916 was 302,028; of these 183,607 were white and 118,421 negroes. There were 2099 white schools and 817 negro schools. The total enrollment in the white schools was 135,883 and in the negro schools 62,482. The average daily attendance in white schools was 98,847, and in the negro schools 45,572. The total number of teachers was 5865 of which 4880 were white and 1385 colored. The total expenditure for school purposes was \$3,302,567, of this \$3,054,977 was spent for the maintenance of white schools and \$247,590 for colored schools. The average monthly salary paid to white teachers was \$69.78.

**CHARITIES AND CORRECTIONS.** The charitable and correctional institutions in the State include the Florida Hospital for the Insane at Chattahoochee, the School for the Deaf and Blind at St. Augustine, the Florida Industrial School for Boys at Marianna, the State Prison Farm at Raiford, and the Industrial School for Girls.

**POLITICS AND GOVERNMENT.** The Seminole Indians in the State were, for the first time, assigned a reservation by the legislature. These Indians, who are a survival of the original

tribe, have for many years been without a definite assignment of land. By the action of the legislature, they were granted an area of 100,000 acres near the Ten Thousand Islands. Industrial schools are to be established by the government, and the Indians are to be assisted in agriculture, raising of live stock, and other methods of self support. The city of Moorehaven claimed the distinction of being the first city in the South to elect a woman as mayor. A majority of votes elected Marion N. Horwitz to this office.

**LEGISLATION.** The legislature was in session in 1917, but passed no measures other than of local interest and importance.

**STATE OFFICERS.** Governor, Sidney J. Catts; Secretary of State, H. Clay Crawford; Attorney-General, Van C. Swearingen; Comptroller, Ernest Amos; State Treasurer, J. C. Luning; Superintendent Public Instruction, W. N. Sheats; Commissioner of Agriculture, W. A. McRae; State Auditor, J. Will Yon; Adjutant General, J. B. Christian—all Democrats. Catts, a Democrat, elected on Prohibition ticket.

**JUDICIARY.** Supreme Court: R. F. Taylor, J. B. Whitfield, W. H. Ellis, J. B. Browne, and Thomas F. West; Clerk, G. T. Whitfield.

**STATE LEGISLATURE.** Both houses are Democratic.

**FLORIDA, UNIVERSITY OF.** A State educational institution located at Gainesville, Fla. In the fall of 1917 there were 329 students in all departments and 60 members of the faculty. About 200 students left to enter national service in 1917. Volumes in the library numbered 30,000. Productive funds in 1917 amounted to \$193,800, and income from these funds was nearly \$10,000. There was received also an appropriation from the State of \$82,344 and a State appropriation of \$30,000 for the Agricultural Experiment Station. The Lever Fund brought in revenue amounting to \$44,597. (Charles Hecker, Ph.D., became professor of industrial chemistry. J. L. McGhee, Ph.D., succeeded E. R. Flint as head of the chemistry department. A three-year course in law was substituted for a previous two-year course, and Earl C. Arnold became an additional professor in the College of Law. A. L. Buser was elected athletic coach and physical director. The University of Florida was founded in 1905. President, A. A. Murphree, LL.D.

**FLOUR.** See AGRICULTURE.

**FLOUR MILLING REGULATION.** See, AGRICULTURE; FOOD AND NUTRITION; WHEAT.

**FOOD.** See AGRICULTURAL EXTENSION; AGRICULTURAL LEGISLATION; AGRICULTURE; FOOD AND NUTRITION.

**FOOD ADMINISTRATION.** See AGRICULTURAL LEGISLATION; UNITED STATES AND THE WAR.

**FOOD AND NUTRITION.** The prolongation and ever-widening scope of the war made the food supply a world problem of the first magnitude. Despite unprecedented efforts to stimulate production, as noted elsewhere (see AGRICULTURE, AGRICULTURAL LEGISLATION, FOOD CONTROL, ETC.), and even greater efforts to conserve and equitably distribute available supplies, conditions steadily grew more serious in the belligerent countries, decidedly more grave for many neutral nations, and affected in some degree practically every civilized community on the globe.

**FOOD REGULATION IN THE UNITED STATES.** Upon the entrance of the United States into the war, it was realized that one of its most important services would be the supplying of food to its Allies, even though this would involve a diminution of its own stores, demanding the closest economy and cooperation of the entire nation. Efforts were promptly begun to enlarge Federal authority as to food control, but neither the Food Production Act (see AGRICULTURE) nor the Food Control Act became law until August 10, 1917. See FOOD CONTROL.

In the administration of the act great efforts were made to secure voluntary cooperation. Early in July enrollment of consumers in a food-saving campaign was begun, and in November a house-to-house canvass was made. It was estimated that nearly ten million signatures were obtained to a food pledge promising cooperation with the Food Administration so far as practicable. Display membership cards and buttons became a common sight, and a house uniform for members was also authorized.

Efforts at food conservation in the home were directed primarily toward the saving of wheat, meat (especially beef, mutton, and pork), milk, fats, and sugar. The use of substitutes for these foods was encouraged, notably corn and oat products, fish, vegetables, and home-grown and bulky foodstuffs generally. The reduction of waste was also emphasized.

Hotels, restaurants, dining-cars, boarding-houses, and other food-serving agencies were also quite widely enlisted in the campaign. In such establishments the serving of elaborate table d'hôte meals was discouraged, and steps taken quite commonly to observe "meatless Tuesdays" and "wheatless Wednesdays." Considerable savings of the staple foodstuffs were reported.

In addition to the voluntary campaign, many stringent regulations went into effect, though necessarily quite late in the year. On August 14 the president issued a proclamation requiring elevator operators and millers of wheat and rye to obtain licenses. Two days later the Food Administration Grain Corporation was chartered under government control, to act as its agent in its wheat purchases, sales, and accounting. Sales to the Allies, as well as supplies to the army and navy, were centralized and coordinated in this way. A basic price of \$2.20 per bushel for No. 1 northern spring wheat or its equivalent, at Chicago, was adopted for purchases by the government of the 1917 crop.

In September licenses were required of importers and manufacturers of sugar and its by-products. An International Sugar Committee was also formed to arrange for the distribution of the available sugar supply, particularly that from the West Indies.

Subsequently licenses were required of cold-storage plants, canneries, meat packers, etc., and ultimately of all wholesalers, brokers, and commission men, as well as retailers with gross sales over \$100,000 per year. Profits by such dealers on most staple commodities were restricted to reasonable advances on the actual purchase price, and many trade practices were closely regulated. Licenses were later revoked in a number of cases in which commission dealers were alleged to have allowed foodstuffs consigned to them to spoil. Under the terms of the Food Control Act little direct authority was given over producers or small retailers, but

it was hoped to reach the latter class indirectly when necessary through their sources of supply.

Bakers using over ten barrels of flour per week were licensed in December. Pound loaves of bread were prescribed, and the use per barrel of flour of over three pounds of sugar, six pounds of skimmed milk, and two pounds of shortening (not over 15 per cent of animal origin) was prohibited. Similar regulations were made for crackers and other bakery products. The return of unsold bread, estimated at about 5 per cent in normal times, was forbidden.

Exports of food were also closely regulated under a license system designed to insure against supplies reaching the enemy countries, to meet the Allies' needs as amply as possible, and to protect the domestic supply. In December a Food Purchase Board was formed to coordinate buying for the army, navy, and allied nations.

The first commodity on which an actual shortage developed in the United States was sugar, the supply of which, after November 1, was considerably depleted, especially in the North Atlantic States. Various causes were assigned, among them the heavy shipments abroad, where the shortage was very acute, hoarding by individual consumers and others, and the increased consumption during the summer because of the enlarged home-canning activities. Retail sales in the northeastern States were quite commonly restricted to two-pound or one-pound amounts, and in some cases sugar cards were adopted either by municipalities or by dealers to promote fair distribution. Despite the shortage, retail prices of sugar were as a rule kept around ten cents per pound. Combination sales of sugar were prohibited by the Food Administration, except with corn meal, and confectioners and manufacturers of food products were restricted to one-half their normal sugar supplies from October 26 to January 1, 1918. It was expected that by the latter date the situation would be somewhat alleviated by the arrival of sugar from the new crop. See SUGAR.

The meat supply was another serious world-wide problem. American packing-house practices were being investigated by the U. S. Trade Commission in December. It was realized, however, that one fundamental difficulty was the enormous slaughter of meat-producing animals, the world decrease since the beginning of the war being estimated at 28,080,000 cattle, 54,500,000 sheep, and 32,425,000 hogs. Many of these animals were dairy cattle, this phase, intensified by high prices for feeding-stuffs and scarcity of labor, threatening a shortage of dairy products in the United States. The formation of regional milk tribunals to adjust differences between producers and dealers was announced as one prospective means of relief. See DAIRY-ING.

**FOOD PRICES.** The price of foodstuffs as a whole rose steadily in the United States throughout the year. *Bradstreet's* showed for December 14, 1917, an increase on wholesale prices of thirty-one staple foods averaging 35 per cent above the previous year. Some of the more striking increases were from \$8.60 to \$11.50 per barrel for wheat flour, from \$1.04 to \$2.20 per bushel for corn, and from 56 to 89 cents for oats, from \$5.90 to \$9.50 per barrel for dried peas, from 9.9 to 17.05 cents per pound for live hogs, and from 5 to 9 cents per pound for rice.

On the other hand, cheese, macaroni, and prunes did not change appreciably. Coffee decreased from 10 to 8 cents per pound, and potatoes from \$4.40 to \$3.75 per bushel.

**EUROPEAN FOOD SITUATION.** The food situation in Europe was distinctly more serious than in any previous year of the war, and many drastic measures were promulgated. In Canada a food controller was appointed with wide powers. Among other measures, the manufacture and sale of oleomargarine was again permitted, and the use of bulk cereal products was encouraged. The use of canned vegetables was restricted during the season of fresh goods. Licenses were required for the exportation of most food products.

In Great Britain a food controller took charge late in 1916, when food prices were about 75 per cent higher than at the beginning of the war. A census of food stocks was taken and other measures begun to encourage production. The first attempt at rationing was made February 5 on a voluntary basis. Subsequently possession by consumers of over two weeks' food supply was made a penal offense, and sales by retailers in excess of such a supply made punishable by imprisonment. The use of sugar was restricted, especially in confectionery. Combination sales were also forbidden. Maximum and minimum prices were established for the principal commodities. Closer milling of wheat was required, a September regulation demanding a flour extraction of 81 per cent and allowing the admixture of 20 per cent additional of other grains. This plan was expected to halve wheat consumption.

A similar measure was adopted in France, but the milling percentage of wheat flour was made 90 per cent. The sale of cakes and confectionery was prohibited.

Italy required an 85 per cent milling of wheat, and restricted the consumption of bread to 21 ounces per day for workmen and soldiers and half this amount for others. Meat sales were prohibited on two days per week and sugar restricted to 17.5 ounces per month per person. Maximum prices were fixed for most commodities.

Reports from Germany were conflicting. On March 1 the milling of 94 per cent wheat flour and 84 per cent rye flour was ordered. Somewhat more liberal allowances of bread and potatoes were announced after the fall harvest, but there was increased supervision over secondary food products and many complaints of inequitable distribution. Both in Germany and the countries occupied by it the shortage of milk continued to be one of the most serious questions and occasioned enormous infant mortality.

The food supply of European neutral nations became much more precarious. Switzerland put all imports under government control and used food cards for macaroni and similar products, as well as for bread and sugar. Bread cards were required in Holland after February 5 and the admixture of 30 per cent of potato flour after March 15. The shortage of milk led to the reduction of butter exports from 50 to 15 per cent of the production as compared with the previous year.

Sweden requisitioned all large stocks of cereals, feedstuffs, beans, etc., fixed minimum and maximum prices, and restricted the use of flour, starch, and bran. Spain established an official

provisions board and regulated the price of wheat flour and bread.

Even in Guatemala the situation led to regulation of the sales of foodstuffs, and to government purchases of flour for sale to official bakeries and to the handling of other products. Food prices rose sharply all over the civilized world.

**NUTRITION.** Studies of the year in this field were closely related to the prospective changes in the food supply. Much work was done on the utilization of the various grains. Buckwheat proved an inferior material for bread-making, but 20 per cent of barley seemed satisfactory. Soy bean protein was found a very complete form, while millets and similar grains seemed more useful as sources of carbohydrates. Studies of various vegetable and animal fats indicated that all these products are quite thoroughly digested.

The most prominent phase of the literature of the year was the multiplicity of food leaflets and similar material. Much valuable information was disseminated in this way, as well as by home economics extension workers and other agencies, and aided materially in assisting the nation safely to modify its food habits in response to the emergency conditions. See **FOOD CONTROL**; also **AGRICULTURE**; **AGRICULTURAL LEGISLATION**; **SUGAR**; **WHEAT**, ETC.

**FOOD CONTROL.** Even before the beginning of 1917 it was evident to close observers that the food resources of the United States would be taxed to the utmost to meet all the demands made upon them. Moreover, the sharp advances in prices (q.v.) caused public apprehension. No sooner had the United States entered actively into the war than lively discussion began as to the necessary extent and proper means of food regulation. The problems were given extensive consideration in Congress, which in the "Trading with the Enemy Act," approved October 6, regulated the foreign aspects of the food problem (see **FINANCIAL REVIEW**), and in the Food Control Act, approved August 10, adopted the policy of extensive domestic regulation.

Previous to this act the president had authorized Mr. Herbert C. Hoover, who had had extensive experience in Belgian relief work, to begin in various ways the mobilization of opinion in behalf of food control and also in unofficial ways to begin the conservation of food resources and farm products and the promotion of stable prices. Immediately therefore upon approving the Food Control Bill the president appointed Mr. Hoover as food administrator. Mr. Hoover announced three primary purposes: (1) the elimination of undue speculation, extortion, and waste while stabilizing prices in essential articles; (2) the regulation of exports so as to insure an adequate supply for home consumption together with the greatest possible co-operation with our Allies; thus again preventing price inflation; and (3) to arouse the country to the necessity of food conservation and enlist the active support of all communities in co-operating to this end in order that the armies and civil populations of the Allies might be adequately provisioned.

**FOOD CONTROL ACT.** The preamble of the Food Control Act declared its purpose to be "to assure an adequate supply, and equitable distribution and to facilitate the movement of

foods, feeds, fuel (including fuel, oil, and natural gas), and fertilizer and fertilizer ingredients, tools, utensils, implements, machinery, and equipment required for the actual production of foods, feeds, and fuel, hereafter in this act called necessities; to prevent, locally or generally, scarcity, monopolization, hoarding, injurious speculation, manipulations, and private controls, affecting such supply, distribution, and movement; and to establish and maintain governmental control of such necessities during the war." The law authorized the president: to maintain government control of all necessities for the period of the war; to requisition or commandeer any supplies deemed necessary; to license the importation, manufacture, storage, mining, or distribution of any necessities, and to prohibit licensees from making unjust charges; to prohibit food destruction by speculators; to purchase, store, provide storage facilities for, or sell for cash at reasonable prices wheat, flour, meals, beans, and potatoes; to take over for use or operation by the government of any factory, packing house, oil pipe-line, mine, or other plant by means of which any necessities may be produced; to fix a reasonable guaranteed price for wheat in order to assure a producer a reasonable profit, the act itself specifying \$2.00 per bushel as the standard price for the 1918 wheat crop; to prohibit the use of food, fruits, food materials, or feeds in the distillation of beverages after September 8, 1917; to prohibit the importation of distilled liquors; to commandeer any or all distilled spirits in bond or in stock; to regulate the manufacture of vinous or malt liquors; to fix the price of coal and coke, establish rules for their production, sale, shipment, distribution, apportionment, or storage, or even to take over coke plants and coal mines; to require all producers of coke and coal to sell their products only to the United States through an agency designated by the president; and to procure such stocks of nitrate of soda as may be deemed necessary for increasing agricultural production in 1917-18.

**WHEAT.** On August 14 President Wilson issued a proclamation requiring all persons engaged in storing or distributing wheat or rye and all persons engaged in manufacturing products from wheat or rye, except those operating mills with a capacity of one hundred barrels or less and farmers and cooperative associations of farmers, to take out a government license by September 1. One of Mr. Hoover's first acts was the appointment of a committee to determine a fair price for the 1917 wheat crop. In this connection he announced that it was the intention of the food administration to use every power to control wheat exports; that producers holding back grain in anticipation of higher prices might induce the government to buy the entire crop; and that the holding of larger supplies of wheat or flour than necessary for the ordinary course of business would be prosecuted with vigor. This committee, announced August 15, was composed of men representative of all sections of the country, and included 4 farmers, 1 capitalist, 3 college presidents, 1 banker, 1 professor of economics, and 2 representatives of labor. Its personnel was as follows: Harry A. Garfield, president of Williams College, chairman; Charles J. Barrett, president of the Farmers' Union; William M. Doak, vice-president of the Brotherhood of

Railroad Trainmen; Eugene E. Funk, president of the National Corn Association; Edmund F. Ladd, president of North Dakota Agricultural College; R. Goodwin Rhett, president of the Chamber of Commerce of the United States; J. W. Shorthill, secretary of the National Council of Farmers' Coöperative Associations; James W. Sullivan, of the American Federation of Labor; L. J. Tabor, master of the Ohio State Grange; Professor F. W. Taussig, of Harvard University, chairman of the United States Tariff Commission; Theodore N. Vail, president of the American Telephone and Telegraph Company; and Henry J. Waters, president of the Kansas State Agricultural College.

On August 15 also was announced the formation of a \$50,000,000 corporation to be used in connection with the buying and selling of wheat, and with power to take over the entire 1917 crop if necessary to maintain the prices determined upon. The executive officers of this corporation were: H. C. Hoover, chairman; Julius Barnes, Duluth, Minn., president; Gates W. McGarrah, president of the Mechanics and Metals Bank, New York City, treasurer; E. G. Crowell, Kansas City, Mo., vice-president; Edward Chambers, vice-president of Santa Fé Railway, Chicago, Ill., transportation director; Judge Curtis H. Lindley, San Francisco, Cal., counsel; J. W. Shorthill, secretary of National Council of Farmers' Coöperative Associations, York, Nebr., secretary.

In addition the food administration named twelve men to represent its grain division in the purchasing of wheat at the following twelve terminal points: Baltimore, Buffalo, Chicago, Duluth, Kansas City, Mo., Minneapolis, New Orleans, Omaha, Philadelphia, Portland, Ore., San Francisco, and St. Louis. At the same time the millers of the country announced on August 15, following a conference at Washington, the names of twelve men constituting a committee to represent the milling industry, in accordance with a request of the food administration.

**ORGANIZATION.** The organization of the Federal Food Administration was extensive. In addition to a large group of national food administrators headed by Herbert C. Hoover, and having responsibility for the production and distribution of particular articles, there was in each state a state food administrator who had under his authority and coöperating with him representatives in every important community. The national and State administrators constituted the Federal food board. The support of consumers was secured by a scheme of enrolling families and the issuance of pledge cards indicating family coöperation in the food conservation plan, such cards to be displayed in household windows. Nearly 10,000,000 families were thus enrolled. Similarly practically all of the better class hotels signed pledges. Restaurants issued proclamations for meatless and wheatless days; similarly the consumption of pork was reduced in December. This almost universal popular coöperation was the most far-reaching aspect of the food administration's activities. At a conference on November 30 including representatives of wholesale and retail grocers, fish dealers, butchers, and bakers, arrangements were made for the fixing of the retail prices of more than twenty staple groceries. These were to be periodically redetermined by the coöperation of food administrators and

wholesalers; the prices were to be those which ought to obtain rather than those which must obtain; and the principle of "making the dealers police their own job" was adopted.

**LICENSING.** The above act authorized the licensing of dealers. Under this authority the president issued various proclamations in October and November requiring the licensing of all wholesalers and manufacturers of foods and all retailers doing a gross business of more than \$100,000 per year. Thus the supply of at least twenty important foods from producer to local retailer were brought under public scrutiny. Retail prices were not controlled directly but only through the above indicated indirect pressure of wholesalers.

**SUGAR.** The first article of which an acute shortage was experienced was sugar, and of this the serious shortage was limited to the Atlantic seaboard. Early in the fall Mr. Hoover appealed to the public to reduce its consumption of sugar in order that France and other Allies might be supplied. After repeated efforts the wholesale price of sugar was fixed by a consultation of representatives of the United States, the Cuban government, and various Allies at New York on December 1. Thereafter the food administration gave much attention to the expediting of imports and the distribution of the Louisiana crop. The shortage, however, continued severe in New England and Middle Atlantic States. Dissatisfaction with the sugar situation and other aspects of food control and price regulation led to the beginning of an investigation by a Senate committee in December. At hearings in Washington and New York numerous charges were made against the food administration, especially by Claus Spreckles, of the Federal Sugar Refining Company. To these Mr. Hoover later replied.

**GREAT BRITAIN.** Late in November, 1916, the British Government adopted a policy of food control. The Board of Trade was given extensive power to prevent waste, to regulate the production and distribution of articles, to fix prices, and otherwise to increase and safeguard the food supplies of the country. These activities became so important that a Ministry of Food was finally established with Lord Rhondda as food controller. The first number of the *National Food Journal* issued by the ministry was issued September 12, 1917. Therein the food controller announced that his policy would be to fix prices of articles of prime necessity over which control at all stages could be secured; to prevent speculation; to eliminate unnecessary middlemen; to utilize existing agencies of distribution under the license, control, and supervision of local committees. It was shown that the average of retail food prices in the United Kingdom on August 1, 1917, was 101.7 per cent more than at the outbreak of the war. This advance was explained by the high prices in countries from which food is purchased, by the high ocean freight rates, due in part to war-risk insurance, and by the advances in prices, due to currency inflation.

Only the more important of the numerous food orders may be here indicated. The Ministry of Food took over all imported beans, peas, and pulse; fixed maximum retail prices therefor; and required that they be sold only by weight and for human consumption. Bread orders forbade the sale of bread until it was

twelve hours old; designated the shapes allowable; prohibited the making of currant, sultana, or milk bread; prohibited the use of sugar in bread; required all loaves to be one pound or even pounds in weight; required that no wheat, rye, rice, tapioca, sago, manioc, or arrow root or their products should be used except for human food; grains must not be used except for seed or human or animal food; the extraction of flour from wheat was raised to 81 per cent; maximum retail prices for cereals were fixed, including the 1917 harvest of wheat, rye, oats, and barley; all flour mills using wheat were taken over by the food controller. As regards cakes and pastries all fancy products were prohibited, and the amounts of sugar and wheat flour permissible were prescribed. As regards brewing, the food controller took over all barley except that which had not been kiln dried. In March the output of beer in each quarter was limited to one-third of the output during the corresponding quarter of the year ending March 31, 1916; the manufacture of malt was prohibited, except under license. The food controller took over all imported cheese; laid down rules regarding the taking and distribution of fish; fixed the prices for fruits, jams, and jellies and prescribed the composition of jams and jellies; placed restrictions on the feeding of horses; regulated the buying and butchering of cattle, sheep, deer, goats, and swine; fixed the maximum wholesale price of milk, per gallon, at 13 cents and the retail price, per quart, at 4 cents above the price on the 15th of the same month in 1914; placed all hotels, restaurants, clubs, and refreshment places on a rationed basis; fixed the price of chocolates and restricted the amount of sugar used in manufactures other than jam, marmalade, and condensed milk at 25 per cent of the amount used in 1915. Other orders dealt with the retailing of tea and coffee.

In the autumn maximum prices were established for numerous meat products; special regulations for the sale and distribution of sugar were inaugurated; maximum prices for cheese and butter of various kinds were established; and the supply of various kinds of seed potatoes was brought under control; both wholesale and retail prices of flour and bread were fixed. As an aid in administration committees were formed in towns and counties to administer the new plan of sugar distribution, to carry on a campaign in behalf of food economy, and to assist in carrying out subsequent orders. These committees numbered not more than twelve members each, included at least one woman and one representative of labor, and charged their necessary expenses to the public treasury.

The plan of sugar distribution inaugurated October 1 provided for the licensing of dealers handling this article. Through the post office consumers made application for sugar registration cards; these cards were filled out and returned to the local food committee, which returned to the consumer a sugar registration card authorizing a licensed retailer to sell to the person indicated stipulated amounts of sugar. These cards were then deposited with licensed sugar retailers who were in turn provided with supplies by the central administration.

FRANCE. Food control was less extensive in France than in the Central Powers or even in England. Unlike Germany, she had no blockade of imports until February 1, 1917, and she was

more self-sufficient normally than Great Britain. On the other hand, her rich northern provinces from which she derived large portions of beet sugar as well as wheat and potatoes were in possession of Germany very early in the war. On the other hand, the 1917 crop of cereals, potatoes, and sugar beets was only 770,000,000 bushels, or 300,000,000 bushels less than in 1914. The policy of fixing maximum prices was adopted early in the war, especially as regards cereals and cereal products, as also the purchase by the government of foreign wheat and its distribution throughout the country. This latter function was carried on by the Supply Commission under the Ministry of Commerce, many million dollars' worth of wheat being thus imported. In consequence, bread prices in France advanced less than in England. The policy of fixing maximum prices was extended from wheat, first to oats, rye, barley, bran, and grain offals, and later to sugar, coffee, potatoes, milk, margarine, aliment fats, edible oils, dried legumes, paraffin and petrol, commercial fertilizer, copper, sulphate, and sulphur. Various import prices were also established while throughout the war zone military authorities fixed the prices of articles of food and drinks. These policies were extended in 1917 during the latter half of which for the first time the policy of rationing was introduced as regards sugar and bread. There were the usual restrictions as regards confectionery and pastries; limitations of courses in restaurants and hotels; and increasing detail in the control of distribution. An important feature in the French system was the development of municipal and cooperative meat and produce markets. These later developments were carried out by Edouard Herriot, minister of Public Works, Food Supplies, and Transportation. He was given extensive authority in the provisioning of the civilian population as well as the army. French representatives abroad purchased in 1917 not only wheat but other cereals, sugar, and other foods.

GERMANY. In no country was such careful attention given to the problem of food supplies. Until June 1, 1916, control of foods was vested in the Department of the Interior of which von Delbrück was secretary. On that date a separate department called the War Nutrition Office was created under the direct control of the chancellor, and Adolph von Batocki was appointed to its presidency. Among the powers of this office were the following: to confiscate *in toto* animal and plant products; to determine the amount of produce to be left with producers for further productive uses; to regulate live stock feeding, crop acreage and rotation, use of fertilizer, prices of produce, and the uses that growers may make of their crops; to regulate all milling processes, the use of grain for alcoholic beverages, the manufacture of industrial products from produce of the soil, the disposition of live stock, and the production and distribution of milk; to limit the number of middlemen, both wholesalers and retailers; to regulate the selection of a retailer by a consumer; to fix hours for the sale of foods, the prices that may be charged, and amounts which any one may possess; to regulate restaurants, eating houses and hotels; and to ration the entire population. It is impossible to enumerate the elaborate detail with which these powers were applied. There was an extensive application of

modern chemistry both in the production of new foods and the utilization of great quantities of materials previously wasted, and in determination of necessary allowances for individual diet. In the large cities civic kitchens were established, and in many places field kitchens were sent into the streets, at public expense. It was estimated that these municipal establishments had capacity for 6,000,000 persons daily by the spring of 1917. As made public in October by our government the German ration per week per person included: flour, 3.45 lbs.; potatoes, 7.05 lbs.; cereals, peas, and beans, 7 oz.; meat, 8.8 oz.; fats, 5.6 oz.

In December considerable publicity was given to a petition of the Municipal Council of Neuköln (Berlin) to the Food Distribution Department in which it was alleged that large manufacturers had purchased great quantities of food which they were selling to their employees at extortionate rates; and that municipal authorities in order to avoid popular discontent with this policy of the manufacturers had themselves advanced food prices beyond the maxima set by the Imperial authorities.

**ITALY.** Immediately upon Italy's entrance in the war in May, 1915, the government took measures to conserve foodstuffs. Previously decrees had prohibited the exportation of numerous articles; subsequently this embargo list was greatly extended. Import duties on grain and flour had been abolished in January, 1915, and shortly thereafter the government took measures to facilitate the importation of grain by the establishment of provincial grain purchasing associations and regulation of maritime and railway facilities. Bread making and milling were standardized; efforts were made to increase harvests; maximum prices were fixed in January, 1916, for domestic wheat, corn, and flour, and later for sugar, and finally for all articles in common use. In August, 1916, the Minister of Agriculture was given most extensive powers of food control. Finally, on January 16, 1917, a Commissioner General for Food Supplies was created under the general control of a commission consisting of the Ministers of Agriculture, Interior, and Maritime and Railway Transportation. Thereafter regulations became steadily more specific and detailed. Meanwhile, the larger cities, notably Genoa, Milan, Florence, Venice, and Rome had also inaugurated extensive programmes of food control and price regulation.

**OTHER COUNTRIES.** Reports from Austria-Hungary indicated that conditions there were much worse than in Germany; and that central and local governments were using extraordinary powers to prevent starvation by regulating prices, production, distribution, and consumption. From all Scandinavian countries, Holland, Finland, and Russia also came numerous reports of crucial food shortage. Commissions from Norway, Finland, and Holland sought release of food supplies by the National Food Administration for shipment to their respective countries. On December 21 some 40,000 tons of grain were thus released for starving Finns. By an arrangement with other Allies the United States agreed to supply stipulated quantities of food to Switzerland and Holland. See **AGRICULTURE; AGRICULTURAL LEGISLATION; CANADA; FOOD AND NUTRITION; GARBAGE AND REFUSE DISPOSAL; WHEAT; SUGAR, ETC.**

**FOOTBALL.** Football was more widely played during 1917 than ever before despite the fact that Yale, Harvard, and Princeton, three of the leading football colleges of the East, were not formally represented on the gridiron. To offset this condition the sport was taken up at the various army and navy training stations where many of the star players of former years were preparing for the war game. The smaller colleges, by reason of the elimination of the "Big Three," had the satisfaction of gaining the limelight in this sport to an extent undreamed of heretofore. It was possible also as a result of the unusual conditions to determine definitely the strongest elevens in the various sections of the country.

The leading college team in the East was without question that of the University of Pittsburgh. In the Middle West, Ohio State University once more attested to its superiority among the Conference elevens. The South produced an extraordinarily strong team in the Georgia School of Technology. Nebraska reigned supreme in the Missouri Valley, while the University of Oregon again carried off the laurels on the Pacific Coast. The host of the "Service" teams was undoubtedly the Newport Naval Reserves led by the former Yale star, "Cupid" Black.

One result of the war as affecting football was the small attendance at the games in comparison with other years. This was most noticeable in the East and was chiefly due to the absence of contests in which Harvard, Yale, and Princeton were wont to figure. Games between college teams and service combinations were played in New York and Boston, the two leading centres of the sport in normal years, but they failed to draw the large crowds anticipated.

The good showing made by the University of Pennsylvania team, after an inauspicious start, aroused interest in Philadelphia and the usual gridiron fixtures held there were fairly well attended. In the West and South, the number of spectators at the big games was, if anything, larger than in former years.

Walter Camp, owing to the conditions, did not attempt to name an All-America team, but contented himself with selecting what he termed the "Stars of 1917." Those singled out by the Yale football authority follow:

Ends—Robeson, Rutgers; Weeks, Brown; Miller, Pennsylvania; Tressel, Pittsburgh; Calac, West Virginia; Carroll, Washington and Jefferson; Carlson, Pittsburgh; Kelley, Wisconsin; Castellanos, Colgate; Zimmerman, Washington State; Bolen, Ohio State; Adams, Vanderbilt; Ecklund, Minnesota; Klein, Illinois.

Tackles—Henry, Washington and Jefferson; Hauser, Minnesota; Cobb, Syracuse; Carpenter, Georgia Tech.; Ice, West Virginia; Walker, Oregon Aggies; Randall, Rutgers; Rundquist, Illinois; Bonner, Auburn; Maynard, Pennsylvania; Sinclair, Brown; Gordon, California.

Guards—Sies, Pittsburgh; Rollins, Rutgers; Stiles, Washington State; Sutherland, Pittsburgh; Bonner, Auburn; Lynch, Holy Cross; Cleary, Pennsylvania; Neeley, Dartmouth; Higgins, Chicago.

Centres—Bailey, West Virginia; Robertson, Syracuse; Way, Pennsylvania; Guy, Washington and Jefferson; Phillips, Georgia Tech.; Van Dyne, Ohio State; Hansen, California.

Quarterbacks—Bell, Pennsylvania; Boynton,

Williams; Meehan, Syracuse; Steers, Oregon; Cresswell, Occidental; Morrison, Pomona; Mallette, Southern California; Hill, Georgia Tech.; Simpson, Wisconsin; Cook, Nebraska.

**Backs**—Guyon, Georgia Tech.; McLaren, Pittsburgh; Berry, Pennsylvania; Bangs, Washington State; Rodgers, West Virginia; Harley, Ohio State; Strupper, Georgia Tech.; Whitehill, Rutgers; Ducote, Auburn; Straus, Pennsylvania; Flower, Davidson; Harlan, Georgia Tech.; McQuade, Georgetown; Easterday, Pittsburgh; Kelly, Rutgers; Gillo, Colgate; McCreight, Washington and Jefferson; Boone, Washington State; Cornog, Dartmouth; Wells, California; Murphy, Washington; Newman, Oregon Aggies; Koehler, Northwestern.

A summary of the games played by the leading college teams follows:

Pittsburgh 14, West Virginia University 9; Pittsburgh 40, Bethany 0; Pittsburgh 41, Lehigh 0; Pittsburgh 28, Syracuse 0; Pittsburgh 14, Pennsylvania 6; Pittsburgh 25, Westminster 0; Pittsburgh 13, Washington and Jefferson 10; Pittsburgh 27, Carnegie Tech. 0.

Syracuse 14, Rutgers 10; Syracuse 0, Pittsburgh 28; Syracuse 58, Tufts 0; Syracuse 6, Brown 0; Syracuse 42, Bucknell 0; Syracuse 27, Colgate 7; Syracuse 2, Michigan Aggies 7.

Rutgers 25, Ursinus 0; Rutgers 10, Syracuse 14; Rutgers 33, Lafayette 7; Rutgers 28, Fordham 0; Rutgers 7, West Virginia 7; Rutgers 61, Springfield Y. M. C. A. College 0; Rutgers 14, Newport Naval Reserves 0.

Brown 27, Rhode Island 0; Brown 20, Johns Hopkins 0; Brown 27, Worcester 6; Brown 7, Boston College 2; Brown 7, Colgate 6; Brown 0, Syracuse 6; Brown 0, Newport Naval Reserves 35; Brown 19, Colby 7; Brown 13, Dartmouth 0.

Pennsylvania 73, Albright 0; Pennsylvania 0, Georgia Tech. 41; Pennsylvania 10, Swarthmore 0; Pennsylvania 20, Bucknell 6; Pennsylvania 6, Pittsburgh 14; Pennsylvania 27, Lafayette 0; Pennsylvania 23, Pennsylvania Military College 0; Pennsylvania 7, Dartmouth 0; Pennsylvania 16, Michigan 0; Pennsylvania 26, Carlisle 0.

U. S. Naval Academy 27, Davidson College 0; Navy 0, West Virginia 7; Navy 62, Maryland State 0; Navy 61, Carlisle 0; Navy 89, Haverford 0; Navy 95, Western Reserve 0; Navy 28, Georgetown 7; Navy 80, Villanova 3.

U. S. Military Academy 28, Carnegie Tech. 0; Army 34, Virginia Military Institute 0; Army 26, Tufts 3; Army 21, Villanova 7; Army 2, Notre Dame 7; Army 28, Carlisle 0; Army 50, Lebanon Valley 0; Army 13, Boston College 7.

Georgia School of Technology 33, Wake Forest 0; Georgia Tech. 25, Furman 0; Georgia Tech. 41, Pennsylvania 0; Georgia Tech. 32, Davidson 10; Georgia Tech. 63, Washington and Lee 0; Georgia Tech. 83, Vanderbilt 0; Georgia Tech. 48, Tulane 0; Georgia Tech. 98, Carlisle 0; Georgia Tech. 68, Auburn 0.

Ohio State University 49, Case 0; Ohio State 53, Ohio Wesleyan 0; Ohio State 40, Northwestern 0; Ohio State 67, Denison 0; Ohio State 26, Indiana 3; Ohio State 16, Wisconsin 3; Ohio State 13, Illinois 0; Ohio State 0, Auburn 0.

According to figures compiled by the Associated Press football caused the death of twelve players during 1917, or three less than in the previous year. With one exception the victims

were high school students or players who had had little training.

The Fall River Rovers won the soccer championship of the United States by defeating the Bethlehem Steel Co. Football Club, winner of the American Challenge Cup. The score was 1 to 0. Haverford captured the American intercollegiate honors.

**FORAGE POISONING.** See VETERINARY MEDICINE.

**FORAKER, JOSEPH BENSON.** An American political leader, died in Cincinnati, Ohio, May 10, 1917. He was born near Rainsboro, Ohio, July 5, 1846. From 1862, when he enlisted in the 89th Ohio Volunteer Infantry, he fought to the end of the Civil War, rising to the rank of brevet captain. He was with Sherman on his march to the sea. Afterward he attended Ohio Wesleyan University for two years, at the same time studying law, and in 1869 he graduated at Cornell, after a year at that university. Soon after his admission to the Ohio bar, he became active in politics. From 1879 to 1882 he served as judge of the superior court of Cincinnati, and by 1885 had become governor of the State, an office to which he was reelected two years later. During his two terms in the United States Senate (1897-1909) he was much of the time in the public eye because of his aggressive personal attacks on prominent men. He had early begun a fight against Mark Hanna, boss of the Ohio Republican machine, and later a man of national importance, and upon Hanna's death Foraker became State leader of his party. He was a conspicuous figure in every Republican National Convention from 1884 to 1904, and presented McKinley's name for the presidential nomination in 1896 and 1900. During Theodore Roosevelt's second term he was a violent opponent of the president, and in fact became recognized as the mouthpiece of anti-Roosevelt sentiment. Taft, then Roosevelt's lieutenant, came in for his share of Foraker's enmity. He gained the nicknames of "Fire Alarm" Foraker and "the bulldog of politics." In constructive politics, he was known as an early champion of the Cuban revolt against Spain, and as a promoter of the Panama Canal project and of the measure which made its construction possible—the Hay-Pauncefote treaty. Foraker's political downfall resulted, as he himself admits, in his *Notes on a Busy Life* (1916), from the publication by William Randolph Hearst of the Archbold letters, which indicated that the senator had received retainers from the Standard Oil Company while in office. This incident occurred in 1909 and Foraker retired the same year to the practice of law. An attempt to reënter politics in 1914 as candidate in the Republican primaries for the senatorial nomination, was unsuccessful.

**FORDHAM UNIVERSITY.** A Roman Catholic institution of learning located in New York City. In the fall of 1917 there were 1356 students, enrolled as follows: Arts and sciences, 371; law, 406; medicine, 285; pharmacy, 115; sociology, 179. There were also 194 members of the faculty. Volumes in the library numbered 73,000. Fordham was founded in 1841. President, Rev. Joseph A. Mulry, S. J.

**FORD TRUCKS.** See AUTOMOBILES.

**FOREIGN EXCHANGE.** See FINANCIAL REVIEW.

**FOREIGN TRADE.** See FINANCIAL REVIEW.

**FORESTRY.** The fall of 1917 was one of the driest on record and most favorable for the spread of destructive forest fires. This was especially true in the Pacific Northwest where 7688 fires were extinguished by private, State, and forest service employees. All interests for forest protection combined employed 2579 regular patrolmen outside of about 12,000 extra fire fighters, the total expenditure for fire protection by all concerned being \$1,825,000.

There was an unusual prevalence of incendiarism, especially in regions where timber was being cut to meet urgent war needs. In August the governor of Oregon placed detachments of troops throughout the State where trouble prevailed and incendiary fires stopped at once. The governor also closed the hunting season after it had been open for a week. In the State of Washington the forest fire wardens controlled bad fires at the expense of those responsible for their origin, and this provision of the Washington law was commended by authorities in other States. Taking the fire season as a whole, many bad fires occurred, but the property loss was relatively small as compared with previous bad fire seasons and no loss of life was reported.

**FORESTERS AND THE WAR.** With the entry of the United States into the war it became quickly recognized that American foresters and lumbermen could render the same valuable assistance to the allied armies in France that Canadian foresters and lumbermen were already rendering. A regiment known as the 10th Engineers (Forest) was organized and trained at American University Park, Washington, D. C., during the summer, and reported in France late in September. A second regiment, the 20th Engineers (Forest), was being trained late in the year. The ten battalions of foresters, woodsmen, and lumbermen were a strength of 7500 enlisted men. In addition, there were to be nine service battalions with a strength of 7250 enlisted men comprised of laborers. United States Forester Henry S. Graves was commissioned as a lieutenant colonel in charge of the division of forestry of the American expeditionary forces. All lumbering operations, in so far as is consistent with the needs of the armies, will be conducted with respect to the reforestation and future growth of the woodlands.

**THE NATIONAL FOREST SERVICE.** The total net area of the 152 national forests on June 30, 1917, was 155,166,619 acres. Over seventy million acres had been examined in the work of releasing agricultural lands for homestead entry. Up to 1917, 11,912,473 acres had been eliminated from the national forests and 921,046 acres of land chiefly valuable for forestry had been added to them. In addition, 947,198 acres had been acquired by purchase under the act of March 1, 1911, for the establishment of water-shed forests in the White Mountains and Southern Appalachians. The total receipts from the national forests for the year ended June 30, 1917, amounted to \$3,450,000 or over \$600,000 more than in the banner year 1916. The cost of operating the forests was about \$4,000,000 or virtually the same as in 1916. Of the receipts \$926,530 was allotted for the year commencing July 1, 1917, to the States in which the forests were situated, for county, school, and road purposes. One million dollars also became available under the Federal Aid Road Law (see article *Forestry*, YEAR BOOK for 1916) for the devel-

opment of roads and trails within or partly within the national forests.

An increase of 25 per cent in the grazing fees on all national forests went into effect in 1917. The national forest ranges usually pasture 1,800,000 cattle and horses and 7,800,000 head of sheep. As a war emergency measure these numbers were increased somewhat in 1917. The Biological Survey of the U. S. Department of Agriculture reported that prairie dogs had practically been destroyed over 767,000 acres of national forest range within the previous five years. During this period, a total of about 2,500,000 acres of government land in the West had been relieved of range-destroying rodents.

War emergency work in the field of forest products has assumed such large proportions that it has been necessary for the Forest Products Laboratory at Madison to discontinue most of the peace-time investigations. A very important part of the work relates to methods of conditioning rapidly, through artificial seasoning, woods used in the manufacture of rifles, airplanes, and vehicles. Material assistance in these directions was rendered to the War and Navy Departments, to the Shipping Board and the Emergency Fleet Corporation, to various committees of the Council of National Defense, and to manufacturers of war orders.

By the use of an improved process developed at the laboratory, operating expenses in the production of ethyl or grain alcohol from wood waste could be reduced by \$300 per day. Experiments conducted in pine forests in Mississippi indicated that the yields of turpentine and rosin could be increased by 30 per cent or more the first year by cutting two narrow faces rather than one broad face on the trees per week, thereby increasing the net returns by about \$450 per crop of 10,000 faces. A process was perfected under which hemlock shiplap could be dried to shipping condition with practically no loss of grade in forty to forty-eight hours. Further study of the utilization of various waste barks, for the manufacture of pulp and paper products, were made on eight species. Tests under the soda process of making paper were continued for thirteen species, and a good quality of pulp suitable for high grade wrapping paper was secured from eighteen species by using the sulphate process of making paper. Data from tests of mechanical properties of various species of wood make possible scientific grading rules for structural timber, such as already perfected for southern pine.

**LUMBER AND BY-PRODUCTS.** According to the estimate given by the lumber committee of the Council of National Defense, 2,000,000,000 feet of lumber, or about 5 per cent of the country's annual output, would be required for purposes directly connected with the war in 1918. The forest resources of the United States were fully able to meet the unprecedented demands upon them without materially reducing our reserve timber supply. The emergency which the lumber industry was meeting had not been in the volume of the wood required, but rather in the urgency and special requirements. These could all be met, although, in some cases, not as promptly as might be desired.

**PULPWOOD.** According to statistics collected by the forest service in cooperation with the News-Print Manufacturers' Association, the consumption of pulpwood in the United States in

1916 by the 230 establishments reporting was 5,228,558 cords, an increase of 757,795 cords, or 17 per cent over the 4,470,763 cords consumed by the 223 mills reporting in 1914, the last year for which statistics of this kind were compiled. Of the total consumption 4,444,565 cords were of domestic production and 783,993 cords were imported. The quantity produced during 1916 amounted to 3,271,310 tons and represents an increase of 378,160 tons, or 13 per cent more than the 2,893,150 tons produced in 1914. Canada produced 1,764,912 cords of pulpwood for home consumption and exported 1,068,207 cords in 1916.

According to the report of The American Wood Preservers' Association for 1916 a total of 150,522,982 cu. ft. of wood was treated by the 117 treating plants reporting. The quantity of the preservatives used by the industry during 1916 in the treatment of the 150,522,982 cu. ft. of wood reported amounted to 90,404,749 gallons of creosote and refined water-gas-tar, 26,746,677 pounds of zinc chlorid, 5,675,095 gallons of paving oil, and 582,754 gallons of miscellaneous preservatives.

In Great Britain a scheme for the collection and utilization of horse chestnuts for munition purposes was approved and active steps were taken to collect a supply of horse chestnuts through the school children. Experiments conducted show that for every ton of horse chestnuts that are harvested a half ton of grain can be saved for human consumption.

**NEW LEGISLATION.** Congress prohibited any further additions to the national forests areas in Washington, Oregon, California, Idaho, Montana, and Wyoming, except exchange of government timber for privately owned lands in certain of these forests which may be chiefly valuable for the production of timber or the protection of stream flow. Additions to the National Forests of Colorado were authorized as the result of a petition of the people of the State. Oregon and Tennessee provided for stringent laws relative to setting fires in woodlands through clearing up land. Nebraska authorized counties, cities, and villages to acquire and operate adjoining forest reserve tracts. A State forestation commission was also established. Additional State forests were authorized in Minnesota, together with a survey of public lands with special reference to securing lands which would be suitable for reforestation with pulpwood species.

**FOREST SCHOOLS, PERSONNEL, ETC.** In Venezuela a presidential decree of March 12, 1917, created an experiment station of agriculture and forestry, with an acclimatization garden, to be located near Caracas and intended to serve as a model for other such stations to be established elsewhere in the Republic. H. Pittier, recently of the U. S. Department of Agriculture, was in charge of the station. A department of forest chemistry was established at the New York State College of Forestry, with Dr. S. F. Acree, formerly of the U. S. Forest Service Laboratory, in charge. The college was also offering a course in city forestry. The University of California announced a correspondence study course on *Lumber and Its Uses*. A one-year course in lumbering was inaugurated by the Forest School of the Georgia State College of Agriculture. A court decision confirmed the title of the University of California in the so-

called Whitaker's forest, a splendid body of timber of 320 acres situated in Tulare County. The area was willed to the university six years ago, both for experimental purposes and as a park, but was in liquidation.

With the year 1917 *Forestry Quarterly*, which completed its fourteenth volume in December, 1916, was amalgamated with the *Proceedings of the Society of American Foresters* under the title *Journal of Forestry*. The new magazine was published in eight monthly issues, with the exception of June, July, August, and September, and remained essentially the same in character as the former publications. The experiment stations in the Netherlands Indies are issuing a journal, *Archief voor de Rubbercultuur in Nederlandsch-Indië*, the first number of which appeared in February, 1917. This journal was to include all of the stations' articles on rubber and will supersede the various bulletins and pamphlets previously publishing such articles. Although the articles will be written in Dutch, extensive abstracts or summaries in English treating all important points will be added. The committee of editors was composed of the directors and scientific officers of the experiment stations. *The Gum Tree*, a new publication, is the official organ of the Australian Forest League. It was published in the interests of scientific forestry and conservation in Australia.

Important works published in 1917 or the preceding year were:

**BIBLIOGRAPHY.** J. P. Kinney, *The Development of Forest Law in America and The Essentials of American Timber Law* (New York, 1917); T. S. Woolsey, Jr., *French Forests and Forestry* (New York, 1917); D. E. Hutchins, *A Discussion of Australian Forestry, with Special References to Forestry in Western Australia, the Necessity of an Australian Forest Policy, and Notices of Organized Forestry in Other Parts of the World; together with appendices relating to Forestry in New Zealand, Forestry in South Africa, and Control of the Rabbit Pest* (Perth, Australia, 1916); A. D. Webster, *British-Grown Timber and Timber Trees* (London, 1916); M. Rothkugel, *Los Bosques Palagonicos* (Buenos Aires, 1916); J. L. B. Taylor, *Handbook for Rangers and Woodsmen* (New York, 1917); E. H. Wilson, *The Conifers and Tawads of Japan* (Pubs. Arnold Arboretum No. 8, 1916); H. D. Tiemann, *The Kiln Drying of Lumber* (Philadelphia and London, 1917); American Wood-Preservers' Association, *Handbook on Wood Preservation* (Baltimore, 1916). See **WATER WORKS**.

**FORLANINI AIRSHIP.** See **MILITARY PROGRESS**.

**FORMOSA, or TAIWAN.** An island dependency of Japan, off the coast of the Chinese province of Fukien. The capital is Dai-Hoku (or Taipei). The area of the island of Formosa is 2318 square ri (35,759.5 square kilometres); of the seven adjacent isles, 5.6 square ri (86.4 square km.); total, 2324.1 square ri (35,845.8 square km., or 13,840 square miles). This area is a little larger than the combined extent of Massachusetts and Connecticut. The estimated population at the end of 1916 was 3,710,848 (1,942,007 males, 1,768,841 females); at the end of 1914, 3,598,434, of whom 3,437,017 were indigenes, 141,835 Japanese, and 19,582 foreigners. Population of Dai-Hoku (consisting of Jonai,

Moko, and Daitote) on December 31, 1911, 95,077; Dainan (or Tainan), 59,601.

The most important agricultural product is rice. Other products are sugar-cane, tea, sweet potatoes, jute, ramie, and indigo. The yield of rice in 1914 is stated at 4,608,256 koku, and in 1915 4,784,578 koku (1 koku equals 5.119 bushels U. S.); sugar, 251,279,219 kin in 1914, and 347,446,398 kin in 1915 (1 kin equals about 1.323 pounds, or 0.6 kilogram); tea, 22,723,565 kin and 25,432,126 kin; sweet potatoes, 721,162 and 709,080 metric tons; jute, 4,490,323 and 4,061,679 kin; ramie, 1,632,197 and 1,573,009 kin; indigo, 2,408,608 and 2,290,719 kin. An important forest product is camphor, which is worked as a government monopoly. The output of camphor in 1914 was 4,558,124 kin and in 1915, 4,620,183 kin; camphor oil, 5,466,732 and 6,881,242 kin.

The following mineral products are reported for 1914 and 1915 respectively: coal, 345,529 and 382,403 metric tons; sulphur, 1205 and 1377 metric tons; gold, 365,607 and 438,685 momme (1 momme equals 0.12057 Troy ounce, or 3.75 grams); gold dust, 23,199 and 27,280 momme; silver, 426,438 and 395,241 momme. The total mineral output in 1913 was valued at 4,015,102 yen, and in 1914 at 4,439,416 yen (the yen has a par value of 49.846 cents). Output value in 1913 and 1914 respectively, in thousands of yen: gold, 1502 and 1823; coal, 1222 and 1311; copper, 998 and 1056; silver, 63 and 57; other minerals, 230 and 188. Fishery produce was valued at 1,412,118 yen in 1913, and 1,662,656 yen in 1914.

Live stock at the end of 1913 and 1914 respectively: cattle, 428,307 and 404,507; goats, 129,094 and 124,682; swine, 1,321,920 and 1,313,389; horses, 179 and 137.

Manufactures include flour, sugar, spirits, tobacco, oil, soap, glass, and brick.

Imports and exports of merchandise were valued at 64,954,658 yen and 112,272,285 yen respectively in 1916, as compared with 53,369,270 and 75,623,174 in 1915, and 52,893,085 and 58,720,430 in 1914. Imports from and exports to foreign countries and from and to Japan have been as follows, in yen:

	Imports		Exports	
	Foreign	Japan	Foreign	Japan
1906	12,737,460	15,634,341	9,779,084	18,259,528
1911	19,555,047	33,789,556	13,175,590	51,648,580
1912	19,307,126	43,325,290	14,960,228	47,881,451
1913	18,023,724	42,835,593	12,942,442	40,446,020
1914	14,013,937	39,879,148	12,942,314	45,738,116
1915	12,781,778	40,587,492	15,430,278	60,192,896
1916	15,430,087	49,524,621	31,652,474	80,619,811

In 1915, classified imports and exports (both the foreign and the Japanese trade) included the following, in thousands of yen: rice, other cereals, flour, etc., 3107 and 8396; provisions, beverages, and tobacco, 12,355 and 47,252; drugs, dyes, etc., 5713 and 13,433; cotton fabrics, yarn, etc., 1726 and 1302; minerals, pottery, metal goods, etc., 6437 and 3199.

Trade in merchandise by countries, in thousands of yen:

	Imports		Exports	
	1915	1916	1915	1916
Japan	40,587	49,525	60,193	80,620
China	7,663	7,329	4,994	10,389
British India	1,678	2,586	258	358

	Imports		Exports	
	1915	1916	1915	1916
Great Britain	712	1,284	932	781
Hongkong	21	26	584	1,785
United States	762	761	6,180	7,539
Australia	11	9	61	5,280
Total, incl. others	53,369	64,955	75,623	112,272

In 1916, there were in operation 318 miles of government railway and 961 miles of private light railway. In addition there were private tracks for hand-pushed cars, totaling 697 miles; these tracks, peculiar to Formosa, are the most important means of local communication. Telegraphs in 1916: 160 offices, with 632 miles of line and 2618 miles of wire. Post offices in 1916, 159.

Revenue and expenditure in the fiscal year 1914-15 were 53,164,329 yen and 47,695,835 yen respectively; ordinary revenue was 39,007,619 yen, and ordinary expenditure 32,447,621 yen. The budget for 1916-17 balanced at 39,980,903 yen, and for 1917-18 at 47,474,727 yen. Estimated ordinary revenue for 1917-18 was 41,694,901 yen, including receipts from public undertakings and state property, 31,524,804 yen; inland taxes, 7,435,807; stamps, 1,073,040. Estimated ordinary expenditure for 1917-18, 35,966,299 yen, including: monopoly bureau, 12,000,276 yen; government railways, 3,568,276; communications, 1,606,439; administration office, 1,303,343; local governments, 989,536. Government monopoly is established in respect of opium, salt, camphor, and tobacco. The government prohibits opium smoking except in the case of certain confirmed smokers who are licensed to use the drug as medicine. The number of licensed smokers has decreased year by year and stood at 66,847, as compared with 169,064, the maximum number, in 1900. Formosa is administered by a Japanese governor-general.

**FORTY IMMORTALS.** See ACADEMY, FRENCH.

**FOSTER, JOHN WATSON.** An American diplomatist, dean of the American diplomatic corps and father-in-law of Hon. Robert Lansing, secretary of state, died November 15, 1917, in Washington, D. C. He was born in Pike Co., Ind., March 2, 1836, graduated at Indiana State University in 1855 and in 1857 was admitted to the bar. When the Civil War broke out he entered the Union service as a major of volunteers, and after promotion to the rank of colonel was given command of a brigade in Gen. Burnside's expedition to east Tennessee and was the first to occupy Knoxville (1863). After the war he turned to newspaper work in Evansville, Ind., where he edited the *Daily Journal* in 1866-69 and was postmaster in 1869-73. He was minister to Mexico in 1873-80, minister to Russia in 1880-81, and minister to Spain in 1883-85. In 1891 Foster was engaged to assist President Harrison and Secretary Blaine to negotiate reciprocity treaties, with the result that treaties were made with France, Germany, Austria, Spain, and with all the South American republics except Colombia and Venezuela. During the Bering Sea controversy he was agent for the United States before the arbitration tribunal (1893). Upon the death of Secretary Blaine, Foster became secretary of state (1892-93). Later he was legal adviser to the Chinese plenipotentiaries in

their peace negotiations with Japan (1895); again represented the United States in the Bering Sea question (1897); and in 1898 he was a member of the Anglo-American Joint High Commission to settle outstanding disputes between Canada and the United States. He was agent for the United States in 1903 before the Alaska Boundary Commission; and in 1907 he was delegate from China to the Second Hague Conference. After 1907 he retired to private life in Washington. He published a biography of his father, Judge Matthew Watson Foster (1896); *A Century of American Diplomacy* (1900); *American Diplomacy in the Orient* (1903); *Arbitration and the Hague Court* (1904); *The Practice of Diplomacy* (1906); *Diplomatic Memoirs* (1909). He contributed an introduction to Mannix's *Memoirs of Li Hung Chang* (1913). In 1916, on his eightieth birthday, he received from Yuan Shih-Kai, first president of the republic of China, the Order of the Golden Grain, in recognition of his political services to that country.

**FRANCE.** The most westerly state of Central Europe, extending from 42° 20' to 51° 5' N. lat., and from 7° 45' E. to 4° 45' W. long., bounded on the north by the Channel and Straits of Dover, which separate it from England. Its circumference is estimated at about 3000 miles, and its area at 207,129 square miles. The territory lost in 1871 amounted to 5602 square miles. France is divided into eighty-seven departments, including the island of Corsica, in the Mediterranean, off the west coast of Italy. The principal rivers are the Seine, Loire, Garonne, and Rhône; the principal forests, Ardennes, Compiègne, Fontainebleau, and Orléans. This country has been a republic since September 4, 1870, under a constitution revised in 1875, '84, '85, and '89. In the War of the Nations France was an original member of the Triple Entente. War was declared on France by Germany August 3, 1914, and on August 10 France declared war on Austria-Hungary.

In the northern section across which contending armies have long raged, riddling fertile fields with trenches, destroying timber and fruit trees, razing hamlets and outlying farm buildings, once were prosperous cities; among them Lens, twelve miles north of Arras by rail and some eighteen miles southwest of Lille, the centre of one of the richest coal regions of northern France (Pas-de-Calais). It is surrounded by 200 square miles of coal-fields which, prior to the war, yielded annually 15,000,000 tons of fuel and which gave employment to 25,000 men. In addition, the city itself had numerous steel and iron foundries, engineering works, and steel cable manufactories. On the line between Arras and Lens is the village of Vimy, which gives its name to the famous ridge over which the contending armies have been fighting for nearly two years. To the northwest is Calais, seventy miles distant by rail. The Deule or Souchez River flows through the town; thereby, with the Lens Canal, affording water transportation northward into the Lys.

Situated on the canalized river Scarpe, 137 miles north of Paris and ninety-seven miles south of Brussels via the French Northern Railway, is Arras, the chief town of the department of Pas-de-Calais and before the war the most important grain market in northern France. Ami-

ens is thirty-eight miles by rail to the southwest. The surrounding territory is a fertile plain with the Vimy Ridge some six miles to the north. To the north and slightly east of Paris lies Cambrai, 121 miles distant by rail, via St. Quentin and Busigny, and 128 miles by way of St. Just, Chaulnes, and Peronne; it is twenty miles northeast of Arras. The importance to both belligerents of this town is due in large measure to the railways which radiate from it. A main line extends to Valenciennes, twenty-eight miles to the northeast; another passes through Caudry, a town of 11,000 inhabitants, and Busigny in a southwesterly direction to St. Quentin. A line goes to Le Cateau (sixteen miles) with important woolen and spinning mills, and another to Solesmes, a linen manufacturing town (thirteen miles). The lines of the western sector run southwest to Douai (sixteen miles), west to the village of Boisleux, a station on the important Arras-Amiens railway line, and south to St. Quentin on the Somme, and to Chaulnes, branching east and west at Roisel.

Directly east of the Vimy Ridge and fifteen miles by rail northeast of Arras lies Douai, which at the outbreak of the war had a population of nearly 40,000, engaged in thriving industries. One of its most important establishments was a large cannon factory. Glass and chemicals, ropes, farm implements, soap, and leather were also manufactured here, while the Scarpe Canal afforded cheap water transportation for an extensive trade in grain, agricultural products, and coal.

As far as possible from the danger zone of German air raiders is the American aviation school located at Toulon, one of the strongest fortresses in France and with Brest a leading base of the French navy. Less than sixty miles northeast of Toulon is St. Raphael, where the French have an aviation camp of their own.

**AREA AND POPULATION.** A complete list of the departments with their area and population according to the latest official figures is given in the 1916 YEAR BOOK. Also a list of the principal cities with their population over 30,000. The territory occupied by German troops at the end of the year included parts of the following departments: Nord, a department covering 5,773.73 sq. kilometres and having a pre-war population of 1,961,780; Aisne, 7,428.35 sq. kilometres and 530,226 inhabitants; Ardennes, 5,252.59 and 318,896; Meuse, 6240.57 and 277,955; Meurthe et Moselle, 5279.56 and 564,730; Vosges, 5903.03 and 433,914; Marne, 8205.31 and 436,310; Pas de Calais, 6751.56 and 1,068,155. An estimate purporting to be authoritative reports that approximately 15,501 square miles were at one time held by the Germans, or approximately seven and one-half per cent of the total area of France; that approximately 6535 square miles are now under German domination, or three per cent of the area of France. In other words, more than fifty-seven per cent of the French territory which was held by the Germans before the battle of the Marne has been recovered. France covers altogether 536,463.74 sq. kilometres and had a pre-war population of 39,601,509 inhabitants. Paris, the capital, had 2,888,110 inhabitants.

Births and deaths are given for 76 departments only in 1915 at 382,466 and 646,301 re-

spectively; for 1914, at 594,222 and 647,549; 1913, 745,539 and 703,638; 1910, 774,390 and 702,972.

**PRODUCTION AND SUPPLIES.** According to a statement by the French minister of supply, the 1917 harvest in France was the worst in fifty years. This was due in part to the exceptionally severe weather the previous winter, which did great damage to autumn sown crops, and even more largely to the disastrous spring. Almost to the end of April continuous snow and frost prevented any adequate work from being done in the fields, and the consequent rush that came in the succeeding few weeks could not be coped with by the laborers and their women folk still left on the land. Using the production of 1913 as a basis, the 1917 wheat crop was short 53.3 per cent.; the potato crop short 33.1 per cent.; the sugar beet crop short 67.9 per cent. Discussing the shortage of labor, the minister of supply says: "Last year a slightly better season pulled the figures up somewhat, but the case is only too apparently one of deficiency in labor. Proportionately the recruitment of the French army is much more largely from the land than in Great Britain, where the industrial centres, both under the volunteer system and the new service acts, have provided the bulk of the men for the army. Actually it is estimated by the Ministry of Agriculture that 8,000,000 people of both sexes—a fifth of the population—are employed on the land in France, and from their number at the time of the mobilization in 1914 3,000,000 of the best were taken. During the three years since that date the remnant, old men, unfit men, women, and children, have had to carry on the work of the second line of national defense. They have worked heroically."

The food supply was definitely organized in October, 1915. The law of October 16, 1915, intrusted to this service the arrangement for wheat and flour supplies for the civilian population, and placed at its disposal a credit of 120,000,000 francs as working capital. A statement of profit and loss must be supplied to the finance minister. The first, after about a year's transactions, showed a loss of 142,156,000 francs, to which amount should be added customs, duties, and registration fees paid by the service, together with the sundry charges incurred by receiving agencies, etc. At a later date, the loss increased from 142,000,000 to about 400,000,000; to which again should be added 229,000,000 customs, duties, and registration fees, with agency charges. The payments have now reached an amount approximating 1,717,000 and the receipts have been about 869,000,000, leaving a deficiency of 848,000,000 francs. This deficiency was not unexpected by parliament, where it was known that in creating the food supply service serious loss was likely.

In the winter of 1916 coal rose to the exorbitant price of £10 a ton, and even at that price, when the Seine was frozen, it was difficult to get. In 1917 every household was provided with a coal card and though the amount supplied was far from adequate it might with the aid of wood be made to eke the winter out. Bread cards, giving an allowance of one pound per day per person, were issued, while the quality had improved. The third card-controlled item, sugar, was reduced in allowance from 750 grams to 500 grams (about 17 ounces) per month, a

reduction which the food minister stated would mean a saving of 150,000 tons, and a consequent available shipping space for 5,000,000 bushels of wheat. See **FOOD CONTROL.**

By the law of October 16, 1915, requisition price must not exceed 30 fra. per 100 kilogrammes for wheat weighing 77 kg. per hectolitre and containing not more than 2 per cent extraneous matter. The farmer was not at liberty to charge more than 29 fr. for black or gray oats, and 29 fr. for white oats. By law enacted July 29, 1916, taking effect August 1, for the period of the war, and during the year following general demobilization, the farmer was not at liberty to charge more than 33 francs per quintal for wheat, whether sold or requisitioned. To this price the farmer might add 1 fr. 50 cost of transport and cartage to mills, etc. By decree dated January 16, 1917, the maximum price for all descriptions of barley of good quality, weighing at least 60 kilos per hectolitre, and containing not more than 2 per cent of extraneous matter, must not exceed 31 francs per quintal at the farm. The maximum price for all descriptions of rye of good quality must not exceed 30 francs per quintal at the farm. According to a decree of April 8, 1917, wheat reported previously to April 25, 1917, would be taken over by the administration at 36 fr. per 100 kgs. To this price may be added 1 fr. 50 for charges incurred.

In December, 1916, a measure was passed authorizing the cultivation, for the duration of the war and for a further period following the end of hostilities, of all unused lands with motor tractors. A paragraph of the law authorized the Ministry of Agriculture to purchase at home or abroad all machinery and implements required to enable an extensive cultivation of the soil; a credit of 30,000,000 francs was voted to carry out the project. Buyers of tractors were to receive a subvention from the departmental authorities equal to one-third of the purchase price. The scarcity of fertilizing materials, particularly phosphates and chemical fertilizers, was an unfavorable factor in the agricultural situation. This was due mainly to transportation difficulties. The phosphate production of the North African mines was reduced by labor shortage.

The Food Ministry decided that after February 19, maximum prices should be fixed throughout France for milk, butter, and cheese. In the department of the Seine, including Paris, the price of milk must not exceed 10 cents for a litre (about a pint and three-quarters) if bought in a shop, or 11 cents if delivered. The maximum prices for butter vary from \$1.12 to \$1.34 per kilo (roughly two pounds), according to the quality and source. The only cheese prices fixed so far were Camembert, from 13 cents to 26 cents the small box, according to quality, and Pont l'Eveque at slightly higher prices. All prices must be conspicuously displayed in the shops concerned.

The following table gives area in hectares and yield in quintals of main crops for 1917 (provisional), 1916 (final), and for the 5-year average 1911-15. The data for 1917 and 1916 do not include the territory occupied by the enemy. In order to render the five-year averages comparable with the other data, we have calculated these after taking into account the area at present invaded and the average yield of that area.

Hectares	1917	1916	1911-15
Wheat .....	4,224,450	5,030,080	5,918,374

§ Kilograms of cocoons.

The total area covered by olive plantations was estimated at about 296,525 acres. The bounty granted by the government to olive growers in 1916 was fixed at the rate of 14 francs per hectare. It was reported that the 1916-17 olive crop would be much below the average of the preceding 10 years.

The French production of almonds also decreased materially during the last 10 years. It appears, however, that the 1916 crop was somewhat in excess of that of 1915, which amounted to 3008 metric tons. The principal centre of the almond trade was at Aix-en-Provence, which handles, in addition to the local crop, large quantities of almonds from various Mediterranean countries, mainly from Spain and French northern Africa. The trade in almonds at Aix averaged about \$4,000,000 annually.

The quantities of wine delivered from the growers' premises since the beginning of the season on October 1, 1916, until June 30, 1917, were 23,754,833 hectolitres in France, and 6,688,475 hectolitres in Algeria. The stock in trade held by wholesale dealers on June 30 was 7,345,142 hectolitres in France, and 438,296 hectolitres in Algeria. The corresponding figures for deliveries during the same period in the previous year were, respectively, 18,073,821 and 4,778,919 hectolitres. Those of stock in trade were 8,478,540 and 216,350 hectolitres.

During 1916 the consumption of coffee in France was estimated at 2,400,000 bags. Stocks in bonded warehouses in the three principal ports on December 31, 1916, were 2,957,000 bags (each of 60 kilos), and at Bordeaux 70,000 bags. The total stocks on December 31, 1913, amounted to only 2,896,000 bags, of which 2,704,000 were at Havre, 148,000 at Marseilles, and 46,000 at Bordeaux.

The number of cattle declined in the past five years 16.5 per cent; the number of sheep, 36.6 per cent; the number of hogs, 40.2 per cent. A table follows showing live stock on farms July 1, 1917 and 1916, and December, 1913:

	1917	1916	1913	Difference
Horses ..	2,282,560	2,281,415	3,222,080	+ 1,145
Asses ..	324,580	329,459	356,310	+ 4,879
Mules ..	150,115	150,069	188,250	- 48
Cattle ..	12,443,304	12,728,946	14,787,710	- 280,642
Sheep ..	10,586,594	12,079,211	16,131,890	- 1,492,617
Pigs ...	4,200,280	4,448,366	7,035,850	- 248,086

Of the horses enumerated July 1, 1917, 1,721,970 were over and 560,590 were under three years (July 1, 1915, 1,562,742 and 664,467); of the cattle, 6,238,690 were cows (6,346,496), 1,295,120 oxen (1,262,315), 214,764 bulls (211,343), 2,677,870 young stock (2,581,870), and 2,016,860 calves (1,884,825). Of the sheep, 6,463,720 were ewes over one year (8,033,886), 1,139,320 sheep over one year (1,572,236), 188,204 rams (239,832), 2,795,350 lambs (3,637,235); pigs under six months numbered 2,245,310; fat stock over six months, 1,300,840; breeding sows, 628,040.

In the course of the sitting of September 20 at the Chamber of Deputies, the minister of agriculture observed that pre-war statistics dealt with the whole area of France, while the present data refer only to uninvaded territory; he went on to say that the figures were nevertheless comparable, since on the conclusion of peace the requirements of the whole country would have to be met by the supplies mentioned as available in 1917. See article AGRICULTURE.

**THE INDUSTRIAL SITUATION.** At the outbreak of war in August, 1914, a great demoralization of industry took place, shown by the fact that the number of establishments in operation dropped 50 per cent and the number of workmen employed (in establishments for which statistics are available) decreased from 1,637,166 to 534,387. Part of this decrease was due to the mobilization of the army, which withdrew an average of 24 per cent of the labor force. Among those which suffered the most were the textile, wood-working, building, and metal industries. Subsequently there was a steady recovery, both in number of establishments in operation and of workers employed, in practically every branch of industry in unoccupied territory. Naturally those industries directly contributing to the conduct of the war (the iron and steel, chemical, and food-producing industries) show the most considerable increase. In the invaded regions of northern France, Germany was using the sequestration rights allowed by international law for systematic pillaging and plundering. Sequestrators in Germany supplanted the proprietors of French business establishments and house property. Large firms in the metal industries whose capital was mostly French found themselves compelled to submit to the authority of German administrators, who dismissed all the managers and foremen and were running the business at a loss, whereas the returns of the year before the war showed in one such concern a clear profit of 740,000 marks.

In contrast to this German method of sequestration, sequestration of German property by the French was exercised with justice and in many instances plants sequestered were operated at a profit to the investors.

No statistics are available for the output of the coal mines of the Pas-de-Calais since the war began. Up to that time the annual production of these mines averaged 25,000,000 tons. At least half of them are now in invaded territory and the remainder have been taken over by the military authorities. In December, 1916, soft coal was selling at \$15 per ton and French anthracite at about \$20 per ton, against \$6 and \$10, respectively, in normal times. British anthracite was imported to supply the deficiency due to an increased demand and sold for \$30

per ton at the close of 1916. The tanning industry was devoted exclusively during 1916 to government work, except for the authorized sale of rejected material to private buyers, who bought at extraordinarily high prices.

The increased charges for freight, insurance, and war risk made the cost of cotton very high; but the French mills continued to do a large business, and it is generally reported that the spinning and weaving industries as a whole had a most successful season, notwithstanding the high cost of raw material.

There were in Marseilles 43 flour mills, with a daily grinding capacity of 1560 metric tons; 25 semolina factories, with a daily consumption capacity of 661 metric tons of raw wheat; a large number of macaroni factories. In normal years the products manufactured by these establishments were exported in large quantities and shipped to various sections of France. During 1916 the output of these industries entered almost entirely into domestic consumption; it was below normal in the case of flour mills and semolina factories, owing to difficulties in obtaining sufficient quantities of raw materials.

Three of the leading sugar refineries are established in Marseilles. Their total average output is about 146,000 metric tons annually, about two-thirds of which is usually exported, mainly to Morocco and other Mediterranean countries. These establishments worked to their full capacity during 1916.

**COMMERCE.** It is a well recognized fact that the trade and industry of a belligerent country are largely regulated by its status as victor or vanquished. After the Franco-Prussian War, French trade took several years to recover from the paralyzing effect of the nine months' siege of Paris. In Germany, on the contrary, there was a great increase in industrial activity, and foreign trade prospered to a marked degree. In the present war Germany has been practically isolated, while the French ports have remained open.

The value of French foreign trade during 1916, not including gold and silver coin, bullion, and the baser coinage, according to the official provisional statistics, was 20,275,102,000 francs as compared with 14,973,163,000 francs in 1915; an increase of 5,301,939,000 francs. The value of the imports was 15,159,412,000 francs, against 11,035,794,000 francs in 1915, an increase of 4,123,618,000 francs, or 37 per cent; and the value of the exports was 5,115,690,000 francs, as compared with 3,937,369,000 francs, an increase of 1,178,321,000 francs, or over 29 per cent. The imports of gold and silver coin and bullion and of the baser coins in 1916 were valued at 146,341,000 francs, against 126,886,000 francs in 1915, an increase of 19,455,000 francs; and the value of the exports during the past two years was 34,643,000 francs and 150,823,000 francs respectively. The imports of gold coin and bullion increased from 38,268,000 francs in 1915 to 57,288,000 francs in 1916; the exports during 1916 were 630,000 francs, as compared with 115,242,000 francs in 1915. The imports and exports of silver coin and bullion in 1916 were 89,029,000 francs and 33,638,000 francs respectively, as compared with 88,607,000 francs and 35,556,000 francs, respectively, in 1915.

Imports for four years are given below by great classes (special trade), value in thousands

of francs (A—foodstuffs, B—raw materials, C—manufactured articles):

Imports	1912	1913	1915	1916
A .....	1,803,400	1,916,500	3,814,797	4,076,052
B .....	4,813,200	4,941,600	4,653,404	6,452,320
C .....	1,614,200	1,650,800	3,067,593	4,631,040
Total..	8,280,800	8,508,400	11,085,794	15,159,412

Exports appear in the following table, by great classes as above, with the addition of D (by parcel post), values in thousands of francs:

Exports	1912	1913	1915	1916
A .....	849,800	833,200	648,953	488,262
B .....	1,944,900	1,882,700	767,521	801,090
C .....	3,917,900	4,159,500	2,341,817	3,587,024
D .....	.....	.....	179,578	244,314
Total..	6,712,600	6,875,400	3,937,869	5,115,690

The above totals for 1916 were computed on the basis of the average 1915 prices and are therefore less than the actual figures. As it was officially stated that no exact coefficient of increase could be given at the time of publication of the 1916 statistics, the approximately true figures of the foreign trade of France during the report year can not be computed.

As shown by the foregoing tables, the balance of trade against France during 1916 was 10,043,722,000 francs. Food purchases abroad in 1916 amounted to 4,076,052,000 francs, and the foreign sales were 483,262,000 francs, a difference of 3,592,790,000 or nearly 100 francs per capita of population. Wheat, with other cereals and flour, leads in food imports with the value of 1,694,361,000 francs. In 1908, the year of good crops, the import of cereals were only 201,286,000 francs. Next comes meat with imports of 564,589,000 francs; in 1913 the value was only 38,679,000 francs. The imports of wine in 1916 were 332,815,000 francs and brandy for drinking purposes 30,806,000 francs, a total of 363,621,000 francs. Of the wine imports, Algeria sent 183,015,000 francs, as compared with 321,495,000 out of a total importation of 343,523,000 in 1915. Coffee imports were 289,178,000 francs; sugar, 413,178,000 francs (only 34,302,000 francs in 1913); and cocoa, 99,281,000 francs.

The value of the imports of raw or half-finished material for the industries in 1916 was 6,452,320,000 francs. The principal items were: Iron and steel, 1,216,501,000 francs; other metals, 630,074,000 francs; coal, 1,142,839,000; cotton, 425,444,000; wool, 315,842,000; silk, 218,696,000; oleaginous seeds and fruits, 342,033,000; crude and refined petroleum, 284,091,000; and horses, 275,885,000. More than two-thirds or 3,587,024,000 francs of the exports were manufactured products. Of the imports in 1916 the value of manufactured products was 4,631,040,000 francs, the principal classes being machinery, 687,035,000 francs; wool tissues, 613,326,000 (50,603,000 francs in 1913); cotton tissues, 282,332,000 (56,474,000 in 1913); tools and metal work, 392,707,000, and chemical products, 332,728,000.

The foreign shipments of manufactured articles from France in 1916, were, with the exception of those during 1913, the largest for the past ten years. The great majority of articles mentioned in the list of French exports showed

an increase during 1916, except those upon which embargoes were placed. The United States was France's best customer for cotton goods, feathers, raw hides, perfumery, and soap, pottery, glass and crystal, seeds for sowing, and table fruits; Great Britain for chemicals, flowers, leaves and artificial fruits, prepared skins, imitation jewelry, leather goods, lingerie, and wearing apparel, milk, butter and cheese, paper and paper goods, Parisian novelties, manufactures of silk, manufactures of wool, and wines; and Italy for colors and inks, machinery, tools, and metal work, real jewelry, rubber goods, raw silk, and raw wool.

In the imports into France the United States leads in automobiles and other vehicles, cereals, copper, raw cotton, horses, machinery, salted and otherwise prepared meats, petroleum, tobacco, and ordinary wood. Great Britain made the largest shipments of coal, manufactures of cotton, prepared and raw skins and hides, tools and metal work, lingerie and wearing apparel, crude and manufactured rubber, tin, and silk and woolen textiles. Italy sent raw silk and Argentina fresh and refrigerated meats, exotic wood, and raw wool.

Countries of origin and destination, special commerce, values in thousands of francs:

During 1916, 6150 French vessels of 5,626,301 tons with cargo arrived in French ports, as compared with 6628 vessels of 6,207,816 tons during 1915 and 6886 vessels of 7,277,362 tons during 1914. During the same years the arrivals of vessels of other nationalities were as follows: In 1916, 26,259 vessels of 20,439,370 net tons; in 1915, 20,574 of 17,745,086 tons; and in 1914, 17,062 of 20,319,964 tons. Total vessels of all nationalities arriving in French ports, 32,409 of 26,065,671 net tons in 1916, against 27,202 of 23,952,902 tons in 1915 and 23,948 of 27,597,326 tons in 1914.

**FINANCE.** The monetary unit is the franc,

par value 19.295 cents. Below are given the average monthly rates of exchange for sight sterling and the demand rates for the American dollar during 1916, with the highest and lowest rates for each month (A equals high, B equals low, C equals average):

One of the problems of 1916 was that of the foreign exchanges on account of the material excess of imports over exports. Although every effort was made to develop the resources of the country, there was an unfavorable balance of trade. On the Bank of France to a large extent fell the burden of covering this balance in conjunction with the government, and at the end of 1916 the sterling and dollar exchanges were substantially the same as at the beginning of the year, and none of the other exchanges, with the exception of the Spanish, was much lower.

The antebellum national expenditure was 5,191,000,000 francs, and then there was a budget deficit. Next year's civil expenditure is estimated at 7,808,000,000 francs. Towards this total the existing revenue will supply 6,542,000,000 francs and new taxation will product 1,266,000,000 francs. During 1915 and to the end of October, 1916, the national treasury received 81,300,000,000 francs, whereof taxes produced 12,900,000,000 francs and loans 68,400,000,000 francs.

Russian loans are a source of anxiety. Since the visit of Nicholas II to Paris in 1896 to cement the Russo-French alliance, loan after loan has been floated on the Paris Bourse always with a fair measure of success. The aggregate Russian state indebtedness to French investors is probably somewhat in excess of fifteen billion francs, to which must be added the French advances made to the czar's government since the beginning of the war, amounting probably to another three billion francs.

Revenue and expenditure are given below in francs for three years (1915 budget estimate).

	1910	1911	1915
Revenue ..	4,278,890,789	4,689,045,845	3,883,971,126
Expend. ..	4,321,918,609	4,547,915,741	21,961,462,479

A comparative table for 1915 and 1916, showing details of the budget for those years, is given below; amounts are in francs:

At the beginning of 1916 the greatest gold reserve in Europe was held by France. The official report of the annual meeting of the Bank of France, held January 25, was given in United States newspapers of March 7. Extracts follow:

In spite of the lack of labor a further restriction of our agricultural production has been avoided. This has been effected by the double efforts on the part of the courageous rural population on the one hand and by improved processes of cultivation on the other.

In the mining industry the growing demand for coal and steel has led not only to an increased working of existing mines but to the opening of further deposits, notably in the western districts, rich in iron ores. In Savoy, Dauphiny, and the central Pyrénées, numerous factories have been erected with the use of hydro-electric power for metallurgical and chemical processes. Army orders are furnishing these two classes of undertaking with opportunities for successful operations. General progress is shown in the continued increase in the gross railway receipts and in the resumption of transactions based on credit. Thus the tax stamp on commercial paper produced in 1916 an 80 per cent increase over the receipts for 1915. The impression gained from these figures is confirmed by the increase in the discount business. At the end of 1915 holdings of unmautured paper amounted to 94,000,000 francs, but at the end of 1916 this figure had grown to 594,000,000 francs. The average of the two years rose from 266,000,000 francs to 447,000,000 francs. The growth of regular discount business has been accompanied by a fresh diminution of nearly half a billion francs in funds affected by the moratorium. This is a further indication of the gradual reestablishment of the circulation of capital. The financial market has shared equally in the improvement. Although the Bourse is still closed to operations for the account, the quotations of most of the stocks have strengthened. This has permitted the advantageous liquidation of contracts entered into prior to the war.

In announcing last year the opening of a

credit of \$20,000,000 under the auspices of the Bank of France, by a group of banks and trust companies of New York, in favor of a group of French establishments, the hope was expressed that the path thus opened would be largely used in future. This hope has been realized. Not only have Brown Bros. been ordered to renew this first credit, but several other operations, similar in form, have been conducted on behalf of French companies and undertakings forced to purchase in America their raw materials or their manufacturing machinery.

In spite of outgoings of gold, amounting since the beginning of the war to 1,057,000,000 francs, gold reserves at the end of the year were 5,082,000,000 francs, of which 3,489,000,000 francs were in the vaults of the bank and 1,593,000,000 francs on deposit abroad.

The capital of the debt stood, January 1, 1914, as follows: Finance ministry, 27,336,711 francs; instruction, 12,110,798; public works, 4,107,410,200; total general, 31,456,396,709; floating debt, 1,432,412,800; a total of 32,888,809,509. Total credits voted since the beginning of the war, 72,671,239 francs, of which 51,409,834,474 francs for defense. Floating debt, September 30, 1916, 18,890,567,000 francs; loans, 3,239,302,000; consolidated debt, 11,925,865,000; advanced by Bank of France and Bank of Algeria, 8,620,000,000.

Announcement was made March 20, by J. P. Morgan and Co., of the completion of arrangements for the issuance in the United States of \$100,000,000 of French government two-year 5½ per cent notes. The notes were to be offered at a price yielding somewhat more than 6 per cent. The French government had pledged securities having an aggregate value of \$120,000,000 of which \$20,000,000 consisted of American stocks and bonds and obligations of the Canadian Pacific Railway Company. The remainder was composed of bonds of neutral countries, Canadian provinces, the state of Berne, Switzerland, the city of Stockholm, bonds and shares of Spanish railway companies, and of the Suez Canal Company. See CANALS; FINANCIAL REVIEW; FLOOD PREVENTION; TAXATION.

RAILWAYS. Owing to the vast increase in the prices of necessary materials, especially coal and metallurgical products including engines, rails, and machinery, the operating expense of the French railways since the beginning of the war increased enormously. There were also increases in salaries and wages for employees beyond those received before the war, for pensions, and also increases due to various forms of social legislation. As a result extraordinary deficits were produced amounting in 1916 to 353.5 millions of francs and the estimates for 1917 based on the first four months of the year about 591,000,000 francs, or 247,000,000 more than in 1916. Consequently, the government and the various companies proposed an increase in rates as the deficits had to be provided for by the government in its annual budgets. The government bill proposed an increase of 15 per cent in transportation rates on the main lines and on the two Paris belt lines. Provision was also made for the distribution of the increased income and for future reduction of the rates after the close of the war. Throughout Europe, there had been, previous to 1917, a general increase in freight rates due to increased operating expenses, and there were economists in France who believed that even the proposed increase

would not be able to put the railways on a paying basis.

**GOVERNMENT.** Under the present constitution, the president is the executive, assisted by a cabinet responsible to the Chamber. The legislative power is vested in a parliament, or National Assembly, composed of a Senate and a Chamber of Deputies. The president, elected by the National Assembly by an absolute majority of votes for seven years, chooses his own cabinet; ordinarily, but not of necessity, selecting from among the members of the two chambers. The Senate is made up of 300 members aged not less than forty years, and elected by delegates for nine years; the Chamber of Deputies is made up of members elected by direct popular vote for four years, 1 to every 70,000 inhabitants. The president from 1913-20 is Raymond Poincaré. The members of the French Cabinet at the end of 1917 were as follows: Premier and Minister of War, Georges Clemenceau; Foreign Affairs, Stephen Pichon; Justice, Louis Nail; Interior, Jules Pams; Finance, Louis Klotz; Marine, Georges Leygues; Commerce, Etienne Clementel; Public Works, Albert Claveille; Munitions, Louis Loucheur; Instruction, Louis Lafferre; Colonies, Henry Simon; Labor, M. Colliard; Provisions, Victor Boret; Blockade and Invaded Region, Charles C. A. Jonnart.

Clemenceau, the veteran premier and minister of war (he is seventy-six), will have the assistance of three under-secretaries, chief of them being Senator Jules Jeanneney, whose title is chief of the general administration, and who has a seat in the Council of Ministers. Of the new cabinet, Clemenceau, Pichon, Jonnart, and Pams are senators, and two are not members of parliament (Claveille and Loucheur). The rest are deputies. Clementel, Claveille, and Loucheur were in the outgoing cabinet and retain the same portfolios. Clementel was Minister of Commerce in 1905 in the Rouvier Cabinet and has held that portfolio in three other cabinets, besides being Minister of Agriculture twice under Barthou and Finance Minister under Ribot in 1917.

Klotz was Finance Minister in the cabinets of Caillaux, Poincaré, and Briand (1910-11). Pams was Minister of Agriculture in the cabinets of Caillaux and Poincaré. Lafferre was Minister of Labor with Briand (1910). Leygues was Minister for the Colonies in the Sarrien Cabinet (1906). Boret is chairman of the Agricultural Committee of the Chamber of Deputies. Colliard represents a district of the department of the Rhône. Only one of the members of Clemenceau's new Cabinet was a member of his previous cabinet—Stephen Pichon, who had become prominent during the Morocco controversy and whom he made Foreign Minister, a post Pichon afterward held in the cabinets of Briand (1909-10) and Barthou (1914). In Clemenceau's first ministry, organized October 23, 1906, were Briand, Barthou, Viviani, Guyot-Dessaigne, Caillaux, Gen. Picquart, Thomson, Ruau, Millies-Lacroix, and Doumergue.

Politically interesting features in connection with the new cabinet are the abolition of the Ministry of Agriculture, which becomes an under-secretaryship under the Minister of Food Supply; and of the under-secretaryship of Fine Arts, deemed unnecessary in wartime. The Cabinet decided to appoint the following under-se-

cretaries of state: Interior, Albert Favre, an Independent Socialist deputy; Navy, Deputy Jules Cels, especially charged with submarine problems; Military Justice and Pensions, Deputy Edouard Ignace; Sanitary Department, Justin Godart, a deputy who is reappointed; Aviation, Jacques Dumesnil (reappointed); Merchant Marine, M. Lemery, deputy for Martinique. Deputy Durand having refused the post of Minister of Agriculture and that department having been attached to the Ministry of Food Supply, M. Villegrain was appointed under-secretary, especially charged with general service connected with corn.

### HISTORY

**THE GREEK QUESTION IN JANUARY.** In January the Chamber held several secret sessions during which the entire policy on the Eastern Front was discussed, especially the affairs of Greece. The government's course in Greece had caused great dissatisfaction from the first and criticisms found their way into the press in spite of the strict censorship. It was characterized as weak and vacillating. Nevertheless, after the debate in the course of which in a speech that lasted six hours, M. Briand explained and justified the government's policy, the Chamber gave its approval and some of the speakers even said that a more aggressive policy in Greece would have been undesirable. The French press sustained this decision but among the people at large the opinion still held that the government had been unduly considerate of Constantine, and was seriously lacking in energy. There were also complaints that, in spite of the conference of the Allies at Rome, neither the English nor the Italians were taking the same share as the French in the expedition of Salonika. See GREECE, *History* and WAR OF THE NATIONS.

**CABINET CRISIS.** Opposition arose in Parliament to a measure framed by Gen. Lyautey requiring the reëxamination of men exempted from draft and the enrollment of priests in the fighting units. On March 14, in reply to an interpellation on the aviation service, Gen. Lyautey declared that while he was ready to give explanations, he believed they endangered the national defense even when given in secret session. This occasioned a storm of protests in the Chamber and the general at once resigned. Outside Parliament this caused much regret for Gen. Lyautey had the confidence of a large part of the public. He was subsequently sent to Morocco to continue his very successful work of organizing and pacifying the country. M. Briand, the premier, being unable to replace Gen. Lyautey, and finding great difficulties in the reconstruction of the ministry, placed his resignation in the hands of the president, who at first invited M. Deschanel to form a ministry, but upon the latter's refusal summoned M. Ribot, who on March 19 succeeded in forming a cabinet. He offered the portfolio of foreign affairs to M. Briand, who refused it, but six other members of the Briand cabinet accepted office in the new cabinet. The ministry was composed as follows: M. Alexander Ribot, Prime Minister and Foreign Affairs; M. René Viviani, Justice; M. Paul Painlevé, War; Admiral Lacaze, Marine; M. Albert Thomas, Munitions; M. Joseph Thierry, Finance; M. Louis J. Malvy,

Interior; M. Jules Steeg, Public Instruction; M. Georges Desplas, Public Works; M. Étienne Clémentel, Commerce; M. Fernand David, Agriculture; M. Maurice Viollette, Food and Supplies; M. Léon Bourgeois, Labor; M. André Maginot, Colonies. According to party affiliations, the ministry contained three Moderate Republicans, three Radicals, one Radical Socialist, three Independent Socialists, and one Unified Socialist.

The crisis seemed exclusively to have been a parliamentary one and not due to any pressure of public opinion. Power now passed to the conservative Republican group. M. Ribot, who was a representative of that group and one of the most distinguished of the older public men, was seventy-five years of age and had begun his career under the Second Empire, always advancing along the line of moderate radical views. He was foreign minister under De Freycinet, continuing to hold that post under Loubet, and he was for a short time prime minister on several occasions, 1892-93 and 1895, and had been finance minister since October 30, 1915. In 1914, a few months before the war, after the general elections, he was invited to form a ministry but Parliament refused to give it confidence even for a single day and it was known as the One-Day Government, being the first instance of that kind in the history of the Republic. The new premier announced his policy on March 21, pledging the government to fight until Alsace-Lorraine was regained. The Chamber voted approval by 440 and 59 abstentions; there were no negatives.

**THE COMING OF THE AMERICANS.** Upon the declaration of war by the United States the French president addressed a cordial letter to the president of the United States expressing the appreciation of the French people. There was a demonstration in Parliament on April 5, and this was followed by a display throughout Paris and other cities of the American flag. The local councils assembled in many cities and voted resolutions welcoming the Americans. A special day was fixed called the United States Day. The ceremonies began with the raising of the American Flag on the Eiffel Tower on the afternoon of April 22. The flag was saluted by twenty-one guns.

**CHINESE IMMIGRATION.** In the spring of 1917 it was estimated that the Chinese who had been exported from Tientsin for more than a year past numbered over 100,000. They consisted chiefly of skilled and partly skilled laborers and they had been sent from China at the rate of over 1000 a week. An equal or greater number came also from Indo-China. They were employed mainly in the munition factories and at about double the wages that they received in China which, however, was a very small amount since it was estimated that partially skilled laborers received in Chinese factories not more than 12½ cents a day.

**NEW COMMERCIAL POLICY.** Early in the summer the French government announced to the cabinets of the Allied and neutral countries that it intended to denounce all the treaties of commerce and navigation and all clauses in the other treaties that could in future restrict its liberty of action in the pursuit of its economic policy. This course was taken as the first step in carrying out after the war the entirely new policy upon which the governments had resolved.

By it France broke completely with the past. The argument for putting an end to the most favored nation clause was that it made it absolutely impossible for France and England to resist German trade aggressions because it deprived those two countries of the means of discriminating against Germany. The latter power, it was said, had managed to escape the inconvenience of the most favored nation clause by interpreting it according to "specifications" of a very minute character and the United States had arrived at the same result by another method, requiring that any one wishing to obtain the most favored nation treatment must render a fair equivalent. The French policy had broken down even before the war.

**THE STOCKHOLM QUESTION.** The Socialist Congress which closed its sessions on May 28 saw a bitter debate on the Stockholm question but in the end the decision was in favor of sending delegates to Stockholm to define the war aims and to prepare for a full meeting of the International, in which German Socialists would probably take part. Thus the efforts of the small group which favored the old international ideals were at length successful. This minority ever since the declaration of war had struggled for the resumption of international relations even with the German Socialists. They had made some headway before the Russian revolution but they were still in a minority. The Russian revolution carried them on to success. The change of views on the part of the majority, which accepted finally the Stockholm proposal, was explained by saying that events had entirely altered the situation. The Russian revolution had severed France as well as Russia from an imperialistic policy. While the majority of the Socialists had been strongly on the side of the Entente Allies they felt some alarm at certain ambitions, especially those which the Russian aristocracy cherished and which might embark the Allies on a course of aggression. The majority were not hopeful, however, of any very important result from an international meeting of Socialists during the war. Some of them held that the only way of shortening the war was by a German revolution.

Outside Socialist circles there was much opposition to the presence of French delegates at a conference which German representatives would attend. The government decided against it. On June 6 the question of giving passports to Socialists for Stockholm was discussed in the Senate and after a speech by M. Ribot in which he said that France ought not to enter into any discussion with her enemies and that it was not time for any talk of peace, the Senate voted confidence unanimously. For this attitude, the government was sharply criticized in certain quarters. On June 1, during a noteworthy session, the Prime Minister had replied to these criticisms saying that if there was to be a peace it must be a peace made by the whole of France and not by any single party; that to authorize this Socialist delegation was to endanger the stability of opinion among the people and in the army; that patriotic Socialists themselves, such as Vandervelde, were opposed to it; that it would weaken the responsibility of the government; and that it was not the time for such an adventure. He went on to deny that the attitude of Russian socialism in general was hostile to the war, because of the dis-

covery of certain secret treaties that had been made between the French Republic and the czar. He characterized as infamous the report that previous to the war there had been agreements between France and Russia of an aggressive character and he declared his intention of publishing, with the consent of the Russian government, the text of the actual agreements. He caused a sensation by announcing that behind the strikes which had been disturbing public confidence in France there were forces working in the dark. Men whose identities were concealed were trying to cause the impression abroad that these strikes in France were leading to a revolution. He said that the government had taken and would continue to take all necessary measures to prevent such plots and that it would propose a bill to Parliament authorizing the punishment of second offenders who were shut out of Paris by the law establishing the state of siege but who nevertheless had come back because the law was accompanied by no penalty.

**ALSACE-LORRAINE.** On June 5 the long secret session of the Chamber of Deputies came to an end. It began after a debate had arisen on the subject of the government's refusal to give the Socialists passports for attending the international meeting at Stockholm. The debate soon involved questions of war aims and Franco-Russian diplomacy. The question of Alsace-Lorraine was also debated. The Chamber voted confidence in the government's determination to secure the restoration of Alsace-Lorraine and indemnity for the damage done there. In the resolution voting confidence the Chamber endorsed the protest of the Alsace-Lorraine Deputies in the National Assembly of 1871. These representatives had called upon France and the whole world to witness that they proclaimed their right to remain members of the French nation. The resolution declared that the invaded territories must be liberated, Alsace-Lorraine returned to France, and the damage done repaired. Its concluding terms were as follows: "Removed from all thought of conquest and of the enslavement of foreign peoples, the Chamber relies upon the efforts of the Armies of the Republic and of the Allied Armies to enable it—when Prussian militarism has been struck down—to obtain lasting guarantees of peace and independence for peoples great and small in the already prepared organization of a society of nations. It trusts that the government will obtain these results by the coordinated military and diplomatic action of all the Allies, and, rejecting all amendments, passes to the order of the day." Representatives of every group signed the resolution with the exception of the Unified Socialists, although some of them voted for it. The minority resolution, which was defeated, condemned secret diplomacy, and all policy of imperialism and conquest, and adopted the peace formula of the Russian government—no annexations or indemnities and the right of the peoples to dispose of themselves.

**DEBATE ON THE APRIL OFFENSIVE.** During the first week in July the Chamber held secret sessions for the discussion of the charges that the offensive of April 16 had been badly handled and had ended in defeat. The debate was closed in the public session of July 8 when the government, while admitting that mistakes had been made, declared that substantial gains had

resulted from the advance and that it was in effect a victory. It declared that the officers responsible for the mistakes, including Gen. Nivelle, had been relieved of their commands, and investigation was still going on for the purpose of fixing the responsibility. Gen. Nivelle had been replaced by Gen. Pétain on May 15, and at the same time Gen. Foch became chief of staff. In the course of the discussion the premier declared that the government would not permit a press campaign on behalf of Germany's terms of peace. These terms would be a dishonor to France and advocacy of them in the press would weaken the public morale. The sanitary department had also been criticized and was under discussion in the secret session. The government received a vote of confidence, 442 to 21.

**THE SUBMARINE PERIL.** France shared with her Allies the alarm over the grave danger from the submarine situation, though in certain quarters there was a tendency to make light of it. Public opinion was aroused after the torpedoing and sinking of the *Danton* on March 19 and an interesting discussion took place in the Chamber early in June when figures approved by the Admiralty were read by M. Cels, which made a profound impression upon the deputies. The main points were as follows: He showed that while the tonnage destroyed during the first three months of 1915 was 132,656 it soon rose to nearly three times, and after the middle of 1916, nearly four times, that figure. Then, during the last three months of 1916, it increased to the alarming figure of 926,617 and during the first three months of 1917, to about 1,300,000. Finally, in the month of April alone, the losses were 850,000. Thus the German submarines had sent to the bottom as large a number of merchant vessels as the entire merchant fleet of France at the beginning of the war. Then, as to the possible rate of construction, M. Cels declared that, in 1916, taking the highest credible figures, the construction was 1,783,000 tons, of which the Allies had not acquired more than 1,200,000. Assuming that the rate of construction has been 100,000 tons a month, one might safely conclude that so long as the submarine sank only 300,000 every three months the Allies remained masters of the situation; but the moment that the sinkings ran beyond that rate the situation became serious. Thus, down to the middle of 1916, the Allies were not in danger from this cause; but from that time on the danger had become increasingly serious. He added that on October 12, 1916, the two committees of war and merchant marine met after the sinking of the *Gallia* and appealed to the minister of the navy. The latter declared that he regretted the situation but could not help it. Moreover, M. Cels pointed out that Germany with her thirty million tons of steel and one hundred and sixty million tons of coal was independent of external aid for the carrying on of the war; and that while the blockade embarrassed her in the matter of food it really was not having a decisive effect upon the war.

After a long debate on the subject in the course of which there was sharp criticism of French measures of defense and especially of the lack of skill shown by the officers in meeting submarine attacks, the minister of marine, Admiral Lacaze, made a spirited reply. He said that it was impossible to praise highly

enough both the officers and the men, and that it was impossible to separate the officers from the men for they were equally deserving. As to the criticism of the navy, he said it was inexact and exaggerated; that the service had been greatly improved in the conduct of the submarine warfare, several new and efficient administrative organs having been created; that there was an official committee of investigation which passed under its survey all the incidents on sea; and that the number of submarines which had recently been sunk, especially in the month of May, was considerable. See SUBMARINE OPERATIONS.

**THE FALL OF THE RIBOT MINISTRY.** A cabinet council was held on September 7 and at the end of it the ministers handed in their resignations to the president of the Republic. On September 9 M. Ribot was charged with forming a new ministry, but having failed to do so he definitely resigned on September 10 and M. Painlevé succeeded on September 12. In the new ministry M. Ribot was made minister of foreign affairs. The chief reason for the fall of the cabinet was its inability to retain the support of the Socialists, but it had also been weakened by attacks on it for some time past on the ground of lack of vigor. Many believed that it did not show sufficient energy in dealing with disloyal and *défaitiste* propagandists. Various scandals, notably that of the *Bonnet Rouge* (see below) had begun to figure largely in the press, and M. Louis Malvy, minister of the interior, had been attacked on all sides for complicity in that affair and for too great leniency toward other enemies of the state. In order not to embarrass the government M. Malvy had resigned on August 31, protesting at the same time that the charges against him were calumnies circulated by a reactionary press. It seemed to be generally believed, however, that he had been either grossly imprudent or downright disloyal in associating with men engaged in treasonable or pacifist activities. M. Ribot's attempt to reconstitute a new ministry failed on account of the refusal of the Socialist group to take part in it. M. Painlevé, in insisting that M. Ribot should hold office in the new ministry, also alienated the Socialists, who refused absolutely to take any part in a ministry of which M. Ribot was a member. Meanwhile, M. Albert Thomas, the Socialist minister of munitions, resigned his office in order to avert a division in his party. Thus, for the first time since the beginning of the war, the government was without a single Socialist member. This was taken as a sign that the policy of the Sacred Union (*Union Sacrée*), whereby all party issues were to give way to the great aim of winning the war, was, so far as the Socialist group was concerned, definitely abandoned. Nevertheless, the Socialists promised to judge the new ministry by its deeds without regard to the fact that they were not represented in it.

The first step of the new ministry was to constitute itself into two committees: (1) A Committee of War, whose active members were the prime minister, who was also minister of war, the ministers of foreign affairs, the navy, and armament, respectively, and the four minister-secretaries of state; and (2) an Economic Committee, whose active members were the minister-secretary of state, M. Paul Doumer, president, and the ministers of commerce, agri-

culture, colonies, transportation, armament, and provisions, respectively. The total membership of the ministry was nineteen.

The leading idea in the minds of the majority during the ministerial crisis was the need of a thorough going campaign against those secret forces which had produced the recent scandals (see below). M. Clemenceau, in his newspaper, *L'Homme Enchaîné*, had been foremost among the journalists who attacked those scandals and demanded their suppression, and it was his denunciation of the conduct of M. Malvy that was chiefly responsible for the latter's downfall. M. Ribot's programme when he was trying to reconstitute the ministry had as its chief feature the punishment of crimes against the national defense and the determined search for the guilty parties. It was thought by many that M. Painlevé was more likely than his predecessor to carry this policy into vigorous effect. In his announcement of policy he assured the country that justice would be enforced against evil-doers without fear or hesitation.

**ATTITUDE OF THE FRENCH SOCIALISTS.** The great issue in the French Socialist party was between the national defense and the restoration of the old international socialism. This was one of the matters that were to come up at the national congress at Bordeaux on October 16. The French Unified Socialists comprised one-sixth of the entire Chamber of Deputies, and, owing to their vigor and discipline they had been more active than any other party in carrying out their programme. The national congress was to be a trial of strength between the two main sections of the party, that is to say, the division which placed the nation above everything else and the section which believed that the future of international social democracy was more important. M. Albert Thomas, former minister of munitions, outlined the situation as follows: When the war broke out the party was unified and it shared political responsibility in the cabinets of Viviani, Briand, and Ribot. The division between the majority and minority did not appear until the spring of 1915. At this time, that is to say, October 1, 1917, there were as many shades of difference between groups within the party as between groups of the Parliament itself. The Socialist party, according to M. Thomas, now had its Right, its Centre, and its Left. The minority Socialists had come forward in 1915 because, believing the war to have reached the stage of deadlock at the Front, they hoped to end the hostilities by other means; and the Russian revolution, together with the attitude of neutral Socialists, seemed to hold out a promise of success. They therefore bent all their energies to the restoration of the old International. During the summer and fall of 1917 the Centre which comprised majority and minority members directed the policy of the party. At the recent ministerial crisis the party refused its support to MM. Ribot and Painlevé for the reason that the war in their opinion required the young and energetic government of new men who would shake themselves free from party entanglements. They demanded a cabinet on the British model for the purpose of winning the war. The two main questions which were to come up before the Bordeaux congress were the Stockholm conference and Socialist participation in the government. The real question,

however, that overshadowed all others was to be that of peace. The groups represented by M. Thomas wished to bring the war to a victorious issue while at the same time insisting that absolute justice should be maintained by the Allies. Their idea was that no war can be really victorious which is not really democratic. The question then was whether the congress would decide for peace or for war.

As the year advanced it was evident that the Socialists came more and more under the influence of the element that had at first been in a minority, and they were offended by the government's refusal to grant passports for the Stockholm Conference. The debates on the Stockholm question in the summer and autumn brought out the fact that only a small group under MM. Guesde, Groussier, Bracke, and others were openly opposed to representation at the conference.

The Bordeaux congress rendered its decision as follows: The majority resolution decided for representation at Stockholm, the support of the war credits, and participation in the government, and urged the revision of the war aims of the Entente Allies. It was carried by 1552 votes. The minority voted a resolution to the same purport except that it imposed conditions on the voting of the war credits and on the participation of the Socialists in the government. The votes cast for it numbered 831. A resolution offered by M. Brizon, who represented the Kienthal section, demanded immediate peace. It received 385 votes. A still more extreme group numbering 118 voted against supporting the war credits. Abstentions numbered 85.

**FRENCH DIPLOMACY.** Some points were brought out in regard to the diplomacy of France during the war in the course of a debate in the Chamber on October 12, when a member made a long address in which he declared that a more energetic political and diplomatic course was necessary. He also asked the government to give the country more exact information as to current events in order to enable them to defend themselves against misrepresentations on the part of the enemy. In long wars, he said, history had shown that the political action was as important as the military, that it was the government as well as the army that led the people to victory or to defeat. After his address a Socialist deputy blamed the ministers for the mistakes of diplomacy during the war. He reproached them in particular for keeping the knowledge of actual conditions from the Chamber. He condemned secret diplomacy and demanded that diplomatic methods should be modernized. This brought M. Briand and M. Ribot to their feet in defense of their course as ministers of foreign affairs and in defense of the representatives of France abroad. The chief points in these addresses were as follows:

The diplomacy of France had been in marked contrast to that of Germany and its success was in equal contrast. As to modernizing diplomacy Germany had certainly done that and what had been the success of German modern methods? It had been everywhere compromised and discredited. It had been detected in all kinds of dishonorable operations and branded with shame. The result of German diplomacy was that Italy had come to the side of the Allies, then Japan, then Rumania, then the United

States, until, as M. Briand said, nearly all the countries of the world had joined against her. Now this, he declared, did not come about by accident. French diplomacy certainly had something to do with it. As to open diplomacy, while the words were attractive, they really meant nothing, for the moment a country should declare that its diplomacy would thenceforth cease to be secret the task before it would be easy indeed, for there would be no diplomacy at all. In the presence of dangerous and ruthless foes, it was necessary that French diplomacy should proceed with great prudence. Its success could be inferred from the high praise bestowed upon the French representatives in the United States and in neutral countries. Such men as MM. Cambon, Barrère, and Jusserand had nobly represented France and had been of the greatest service. M. Briand declared that in spite of the gains of Germany in one direction, it must not be forgotten that she was a nation besieged and cut off from all the rest of the world. She must depend on others for the means of living in the future. At the present turn of affairs, economic conditions were just as pressing as military. No matter how extensive a country's territories might be, if it were cut off from the rest of the world it must perish. Further advances on Germany's part in the war would result in cutting her off from the chance of securing the means of life in the future. In the economic field the Allies had an overwhelming superiority. Their victory was certain. The diplomatic representatives of France deserved full credit for the large share they had had in bringing this state of things about. M. Briand, however, agreed that at this time greater diplomatic and political activity on the part of the government was necessary. M. Ribot expressed the same opinions. He, too, believed that the economic situation on the part of Germany was most serious, pointing out that the countries which had joined against her were the very ones which down to that time had been supplying her with raw materials. Germany at the present time, he said, was trying to deceive the Allies. Austria had held out hopes of great concessions to France, thinking that she might turn Italy against France. Germany had let it be understood that if France would come to terms with her she would give back Alsace-Lorraine. France had not fallen into either of these traps. Then followed the announcement of the German government through von Kühlmann that Alsace-Lorraine would never be given up. This had the advantage of clearing up the situation. At present everything was definitely understood. France was fighting for victory and for Alsace-Lorraine. Germany had circulated the charge that it was France alone that prevented peace because of her insistence on the recovery of Alsace-Lorraine. Here again the trick was unsuccessful. British statesmen had declared the rightfulness of France's purpose, and the King of Italy had telegraphed that his country was wholly on the side of France. The Allies continued to be perfectly united. After the debate the Chamber passed a resolution to the effect that a vigorous, political direction in accordance with plans concerted with the Allies should be given to the war in the new phase upon which it was entering and that it was necessary to introduce promptly into the organization and methods of work in the

foreign office as well as in the choice of diplomatic and consular officers the reforms which the experience of the war had shown to be necessary.

Further points brought out as a result of the discussion of French diplomacy in Parliament and in the press were that the main difficulty was not so much in the sort of agents chosen as in the lack of initiative on the part of the government and Parliament. Germany, it was said, had often had the advantage of France in diplomacy despite the discredit which was attached to the German diplomats. This was attributed to the better organization of the German service. In criticizing the French service a deputy declared that men were often chosen for it who had not been engaged in any work that fitted them for their office. He also complained of the small number of commercial attachés and said that the salaries both of the diplomats and of the consuls were starvation wages. As a result, the agents were often ignorant of the most interesting parts of the country to which they were accredited. In general, the French diplomatic service was ably conducted, but in order to keep up the good qualities of its representatives it was necessary that the government should be on the alert. It should make a study of its representatives and their needs and it should seek to encourage their activities.

**CANADIAN FORESTERS.** According to a report published in November there were 10,000 professional Canadian foresters in France. The work already done had been of the greatest possible value. They had supplied the wood for bridges, plank roads, building, and wagon-making. They had gone about the work in a scientific manner, using the heavy timber for construction and the small trees for burning, and leaving sufficient growth for the future. In this work they were divided into companies of 175 men each. Each company lived in its own little village, had its shop and saw-mill, and employed 500 German prisoners. According to the report the work was done in the most economic and scientific manner possible.

**FALL OF THE PAINLEVÉ MINISTRY.** After a duration of only two months the Painlevé Cabinet was forced to resign as a result of an adverse vote on the government's proposal that an interpellation on the subject of the scandals should be deferred. The crisis was variously interpreted. In certain quarters it was regarded as a sign that the country was opposed to the attitude of the government toward peace. A debate in the Chamber on October 15 turned on the question of the aims of peace. Members of the ministry had declared that in addition to the return of Alsace-Lorraine to France certain territorial guarantees were required. These guarantees amounted to what was called a neutralization of German territory in the valley of the Sarre and the right bank of the Rhine. In the debate a deputy requested the government to state precisely its policy and to let the Chamber know whether it remained the same as before. M. Barthou declared that the governmental aims were already well known. Alsace-Lorraine had been invaded and must be returned to France. Guarantees were necessary. When he was asked what guarantees, he replied that it was impossible for the government at this time to determine them. It was too soon

to discuss theoretically the details of the terms. These terms had been discussed in secret committee and it had been a Socialist who had broached them in the committee. M. Renaudel, who had spoken of these territorial guarantees or neutralizations, said, however, that the force that was to carry them out was the society of nations. M. Barthou declared that it was obvious that right was not a sufficient support for a nation against Germany. Right had been on the side of Belgium, Serbia, and France, but it did not save those countries. Right at the present time, said he, was of value only so far as it was supported by the military; France and the claims of France could only triumph by a victory. The Socialist deputy, M. Thomas, thereupon interposed. He said that his party accepted the declaration of the government that France at the moment of victory would demand only her rights but his party was anxious to know whether the policy of the government now went any further than that. The Socialists did not depart from their previous view that all sacrifices should be made in order to insure victory; but supposing victory were complete and France could enforce her rights, would it enforce them according to principles of justice or by violence? When France had obtained the guarantees of the durable peace was she going to demand territorial guarantees, that is to say, annexations and conquests? That was the question in answer to which the Socialists wish the government to make a definite statement.

M. Painlevé replied that there was nothing uncertain in the ministerial declaration. He had already said that no consideration would prevent France from going to the limit of her rights. He had already said that the war would be carried on till victory was secured and a victory that would give France her rights. The results of victory could only be obtained by adopting the means that would bring victory. At the close of the discussion the vote of confidence was carried by 288 votes against 137. Thus the majority had diminished. Nevertheless, it could not be maintained that this was the true cause of the fall of the ministry. The crisis came about as a result of the scandals concerning which the government had not seen fit to make a frank declaration to the Chamber. Politically speaking, they were of secondary importance, but the rivalry of parties had taken advantage of them. As a matter of fact, it seemed that the Sacred Union had come to an end, for the contest between parties was growing more and more bitter, chiefly from the endeavors on the part of each group to be the successful competitor in working out a plan for peace.

The immediate occasion of the ministry's fall was as follows: On November 13, the question of the government's course in dealing with the cases of disloyalty and treason was debated and an interpellation on that subject was moved. M. Painlevé finally demanded that the interpellations be put off till November 30. This question was voted upon and the government lost by 186 to 277.

**THE SCANDALS.** The press abounded in direct charges or insinuations against persons of more or less prominence on the ground of disloyalty or treason. As the year advanced many arrests were made and portions of the evidence against the accused, together with their state-

ments on their own behalf, were made public, but no decision had been reached in any important case at the close of the year. The most notorious affairs that were at that time pending were as follows: The Malvy case, the affair of the *Bonnet Rouge*, of Bolo Pasha, Joseph Caillaux, Loustalot, Turmel, Humbert, Lenoir-Desouches, Paix-Séailles, and Leymarie. Of these, according to last accounts, Malvy, Caillaux, Loustalot, Humbert, and Turmel, who were members of parliament, were to be tried by the high court. The others were to be tried by court martial. Space is lacking for more than a bare outline of these affairs, which, moreover, were not important individually, but only as indicating when taken together a menace to the public morale. It was generally believed that these disloyal activities were increasing and that the government not only was culpably lax in dealing with them but that some of its members had been in dishonorable relations with the evil-doers. The indignation over these conditions was the chief factor in bringing into power M. Clemenceau, who had been for a long time back the chief assailant of *défaitiste* intrigue and ministerial complaisance.

The *Bonnet Rouge*, which was at first an apparently loyal paper and contained among its contributors many well known men whose patriotism was unquestioned, gradually assumed an attitude that aroused suspicion. In a veiled manner it conveyed impressions tending to the advantage of the enemy. It was thought to be subsidized by funds secretly derived from enemy sources. Its manager, M. Duval, whose frequent journeys to Switzerland in 1916 drew the attention of the police, was placed by them under surveillance in May, 1917, and soon afterwards, on his returning from one of these trips, they found in his possession a check for 125,000 francs, which they took from him and photographed. They then restored it to him, without notifying either the Ministry of War or the minister of the interior. For this negligence the responsible military official was reprimanded and M. Leymarie, chief of the Bureau of Public Safety, was obliged to resign. Meanwhile, the authorities began an investigation into M. Duval's financial errands in Switzerland and it was found that he had received large sums of money from German sources. He was charged at first with "commerce with the enemy" and later with the more serious crime of "intelligence with the enemy." The case was still under judgment at the close of the year. Meanwhile the editor of the *Bonnet Rouge*, one Almereyda, alias Vigo, was found to have received from Duval a check for 200,000 francs and was arrested on the charge of complicity with the latter's operations. The next step was the seizure of a chest of papers belonging to the *Bonnet Rouge*, which were thought to contain incriminating documents. Soon afterwards Almereyda was found dead in prison, with marks upon his throat indicating strangulation, which he had apparently achieved by means of a shoe-string attached to the foot of his bed. The circumstances were obscure; there had been gross negligence on the part of the prison officials, who were subsequently disciplined, and there was doubt whether he had killed himself, been murdered, or died a natural death. The three medical experts who reported on the cause of death decided in favor of suicide. M. Leymarie was arrested later

on the charge of intelligence with the enemy and his case was pending at the close of the year.

In the affair of M. Humbert, a member of the Senate, a newspaper of a very different character was involved, namely the *Journal*, which bore an excellent reputation. M. Humbert, the director, obtained the funds for its support from Bolo Pasha (see below), but, according to his own account, at a time when there was no reason to suspect the latter of being an enemy agent. When charges were brought against Bolo he immediately took steps to rid the paper of the latter's interest and he afterwards sold it to Lenoir-Desouches. Suit was brought against M. Humbert to ascertain whether in the transactions with Bolo and with Lenoir-Desouches he had been guilty of misconduct, and the Senate, with M. Humbert's approval, voted to suspend his parliamentary immunity. He resigned the directorship of the *Journal* on December 8. Lenoir and Desouches were also involved.

The affair of the deputy M. Turmel arose from the discovery in his locker at the parliamentary building of a check for 25,000 francs in regard to which his somewhat contradictory explanations aroused suspicions of commerce with the enemy. His parliamentary immunity was suspended and the case was pending at the close of the year. Another deputy, M. Loustalot, was under charges of intelligence with the enemy on account of his interviews in Switzerland with the ex-khedive of Egypt, Abbas Hilmi, reputed to be a German agent. M. Paix-Séailles was held on the charge of having revealed information likely to aid the enemy in the field. The three most conspicuous cases involving individuals, namely, those of M. Louis Malvy, Bolo Pasha, and M. Joseph Caillaux are outlined in the following paragraphs.

**THE MALVY CASE.** The charges against M. Malvy which had been made with more or less definiteness in the press for a long time past were brought to the notice of the Senate in an interpellation by M. Clemenceau on July 22. On October 4 a letter addressed to the premier by M. Léon Daudet, director of the *Action Française*, denouncing M. Malvy in unmeasured terms as a traitor to his country was read at M. Malvy's own request to the Chamber of Deputies. The government began an investigation and at the close of the cabinet council on October 16 M. Painlevé declared he had reached the conclusion that all charges were baseless. The judicial department was going ahead with the case and the government left it in entire independence but it seemed to be the duty of the government to declare its opinion that the charges were false. This apparent inconsistency in the matter of deciding the case in advance while leaving the courts free to pursue it aroused much criticism and brought forth the comment of M. Daudet in the *Action Française* that it was "stupefying." Early in November the authorities searched the residence of M. Malvy's former director, M. Leymarie, and seized a number of documents. Suit was brought against the latter for commerce with the enemy. On November 23, M. Malvy requested in the Chamber that a committee of thirty-three should examine the charges against him. The Chamber elected a committee of eleven to decide upon this question and it reported favorably. Thereupon the Chamber appointed the committee of thirty-

three. On November 29 this committee's report recommending that M. Malvy be placed on trial was submitted to the Chamber which approved it by a vote of 512 against 2. As there was no precedent for such a case a bill was introduced in the Senate to cover it. The specific charges made by M. Léon Daudet were that he had given diplomatic and military information to the enemy, especially in connection with the attack on *Chemin des Dames*. The case was to go before the high court. In the press attacks on M. Malvy he was accused of being on intimate terms with Almereyda, of relations with Bolo, and of tolerating or conniving at various intrigues against the national defense, in short of a policy of *laissez faire* toward dangerous elements in the state if not actual complicity with them. In his own defense he attributed these attacks to the machinations of his political enemies, pointed to the peace between the social classes and groups which had been maintained under his administration since the beginning of the war, declared his policy had been one of toleration and measure, and specifically denied having any relations with Almereyda or the *Bonnet Rouge* or Bolo Pasha from the time when their true character became known to him.

**THE AFFAIR OF BOLO PASHA.** Bolo Pasha was arrested on the charge of attempting to corrupt the French public by funds derived from German sources. The accused who had derived his title from the dethroned khedive had aroused suspicion by his frequent journeys to Switzerland, Italy, and Spain. He was watched by the special police, who found that in his various enterprises he had spent several million francs. Bolo's explanation was that long before the war he had made investments in America and that at the time of his arrest he was in possession of a fortune of seven million francs, all of which was deposited in American banks. He said he had never handled money either in Italy or in Switzerland. The police then caused inquiries to be made in Switzerland and in the United States. In the United States the authorities exerted themselves to the utmost and it was on the basis of the information which they sent to the French authorities that Bolo was arrested. The United States State Department addressed to the French foreign office a telegram to the effect that various sums of money exceeding in all two million dollars had been deposited in the course of 1916 in the name of Paul Bolo who was then in Paris, and that these deposits had been made by the Deutsche Bank of Berlin. A great part of this money had already been remitted to Paul Bolo by transfers on a French bank. Further evidence was accumulated after his imprisonment, and the case was on trial at the close of the year.

Some of the ramifications of the affair have been indicated in preceding paragraphs. M. Humbert, who, as noted above, had obtained money from Bolo in order to assume financial control of the *Journal*, said, when questioned on the subject, that he had inquired into Bolo's antecedents and found that they were good and that responsible people were willing to vouch for him. Among those who did so was M. Monier, first president of the Court of Cassation. M. Malvy had also appealed to M. Monier's endorsement of Bolo in defense of his own fail-

ure to suspect him. Upon the arrest of Bolo it was decided to summon M. Monier before the higher council of the magistracy to explain. Dissatisfied with his explanation, the council pronounced the sentence of dismissal from his office. This was the most severe penalty that could be imposed in a disciplinary suit of this nature. M. Monier, previous to the trial, had requested that he be allowed to retire in possession of his rights on the ground of ill-health, but as the rule prescribing this did not apply to cases where officers had been dismissed for cause his application was disregarded.

Bolo's relations with M. Caillaux formed also an element of suspicion in that affair, as noted below. See UNITED STATES AND THE WAR.

**THE CAILLAUX CASE.** In the summer of 1917 M. Joseph Caillaux made his appearance in the Chamber for the first time since the war began. Newspaper attacks on him which had been made from time to time for many months past now increased. Rumors of disloyal activities in Italy, association with pro-Germans, pacifists, and traitors, had long been circulated. The *London Times* accused him of intriguing in Italy on behalf of a German peace. This he publicly denied. Suspicion was heightened by the high praise bestowed upon him by the press of the Central Powers or of circles friendly to them. By French and English journalists he was charged with a campaign of German propaganda in France and elsewhere, including the support or encouragement of a chain of newspapers which in a veiled manner were working in the German interest. Among the papers mentioned were *Le Pays*, the *Agence Républicaine d'Informations*, *Les Nations*, and above all the *Bonnet Rouge*, and many others; and he was said to be more or less responsible for an association of these papers under the name of the Republican League which was designed to carry on a campaign in parliamentary circles. In the Allied press he was spoken of as the most sinister influence in French politics whose return to political power would be disastrous. For a long time M. Caillaux paid little attention to these attacks, treating them as the calumnies of his political enemies. For the most part he contented himself with an occasional sweeping denial. At Marnes in the summer he made a speech expressing irreproachably patriotic sentiments to his constituents. He and his friends subsequently referred to this speech as evidence of his loyalty. Nevertheless, attacks upon him, more or less open, continued in the press by which he was charged with being in relation with the treasonable and *défaitiste* elements in France and abroad. In November M. Gustave Hervé, editor of the *Victoire*, having published these accusations against him in his journal, M. Caillaux gave out an explicit denial. M. Hervé, however, repeated his charges, definitely accusing him of complicity in the Bolo affair and the affair of the *Bonnet Rouge*, and association with treasonable movements in France and Italy. He concluded with a challenge to M. Caillaux to bring suit against him on the charges of defamation. Soon afterwards M. Caillaux summoned him before the Court of Assize at Mons, in the department which M. Caillaux represented in Parliament. Meanwhile, the examining magistrate in the cases of alleged intelligence with the enemy called as a witness M.

Caillaux who had paid the sum of 36,000 francs during the trial of his wife for murder to the *Bonnet Rouge* and was said to have been in close relations with M. Almeyreda down to the time of the latter's death. In an announcement that he gave subsequently to the press he declared that since the outbreak of the war he had contributed no funds to that paper and had had nothing to do with its policy.

On December 11 a demand was made for the trial of M. Caillaux on the following charges preferred by Gen. Dubail: Friendship with Bolo and Almeyreda, in evidence of which letters were produced; relations with Signor Cavallini, now in prison in Italy on charges of disloyalty; plots while in Italy to bring about an alliance between France and Germany against Great Britain and to the detriment of the Entente Allies; complaints of his activities on the part of the diplomatic representatives of the Allies of France; in general evidence sufficient to justify the charge that since the beginning of the war he had attempted to hamper the military operations of the Entente Allies and promote the success of the enemy. One of the most important documents bearing on M. Caillaux's activities in Rome was given out at the close of the year 1917. It was a letter addressed on December 22, 1916, by the naval attaché at Rome to the chief of the general staff of the navy. He said that this letter written at the instance of the Ambassador declared that the following facts were known to the Ambassadors of Russia and Great Britain, to the Italian foreign minister, and to other authorities. On December 17, it declared, M. Caillaux made an appointment with the Italian cabinet minister, Signor Salandra. The latter avoided the interview but sent in his place Signor Martini, former minister for the colonies. M. Caillaux, in the course of his conversation with the Italian minister, referred slightly to M. Briand, whose ministry he said was doomed. There would follow, in his opinion, a ministry under M. Clemenceau which would not last long for it would be a war ministry and France could not continue her military effort after the spring. By that time, he said, he himself would come to power and would sign the peace which would certainly astonish the entire world by the advantages which Germany would concede to Italy and to France. The whole cost of the war would be paid by Russia and the Balkans. What Germany wished was the road to Bagdad, an enlarged Bulgaria, and an enlarged Turkey. That would be no injury to France for the French field of action was in Africa. Serbia and Rumania would disappear, but that would be no more than they deserved. As soon as the peace was signed, he said, France would conclude a treaty with Germany, Italy, and Spain against England and Russia which were her real enemies. The writer then went on to say that the Italian foreign minister would have expelled M. Caillaux from Italy and seized his papers if he had not feared that this course would be displeasing to the government of France. He waited only a sign from the French government to do so. The writer further charged M. Caillaux with conferences with the most pacifist of the prelates at the Vatican whom he urged to redouble their efforts for peace, saying that if Italy concluded a separate peace France would be obliged to abandon the strug-

gle; with promising that if he came to power he would renew diplomatic relations with the Holy See; also with having been in close relations with the editor of a pro-German newspaper in Naples.

A committee of eleven took up the question of suspending parliamentary immunity and on December 16 decided in favor of doing so. The removal of immunity was voted on December 22 by 392 to 2 (115 not voting). On the same day M. Caillaux made an address of two hours on his own behalf. The letters to Bolo and Almeyreda were, he declared, entirely innocent. His sole fault had been in yielding to his impulses and making acquaintances, and he could be blamed at most for a certain carelessness in this respect. Why should he be blamed for trusting Bolo, when so respectable an authority as M. Monier had vouched for him? As to the charges against him, while in Italy, they were the result merely of a quarrel with M. Barrère, the French Ambassador there. The essentials of the policy which he had advocated were as follows: No alliance with Germany so long as the question of Alsace-Lorraine remained unsettled in the interest of France; but the possibility of an accord with Germany on determined and limited points. He declared that he had supported every government since the beginning of the war. As to the charges against him, he declared his hands were clean. Machinations against him had succeeded merely because he was too contemptuous to pay attention to them. He demanded that his parliamentary immunity should be suspended in order that he might prove his innocence. At the close of the year he was confined in prison awaiting trial before the high court.

THE CLEMENCEAU MINISTRY. There was at first some uncertainty as to a successor but the majority favored M. Clemenceau, whose vigorous attacks on the enemies of the national defense marked him out as the man most likely to proceed with energy in the matter of the scandals. M. Clemenceau succeeded in forming a ministry on November 16. For its personnel see above under *Government*. The most important matters, of course, pertained to internal policy which, in the opinion of M. Clemenceau and his supporters, had hitherto been too timid. The previous government was blamed for having treated labor as if it were peace time and for having been afraid to take any action toward offenders among the laboring classes. This tenderness towards evil-doers in the supposed interest of public peace was marked by the relations between M. Malvy and Almeyreda and by the open preaching of disloyalty in the *Bonnet Rouge* which paper was even partly supported at the expense of the state. The same policy permitted the Bolo and similar scandals to exist including those intrigues by which the *Journal* fell under foreign influences. The ministerial declaration of policy implied that a much more rigid course would be taken henceforth. M. Clemenceau said that too many crimes had been paid for on the front by an increase in the bloodshed. All accused persons, he said, should be tried before court-martial. There were to be no more pacifist campaigns, no more German intrigues, and neither treason nor half treason. The vote of confidence in the government was 418 against 65.

At the end of the year M. Clemenceau, in his

attempt to promote efficiency in the administration of the war department, sent a circular letter to all the bureaux urging that business be dispatched effectively and quickly. He said the telephone or direct conversation should replace the roundabout system of sending documents for endorsement from one bureau to another when the persons concerned were near at hand. Correspondence should not be permitted to drag on in that manner when a conversation of two minutes would settle the point. After the conversation the memorandum should be made in writing but until a decision was reached there was no need of all this documentation. He said that he estimated that 80 per cent of the public business could be studied and settled rapidly and he therefore prescribed that in future all matters which did not require long investigation should be dealt within three days, including the time necessary for transmission.

See LABOR; PROSTITUTION.

**FRAWLEY LAW.** See BOXING.

**FRENCH ACADEMY.** See ACADEMY, FRENCH.

**FRENCH CONGO.** Now French Equatorial Africa (q.v.).

**FRENCH EQUATORIAL AFRICA** (formerly French Congo). A French possession in equatorial Africa, bounded on the northwest by the Kamerun, on the north by Wadai, one of the central Sudan states, on the east by the Bahr-el-Ghazal, on the southeast by the Belgian Congo, and on the west by the Atlantic. It is under the control of a governor-general, assisted by a council of government. It was in 1906 divided into three colonies—the Gabon Colony, capital Libreville (pop., 3000); the Middle Congo Colony, capital, Brazzaville; and the Ubangi-Shari-Chad Colony, capital, Bangui. The Middle Congo Colony has an administrator-in-chief; the other colonies have a lieutenant-governor, and all three have administrative councils. The military forces number about 4000. The colony entails a heavy burden on the French colonial budget. A railway has been laid from Brazzaville to Bangui and one from Bangui to Fort Lamy. From the old area of 669,280 square miles must be deducted roughly 170,270 square miles ceded under the convention of November 14, 1911, to Germany by France; and to it must be added about 6450 square miles ceded to France by Germany from the Kamerun. The area ceded to Germany carries a population of about 1,000,000 out of the original 10,000,000 (the estimated population in 1906). The exports include ivory, ebony and other woods, rubber, and palm nuts and oil.

**FRENCH ESTABLISHMENTS IN OCEANIA.** A French colony in the south Pacific, consisting of widely scattered groups and single islands. Area (estimated), 3998 square kilometres; population, 31,477. Capital, Papeete (3617 inhabitants), in Tahiti. The principal exports are copra and vanilla.

**FRENCH FOR SOLDIERS.** See PHILOLOGY, MODERN.

**FRENCH GUIANA (CAYENNE).** A French colony and penal settlement on the northern coast of South America. It covers 88,240 square kilometres (34,069 square miles) and had a population in 1911 of about 49,000. Cayenne, the chief town and only seaport, has about 13,500 inhabitants. Gold mining (placer) is the chief occupation of the people.

**FRENCH GUINEA.** A French West African colony. Capital, Konakry, with 6623 inhabitants; Kankan is the chief commercial centre. Other towns are Boké, Kindia, and Dubreka. The railway from Konakry to Kouroussa (588 kilometres) was completed and in operation January 1, 1911. A branch to Kankan was to have been completed in 1914. Transport from and into the interior is by caravan. Rubber is the principal export, and is gathered over all the colony; but the principal sources are the Futa-Jallon, the Farana region, and certain circles of Upper Guinea. Rice is grown, and grazing is widely practiced. The mineral resources are believed to be considerable. See FRENCH WEST AFRICA.

**FRENCH INDIA.** Five French dependencies in India, covering 513 square kilometres, with a population estimated (1915) at 266,828. The towns are Pondicherry (the capital), Karikal, Mahé, Chandernagor, and Yanaon. Chief exports, oil seeds, raw cotton, and pulse.

**FRENCH INDO-CHINA.** A dependency of France in southeastern Asia, made up of five states and a strip of territory leased from China, as follows: Annam, 159,890 sq. kilometres, with (1914) 5,200,000 inhabitants; Cambodia, 175,450 sq. kilometres, with 1,634,252; Cochin-China, 56,965 sq. kilometres, with 3,050,785; Laos, 290,000 sq. kilometres, with 640,877; Tongking, 119,750 sq. kilometres, with 6,119,720; Kwangchow-Wan (leased territory), 1000 sq. kilometres, with 168,000. Hanoi (in Tongking) is the capital, with 113,676 inhabitants; Cholon had 191,665; Bin-Dinh, 75,000; Saigon, 72,000; Pnom-Penh, 54,621; Hué, 65,000; Vien-tiane and Haiphong, each about 27,000.

Trade statistics are returned for the colony as a whole, and are given by a British authority at £6,483,784 imports and £15,449,568 exports for 1915. The general budget balanced for 1917 at 42,399,800 piastres. Debt, January 1, 1915, 345,913,000 francs.

The railway from Saigon to Mytho (the oldest railway in the country) is being extended to Cantho (60 miles). Other lines are the Haiphong-Laoki-Yunnanfu (291 miles), the line from Hanoi to the Chinese frontier (308), Tourane-Hué-Quang-tri and Tourane-Faifu (130), Saigon-Khat-Hoa-Langbian (183). The Yunnan Railway was completed in 1910.

**FRENCH LANGUAGE MANUALS.** See PHILOLOGY, MODERN.

**FRENCH LITERATURE.** When, after the first surprise of the war was over, after the victory of the Marne, men of letters took up their pens again, they expressed in a somewhat hasty manner their interpretation of the momentous world events—indignation at the treacherous attack, indignation at their own blindness because they allowed themselves to be deceived by Germany hypocrisy. The second year of the war, the market was flooded with the narratives of those at the front, soldiers of all ranks, and of people of all walks of life who had been dragged into the war directly or indirectly; also a great amount of lyric poetry reflected the courage and confidence of the French people. The third year—1917—while indeed diaries and poetry continued to form the bulk of the literary production, seemed to inaugurate an era of philosophical speculation, but of a calmer interpretation of events, and of interesting attempts to offer suggestions for the future.

Surely France does not refrain from acknowledging her mistakes in the past; not only do critics blame their government for its bureaucracy, for its neglect to make use of the splendid intelligence of their scholars for national prosperity, for the too conservative attitude of French financiers when it comes to investing the money of the French people; but also they reproach their writers of the past generation for their lack of substantial thought, for their sentimental socialism (Jaurès), for their fluid philosophy of intuition (Bergson), which together killed any attempt at really virile literature. See such vigorous books as J. Benda's *Sentiments de Critias* (arraignment of Bergsonism and Romain-Rollandism); R. Lote, *Les leçons intellectuelles de la guerre*; Sageret, *Guerre et Progrès*; Pawlowski, *Dans les rides du Front* (as delightfully witty as sharp); Ch. de Saint Cyr, *Oe qu'il faudra que soit la France de la Victoire* (answers from famous men). If one tries to define the chief constructive currents, two, so far, compel attention: One advocates with astonishing deliberation a return to something higher than mere national ambitions by way of the Catholic Church (the Pope being viewed not so much as he shows himself concretely to be in the person of Benedict XIII, but as ideally he ought to be if he were to represent the spiritual Catholicism of the world); see such books as Ch. Maurras, *Le pape, la guerre et la paix*, or, more mystical, H. Massis, *Le Sacrifice* (crowned by the Academy). The other current sees the future of France and of the world in a sound democratization of the nations. A little timid at the beginning, this current is growing bolder in expressing itself since America entered the war. (France did not believe that America would really enter the war.) See, besides Herriot's *Agir*, La Chapelle, *L'œuvre de demain*, and the neat, strong and concise Lysis, *Vers la Démocratie nouvelle*, and *Pour Renaitre*. Two works of philosophical literature we must mention because of the fame of the authors, although they are distinctly outside the general trend of thought, are Loti's *Quelques aspects du Vertige mondial* (out of date metaphysical considerations) and Maeterlinck, *L'Hôte inconnu*, which "hôte" is the mystery in life, occultism, telepathy, etc. (the book was published in English translation in London, as early as 1914).

So, as usual, in times of social unrest, the line between philosophy and literature is pretty well obliterated. This does not, however, prevent the production of literature along conventional lines. Let us mention the best, following our ordinary classification.

**THEATRE.** The greatest success of the year was Bernstein's *Élévation*—the theme (which, however, is already becoming alarmingly commonplace) is the man rescued from the depth of a low morality through the stern baptism of war, combined with the influence of a noble woman's love. Donnay's little play, *Le théâtre aux armées*, written for the soldiers and about soldiers, will not add much to the fame of the author. André Dumas wrote a delicate play, *L'Éternelle Présence*, for the Comédie Française which wanted to celebrate the anniversary of the battle of the Marne. Maurice de Croisset's *D'un jour à l'autre* is "marivaudage" around love and war episodes, while Porto Riche's *Marchand d'estampes* is a gruesome story of a sedate shop keeper in whom the war

awakes romanesque fancies which lead to a double suicide. Farrère and Népote wrote five acts on *La veille d'armes. Mon œuvre*, by Georges Berr and Verneil, a satire against women, who, perhaps quite unconsciously, pursue all sorts of ends under the veil of their war work, was regarded as untimely. Porché's *Les Butors et la Finette*—a purely allegorical play of the war (*Les Butors*—the Huns and *la Finette*—France)—was the last remarkable play of the year. Some plays ignored the war altogether, and seemed anachronisms; especially Sacha Guitry's *L'illusionniste*, which touches us no more than a tale of the moon. Géraudy's *Noce d'argent*, at the Comédie Française, is of the same nature; it had the excuse, however, of having been written before the war. Marcel l'Herbier published a play in the new Paul Claudel style, *L'enfantement du mort* (mediæval mystery style). R. Morax offers some original marionnette plays in his *Théâtre de Poupées*. The "reprises" were interesting as indicating the public demand. Corneille's *Polyeucte* pleased very much; then the austere classical plays seemed to have a message, too: Euripides's *Andromaque* and Sophocles's *Œdipe Roi* (Paul Mounet taking the part of his deceased brother). Verhaeren's *Le Cloître* was another success. Less so were Balzac's *Vautrin*; and especially Bataille's *Amazonne*, and Tr. Bernard's *La volonté de l'homme*—both plays showing how little "volonté" man has. A "Société Shakespeare" was founded, and Gémier gave a most interesting performance of *The Merchant of Venice*. B. Weiler's *Within the Law* had a fairly good run (Réjane). The interesting effort of Jacques Copeau in New York is treated under **DRAMA**.

**POETRY.** Fernand Gregh, one of the very best poets of France, offers *La Couronne douloureuse*, a collection of beautiful verses contrasting the quiet, meditative, artistic France of before the war, with the France mangled by the work of the brutal Huns. The powerful gift of satire, that we knew had been bestowed upon Félicien Champsaur, is made use of in a long poem the title of which betrays the inspiration: *L'Assassin Innombrable, Symphonie dramatique de haine contre Guillaume II . . . et Chant d'amour pour nos morts*. A place by itself must be granted to Max Leclerc, who produced one of the gems of war literature with his *La Passion de Notre Frère le Poilu*, a modern "Conte dévot" full of exquisite pathos (Prix Revel awarded by French Academy), and also a collection of poems, *Souvenirs de tranchées d'un poilu*. Louis Mercier's *Prières de la Tranchée* are also of fine quality. Other collections of value are: G. Champenois, *Miracle de France*, L. Christophe, *Rose à la lance nouée*, Villodon, *Chants de guerre*, J. Bellouard, *Un chant de consolation* (the author is a priest; Barrès wrote an enthusiastic introduction), A. G. Garnier, *Gloire de la terre*, Magali Boissnard, *Le chant des femmes, poèmes de guerre et d'amour*. Delemère and Millet are two young poets who publish works of great promise in the little review *Vivre*. Among those who ignore the war, living even now all for their art, let us quote Milosz, *Poèmes* (Baudelarian), P. Valéry, *La jeune Parque* (he is the last Mallarmiste), Ch. de Saint Cyr, in *L'âme et le cœur*, continues his propaganda in favor of the renewal of poetry, or "Intensisme," and against such poets as Rostand, Romain, Gregh, etc. A. Cantacuzène, in his *Hypotyposes*, claims, without revolution, to

just be allowed to write graceful poetry about anything that may prompt his inspiration. There should be mentioned under this heading a revival of the French "Chanson" since the war; see an article by Ernest Charles, in *Opinion of*, February 10, 1917: "*Le Caveau et les Théâtres des Chansons*."

NOVEL. The list is very long. Paul Acker (the author of *Soldat Bernard*) has a posthumous novel (*Entre Deux Rives*) in which he opposes the traditional ethics to the deceptive modern formula of living one's own life. Most novels have the war as a background. Bourget's *Lazarine* tells of the conversion to catholicism of a soldier after two rather complex love adventures. Marcel Berger's *Miracle du feu* is another story of moral regeneration through the war; so is G. Dérès' *L'occasion, l'herbe tendre*; Melle Harlor pictures the struggle between international dreams and concrete patriotism in *Liberté chérie*; Ch. de Rouves's *Française du Rhin* was crowned by the Academy; B. Vallotton's *On changerait plutôt la place du cœur* endeavors to show how the Alsations were true to France at the bottom of their heart even if they did not realize it entirely before the war. Colette Yver, in *Mirabelle de Pampelune*, wrote the novel of a woman marrying a blind soldier; Foley, *Sylvette et son blessé*, is a charming war idyl; Léon Daudet is more realistic in his *Le cœur et l'absence*, as is D. D'Archimbaud in *Une vie intime*; and again very much in agreement with present preoccupations, are Fr. Bouquet, *Celles qui les attendent*, and Jeanne Landre, *L'Ecole des Mairaines* (one of many witty appreciations of the "mairaine" institution). Well worthy of the fame of Antoine Redier (the author of the lofty *Méditations dans les Tranchées*) is his novel, *Pierrette*, a discussion among soldiers of the attitude of woman towards repopulation. M. Nadaud offers two remarkable "romans aériens," *Chignole* and *Les derniers Mousquetaires*; let us further mention Guiche, *Deux soldats*; Causse-Mael, *L'âme d'un canon*, and collections of short stories: Farrère, *Histoires de quatorze soldats*, and Pierre Mille's *En croupe de Bellone*, and *Sous leur dictée*—both names are guarantee for the quality of the books. The comic note is in the foreground in A. Billy, *La Malabéc* (a magic plant which revives intensely former sensations, and here the sensations of the delight of life before the intrusion of the war-lords is amusingly described), in A. Boissière, *L'extravagant Teddy de la Croix Rouge Anglaise*, and in P. de la Fouchardière, *Scipion Pégoulade* (a Tartarin of the war); Audigier, *La Terre qui renaît*, is a beautiful peasant novel. Novels which have nothing to do with the war and which must be mentioned are: E. Clermont, *Histoire d'Isabelle* (the author died in the war; he was specially known for his *Laure*); Rosny, *ainé*, *L'Enigme de Girreux*; G. Vaucaire scored a decided success with his charming *La Demoiselle du Cinéma*; E. Dautrin's *L'Envolée* is the story of a woman who uses the lofty love a man has for her to start him in life, and then disappears; Pol Neveux evokes sweet memories of youth in the charming Champagne in his *Douce enfance de Thierry*. E. Estaunié gives three short stories (*Solitudes*) in his usual style. Miomandre publishes to-day a novel which he had completed before the war, in which he describes most humorously and wittily the man who always dreams of success even

when he is summoned before court for bankruptcy; his book, *Veau d'or et vache enragée*, is a Chantecler in prose. Then we have exotic novels—as if there was no war going on—: Mirriam Harry, *Pagode d'amour*, J. d'Or Sinclair, *Noces de Jade*; Jérôme et Jean Tharaud in *L'Ombre de la Croix* describe a Jewish community in the Carpathian mountains. Gloomy realism we have also: Ch. Hirsch, *La grande Capricieuse* (two "blasés" haunted by death); Francis Carco, *Les Innocents* (nerve racking); M. Elder, *Vie apostolique de Vincent Vigame* (a plebeian artist who is trying to understand himself).

WAR-PROSE. Barbusse's *Le Feu* (which was awarded one of the Prix Goncourt) was by far the most widely read war book of the year, though in certain quarters it was criticized on the alleged ground that it belittled the soldier's heroism. Jean des Vignes Rouges's *Bourru, soldat du Vauquois*, while realistic enough, brought into relief the courage and intelligence of the soldier. G. Bonnet, *L'âme d'un soldat* is a fine analysis of a soldier who is an intellectual. Exhibiting a magnificent spirit of heroism are Diéterlen's *Le Bois Le Prêtre*, and Le Bail's *La brigade des Jean Legouin*; H. Bordeaux has a sequence to his *Derniers Jours du Fort de Vaux*, in *Captifs Délivrés*. All the following are remarkable books: E. Lintier's (the author of the famous *Ma pièce*) posthumous *Avec une batterie de 75, le tube 1233*; Marcel Dupont, *En Campagne*; Lieut. E. R. (Capt.) Truffeau, *Carnet d'un Combattant*; Capt. Langevin, *Les Cavaliers de France*; Guy Vernazobus, *Journal d'un officier de cavalerie*; Capt. Belmont, *Lettres d'un officier de Chasseurs Alpins*; P. Duval-Arnould, *Crapouillots* (the little mortars which throw torpedoes; very interesting); Pierre de Kadora, *Mon groupe d'auto-canon*; G. Lafond, *Ma mitrailleuse*; M. Genevoix, *Nuits de guerre*; A. Erlande, *En campagne avec la Légion Etrangère* (widely read); R. Milan, *Vagabonds de la gloire* (2d series); J. Valmy-Baisae, *Les Pépères de la Victoire*; Jacques Pirenne, *Les vainqueurs de l'Yser* (the Belgian army); Maurice Dekobra; *Messieurs les Tommies* (the Tommies as seen by a Frenchman); E. Zavie, *Prisonniers en Allemagne*; Ginisty and Gagneur, *Histoire de la guerre par les combattants*. The publisher Lemerre issued a collection *Les As* (Aces, the pick of the aviators) *peints par eux-mêmes*. These are books by physicians: L. Chauveau, *Derrière la bataille*; G. Duhamel, *Vie des Martyrs*; Dr. P. Fiollet (now killed), *La Marsouille* (nickname given to those ambulancers who pick up the wounded on the field of battle); M. Donnay, *Lettres à une Dame Blanche* (lady of the Red Cross). A charming little tale of a young officer on leave is Paul Géraldy's *La Guerre, Madame*. . . . Perhaps the best Diary of the war, for Paris and France, is found in Blanche's *Cahiers d'un artiste* (the 3d vol. of which is now out); Paul Patté's *Le cran*, and G. Alphaud's *France pendant la guerre* are excellent, too; and so are the two following books by women: Isabelle Rimbaud (the sister of the poet), *Dans les Remous de la bataille*, Marguerite Yerta, *Les six femmes et l'invasion*, the latter without any literary pretense. Finally the following deal with War and Religion: M. Barrès, *Les familles spirituelles de la France* (one of the stirring books since the war began); E. Bauman, *L'abbé Chevoleau, caporal au 90°*

*d'infanterie*; Roger Allier, *In Memoriam* (letters published by his family); Jean Guiraud, *Clergé et Congrégations au service de la France* (this is propaganda). The Prix Goncourt went to H. Malherbe's *La flamme au poing*; competitors were Giraudoux's *Lectures pour une ombre*, and A. Fribourg's *Croire*—all three war books.

**HISTORY OF LITERATURE AND CRITICISM.** Here, owing to the war, the output continued to be poor. Paul Gaultier recalls *Edgar Quinet, un Prophète*; G. Mossé adds another study to the many Vigny studies since the war, *Le Pessimisme de Vigny*; Ripert writes on *La versification de Mistral*; P. Desanges on *O. Mirbeau*. W. H. Scheffley publishes in New York *Brieux and Contemporary French Society*, and Albert Schinz writes an abundantly documented article on "The Renewal of French Thought before the Great War" (*Journal of American Psychology*, June, 1916). Georges Docquois, in *Nos émotions pendant la guerre*, studies the reaction of well known men of letters to the war. Humorist with his pen as well as with his crayon, Sem publishes an album, *Un Pékin sur le Front*; and Poulbot has made a pathetic book of the same order: *Des Gosses et des Bonshommes*. The Cinquantième of Baudelaire's death has been widely commemorated by editions and articles. The Centenary of Mme. de Staël's death was commemorated in Geneva. Some have also reminded us that Lamartine's *Le Lac* was written in 1817. We have to record the death of Marquis de Vogüé, of Paul Meyer, and Adrien Bertrand. The French Academy has had its first "Reception" since the war. Alfred Capus was the hero of the day. The next to be elected will be Marshal Joffre—who never wrote anything . . . except a great page of history called "The Battle of the Marne."

**FRENCH SOMALI COAST.** A French protectorate on the gulf of Aden. Official report gives area 120,000 square kilometres, and population 213,000. Jibuti, the capital, has about 17,000 inhabitants. Imports (1915), 24,106,230 francs (21,024,712 francs in 1910); exports, 40,996,039 (33,566,887).

**FRENCH WEST AFRICA.** A French African possession composed of the following colonies and territories, with estimated area and 1915 (estimated) population as follows:

	Sq. km.	Pop.
Senegal .....	191,600	1,247,979
French Guinea .....	239,000	1,812,579
Ivory Coast .....	325,200	1,417,029
Dahomey .....	107,000	911,749
Upper Senegal and Niger .....	782,700	5,598,978
Mil. Ter. of the Niger....	1,383,700	850,094
Mauritania .....	893,700	600,164
<b>Total.....</b>	<b>* 3,922,900</b>	<b>12,438,567</b>

\* 1,514,632 square miles.

The administration of the French possessions in northwest Africa (inclusive of the French Congo), which was in process of reorganization from 1895, was completed and consolidated by a decree of October 18, 1904. The territories of Senegambia and the Niger were converted into a separate colony under the name of Upper Senegal-Niger, and a commissioner attached to the general government was appointed for the administration of the civil territory of Mauritania. Later, the Niger territory was separated from Upper Senegal and Niger colony and be-

came an administrative subdivision known as the Military Territory of the Niger, under a commandant. In 1916 Tibesti, a region recently occupied by the French, was made a part of the military territory. A general budget was created, to be settled by the governor-general in council, to which are devoted the funds derived from the customs and navigation duties of all the constituent colonies, and which provides for all expenses which interest all the colonies generally. The several colonies, therefore, can only reckon on the funds arising from their internal resources, such as the capitation tax, trading licenses, etc., but they are at the same time relieved of many expenses which have been transferred to the general budget. Provision is also made in the general budget for subventions to those of the colonies requiring financial help. Senegal is the oldest and most important of the French possessions in West Africa. It is situated to the north of the British colony of the Gambia; its capital is St. Louis. French Guinea includes the settlements of Rivière du Sud (capital Konakry) and Futa Jallon, and extends up the whole of the northwest coast (save where intercepted by Portuguese Guinea and the British colony of the Gambia) to join the colony of Senegal. Between the British colony of the Gold Coast and the republic of Liberia is the French Ivory Coast (capital Bingerville), including the settlements of Grand Bassam and Assinie and the Kroo country with the hinterland. To the south is Dahomey, between the British colony of Lagos and German Togoland. It consists of about ninety-five miles of the Benin coast, where are the settlements of Kotonou and Grand Popo with the hinterland. The ancient capital of the colony is Abomey, which has now been transferred to Porto Novo. The chief port is Kotonou. Bamako is the capital of the Upper Senegal and Niger colony. The governor-general for French West Africa (M. van Vollenhoven, appointed May 10, 1917) resides at Dakar.

A British authority gives in pounds sterling the following trade figures for 1914 and 1915:

	Imports		Exports	
	1914	1915	1914	1915
Senegal .....	3,202,746	2,850,569	3,217,895	3,231,792
Upper Senegal and Niger ..	223,715	187,427	95,785	67,995
French Guinea ..	369,527	387,572	456,121	650,619
Ivory Coast ..	465,427	286,470	342,601	287,160
Dahomey ....	475,210	425,250	518,114	526,571
Mil. Ter. of the Niger...	40,024	54,116	24,384	64,813
<b>Total.....</b>	<b>4,766,658</b>	<b>4,191,404</b>	<b>4,654,900</b>	<b>4,828,950</b>

The products and exports are peanuts, rubber, palm kernels, palm oil, gum arabic, live animals, etc. In 1915, 1844 vessels of 3,348,248 tons entered the ports of French West Africa.

For 1917 the general budget for the colonies balanced at 24,172,000 francs.

**FRIEDHEIM, ARTHUR.** See *MUSIC, Artists, Instrumentalists*.

**FRIEDRICH, JOHANNES.** A German theologian and ecclesiastical historian, leader of the Old Catholics, died August 11, 1917, at Munich. He was born at Poxdorf in 1836, was educated at Bamberg and Munich universities, became a Catholic priest in 1859, and in 1865 was appointed professor of theology in the University of Munich, and in 1867 a member of the Acad-

emy of Sciences. He was a pupil of Döllinger and in 1869 was a delegate to the Vatican Council at Rome. Here Friedrich strongly supported Döllinger in the latter's opposition to the dogma of papal infallibility. As a result he was excommunicated in 1871, and eleven years later he was transferred from the chair of theology to that of history. This was due to Ultramontane influence. In 1874 Friedrich opened the Old Catholic theological faculty at the University of Bern and lectured there for a year. His most notable work is the *Kirchengeschichte Deutschlands* (1867-69); but his *Tagebuch während des Vatikanischen Konzils geführt* (1871) and *Documenta ad Illustrandum Concilium Vaticanum* (1871) are important sources of information concerning proceedings of the Vatican Council. His other publications include: *Der Mechanismus der vatikanischen Religion* (1876); *Geschichte des Vatikanischen Konzils* (1877-87); *Beiträge zur Geschichte des Jesuitenordens* (1881); *Johann Adam Möller, der Symboliker* (1894); *Jacob Frohschammer* (1896); and *I. von Döllinger* (1899-1901).

**FRIENDS, RELIGIOUS SOCIETY OF.** There are four branches of this denomination: The Orthodox, Liberal (Hicksite), Wilburite, and Primitive. The Orthodox body is the most numerous and in 1917 had about 100,000 members, 1315 ministers, and 775 meeting-houses. The Hicksite branch had about 20,000 members and 211 meeting-houses; the Wilburites about 3900 members, 47 ministers, and 48 meeting-houses; the Primitive, about 171 members, 10 ministers, and 8 meeting-houses. The Five Years' Meeting is the central organization of the Orthodox body. It includes 13 yearly meetings. The Friends' General Conference includes the seven yearly meetings of the Hicksite body. Both have shown considerable activity in recent years. Summer schools are held and Woolman House, a Friends' School for Social and Religious Education, was established at Swarthmore, Pa., in 1915. All branches of Friends unite in the propaganda of their peace principles. During the war American and English Friends have combined most effectively in furthering the work of the Red Cross. After the battle of the Marne the English Friends began to aid in rebuilding and rehabilitating northern France. In this work American Friends of all branches have also engaged; and since the entry of the United States into the war American Friends have pledged themselves to a great programme of reconstruction, in coöperation with English Friends and the American Red Cross. The work of all the Friends is now merged into an organic part of the American Red Cross, with the title "Bureau of Friends' Unit of the Department of Civil Affairs of the Red Cross." At the close of 1917 practically all the civilian relief work of the Red Cross was in the hands of the Friends, and plans had been made for greatly increasing the scope of the work. At first the French government assisted the Friends until the American Red Cross entered the field; but now the Red Cross has undertaken to bear the expense of machines, houses, furniture, etc., in the work of reconstruction, the Friends pledging themselves entirely to maintain their own workers. Financed entirely by the Friends themselves, relief work similar to that in northern France is done among Belgian refugees in Holland, Serbian refugees in Corsica, and in

the province of Samara in Russia. See **RED CROSS, AMERICAN NATIONAL**.

**FRISSELL, HOLLIS BURKE.** Dr. Frissell, a well known educator, died on August 5, 1917, at the age of sixty-six. He had been the principal of the Hampton Institute for almost a quarter of a century before his death and was its chaplain for about fifteen years before that. His life was one of self-sacrifice and devotion to others. Under his personal direction Hampton Institute became a centre of industrial and agricultural enlightenment. It trained Indians and negroes for the farms and for the trades.

**FROSTS.** See **HORTICULTURE**.

**FRUIT.** See **HORTICULTURE**.

**FUEL.** See **CHEMISTRY, INDUSTRIAL**.

**FUNGOUS DISEASES.** See **BOTANY, Plant Diseases**.

**FUNSTON, FREDERICK.** An American soldier, died February 19, 1917, at San Antonio, Tex. He was born at New Carlisle, Ohio, November 9, 1865, but while he was a boy his family moved farther west and in 1881 settled on a Kansas farm. After two and a half years at the University of Kansas, he went to work in 1888, first as a train conductor and then as a reporter in Kansas City. Love of adventure attracted him to the investigating work of the Department of Agriculture. As agent of the department, he accompanied the Death Valley expedition, and later made dangerous journeys in Alaska. Next he made his way into Mexico, where he gained a knowledge of Spanish and made himself a master in the handling of machine guns. This combination of abilities proved irresistible when he offered his services to General Gomez of the Cuban insurgents in 1896. He participated in twenty-two battles and made himself invaluable to both Gomez and Garcia.

Promoted to lieutenant colonel, he received a leave of absence and was at home when the Spanish-American war broke out. He was at once commissioned colonel of the 20th Kansas Volunteers and was sent to the Philippines. There, while serving in the northern Luzon campaign under Gen. Arthur MacArthur, he performed the exploit that earned him promotion to brigadier general of volunteers and the congressional medal of honor. On April 26, 1899, he crossed the Rio Grande at Calumpit on a small bamboo raft under heavy fire and established a rope ferry that won the battle for the American forces. But the feat for which he became most famous was the capture of Aguinaldo, the rebel chieftain, on March 23, 1901. This Funston accomplished without loss of blood and by a ruse, at the end of a dangerous march with only ten Kansas volunteers as support. He was then in command of the Fourth District of northern Luzon. At this time he was promoted to brigadier general, U. S. A.

After his return to the United States in the same year, Gen. Funston was in command successively of the Departments of the Colorado, the Columbia, the Lakes, the Southwestern Division, and California, and of the Army Service Schools. Then he was sent abroad again, and in 1911-13 was commander of the Department of Luzon, and thereafter for some months of the Department of Hawaii. In January, 1914, he became commander of the Second Division of the United States army, and in the following April commanded the Vera Cruz expedition.

His services as military governor of that city brought him the rank of major general. Since February, 1915, he had been in command of the Department of the South, and since 1916 had had control of the entire military force on the border, with headquarters at Fort Sam Houston. He directed the punitive expedition into Mexico, headed by Gen. Pershing, and is said to have had an almost unparalleled amount of executive work to handle. His death was due to heart disease.

The San Francisco earthquake and fire came while Funston was stationed there in 1906. At this time, when the city called for Federal aid, his energy and executive ability in organizing relief for the inhabitants and in maintaining order won high praise. His most famous measure was the destruction of all liquor in the city. Because of his height, which was only five feet, four inches, he was popularly known among soldiers as "the Bantam of the Army" and "the Little Man of War," and he was much liked for his soldierly qualities combined with a democratic dislike of military show. His body lay in state in the Alamo at San Antonio, and in the San Francisco city hall, and was interred in the national cemetery at the Presidio. Gen. Funston's home was at Iola, Kans.

**FUR-BEARING ANIMALS.** See ALASKA.

**FURST, WILLIAM.** William Furst, a leading composer of incidental music for theatrical productions and a noted orchestra leader, for years associated with David Belasco, for whose plays he wrote accompanying selections, died on July 11, 1917, at the age of sixty-five. For more than thirty years he had been known as a most versatile composer of theatrical music, and among the stars for whose productions he wrote were Sir Herbert Tree, Maude Adams, Otis Skinner, William Faversham, Viola Allen, Henrietta Crossman, and Mrs. Leslie Carter. The latest music he wrote was for Miss Geraldine Farrar's appearance in "Joan the Woman." He wrote the music of "The Isle of Champagne" and composed light operas for Lillian Russell, Dela Fox, Jefferson De Angelis, and other stars.

Among his notable compositions of incidental music are: *The Heart of Maryland*; *Under Two Flags*; *Du Barry*; *Zaza*; *Madam Butterfly*; *The Darling of the Gods*; *The Music Master*; *The Rose of the Rancho*; *The Girl of the Golden West*; *The Return of Peter Grimm*; *The Concert*; and *Marie-Odile*.

**GALICIA.** A crownland and titular kingdom of Austria. It is bounded on the north by Russian Poland, on the northeast by the Russian government of Volhynia, on the east by the Russian government of Podolia; at the southeast it touches Bessarabia, and on the south the Bukowina and Hungary, being separated from the latter by the Carpathian Mountains. Galicia formed a part of Poland from the fourteenth century till 1772, the year of the first Polish partition. It is the largest of the Austrian crownlands, having an area of 30,308 square miles, or about 26.2 per cent of the empire. The population according to the census of December 31, 1910, was 8,025,675 (about 28.1 per cent of the Austrian total), as compared with 7,315,939 in 1900; as estimated in 1913, 8,211,770. The number of Austrian subjects in Galicia in 1910 was 7,980,477; of these, Polish was the vernacular of 4,672,500 (58.55 per cent); Ruthenian, 3,208,092 (38.38 per

cent); German, 90,114 (1.13 per cent); Bohemian, Moravian, or Slovak, 8718 (0.11 per cent). About 93 per cent of the Austrian Poles and about 91 per cent of the Austrian Ruthenians are inhabitants of Galicia; of the remaining Ruthenians, over 8 per cent (305,101) were in the Bukowina at the 1910 census. Of the Galician population in 1910, Catholics (including those of the Roman, Greek, and Armenian rites) numbered 7,112,574 (88.61 per cent); Evangelicals, 37,144 (0.46 per cent); Orthodox, 2845 (0.05 per cent); Jews, 871,895 (10.86 per cent). In 1910 the percentage of persons over 10 years of age who could neither read nor write was 40.6, being 36.3 for males and 44.6 for females; for all Austria the percentage was 16.5, or 14.7 for males and 18.3 for females. Of the inhabitants in 1910, about 73 per cent were dependant on agriculture. The capital of Galicia is Lemberg, the seat of one of the eight Austrian universities and of one of the seven technical high schools. Urban population as returned by 1910 census (estimates of June 30, 1914, in parentheses): Lemberg, 206,113 (212,000); Cracow; 154,141 (171,000); Przemyśl, 54,078 (57,000); Kolomea, 42,676 (45,700); Tarnów, 36,731 (38,700); Drohobycz, 34,655 (40,000); Tarnopol, 33,871 (35,200); Stanisław, 33,328 (34,400); Strzyż, 30,895 (34,400); Neusandez, 25,004; Jaroslau, 23,965. Galicia has a unicameral diet of 161 members and is represented in the Austrian Reichsrat by 106 members. See AUSTRIA-HUNGARY and WAR OF THE NATIONS.

**GALLAUDET, EDWARD MINER.** An American educator of the deaf and dumb and an authority on international law, died on September 26, 1917. He was born in Hartford, Conn., in 1837, and was graduated from Trinity College in 1856 and became a teacher in the institution for the deaf and dumb which his father had founded in Hartford. In 1857 he moved to Washington, where in conjunction with others he established an institution similar to that at Hartford, known as the Columbia Institution for the Deaf and Dumb. He became president of its two distinct departments, the Kendall School and the National Deaf Mute College, which in 1893 were named, in honor of his father, Gallaudet College. In 1867-68 he made an extended trip to Europe, visiting the principal institutions for the deaf and dumb and publishing on his return a full and extremely valuable report. In 1880 he was a delegate to the international congress of instructors of deaf mutes, held in Milan, Italy, and in 1883 was the president of the convention of American instructors of deaf mutes held at Jacksonville, Ill. In 1886 he gave information on American methods of teaching the deaf, dumb, and blind before a royal commission appointed to investigate and reorganize the system in England. His distinguished work won him honorary degrees from Trinity, Yale, and Columbian (now George Washington) University. His work as an educator of the deaf won him the honor of being a Chevalier of the Legion of Honor. His publications include *A Popular Manual of International Law* and *Life of Thomas Hopkins Gallaudet*, his father.

**GAMBIA.** A British West African colony (formerly part of the West African Settlements, made a separate colony in 1888) on the river Gambia (area 69 square miles), with a pro-

tectorate extending on both banks of the river for 250 miles from its mouth (about 4000 square miles). Capital, Bathurst, on St. Mary's Island. The cultivation of peanuts is the principal industry. Imports, 1915, £521,151 (1910, £578,983). Imports of cotton goods in 1915, £63,307 (£130,611 in 1910); kola nuts, £60,262 (£65,534); rice, £27,115 (£46,087); sugar, £2857 (£9708); spirits, £4104 (£7129); specie, £218,656 (£208,544), etc. About 49 per cent of the imports come from England. Exports 1915, £595,797 (1910, £535,447). Exports of peanuts (mostly to France) in 1915, £400,435 (in 1910, £387,943); hides, £11,911 (£11,310); palm kernels, £5457 (£5640); specie, £165,177 (£112,194), etc. Revenue, 1915, £92,253 (1910, £82,880); expenditure, £89,028 (£83,301).

**GANZ, ALBERT F.** Professor of Electrical Engineering at Stevens Institute of Technology and a widely known consulting engineer, died on July 28, 1917. He was born in Elberfeld, Germany, on April 25, 1872, but came to this country in 1881. He was graduated from Stevens in 1895 and was appointed instructor in applied electricity immediately after his graduation. In 1902 he was appointed professor of electrical engineering and head of the electrical department. He contributed many scientific papers to technical societies and journals. He was a member of the American Society of Mechanical Engineers, the American Electrochemical Society, the Society for the Promotion of Engineering Education, the Illuminating Engineering Society, and the American Gas Institute, and a fellow of the American Institute of Electrical Engineers, and the American Association for the Advancement of Science.

**GARBAGE AND REFUSE DISPOSAL.** The war was decreasing the volume of garbage and other classes of municipal refuse and reducing the volume of recoverable commercial wastes which they contain. At the same time it was increasing the practice of utilizing these materials to the utmost. The war reaction as a whole bid fair to cause lasting changes in these, as in many other, fields. Besides reducing sheer wastefulness and stimulating the utilization of such materials as unavoidably find their way to the garbage, ash, and refuse cans, war stress was hastening the understanding of the fact that the disposal of this whole class of waste is a matter of municipal cleansing rather than of public health, and that the problems involved lie in the fields of engineering and economics, instead of preventive medicines. This does not mean that waste disposal should not be conducted in a sanitary way. Rather it indicates that its direction should be in the hands of the department of engineering and public works, and not in the health department. As the war drove this fact home, through giving courage to break away from old traditions in a time of emergency, garbage and refuse disposal would be put on a sounder basis. The practical effects of this, as already shown in 1917, were to increase the feeding of garbage to hogs, to stimulate the building of garbage-reduction plants where time and funds permitted and pig-feeding was or seemed to be impracticable, and to lessen the construction of incinerating plants for garbage disposal while adding to the number used to burn the tailings from refuse sorting and utilization plants.

A further effect would be to force the separa-

tion of garbage from ashes at the house door. In many cases a third separation would be caused. With three waste cans, garbage will be kept free from all other waste and can thus be more readily be fed to hogs or treated in reduction plants; paper, twine, bottles, tin cans, rubber, and leather, can readily be separated on sorting belts at a central plant, packed and sold, while the combustible tailings go to a furnace which produces steam for operating the sorting works; and ashes, free from the organic matter which constitutes garbage and from miscellaneous refuse which has saleable value, and if not recovered causes unsightly litter, may be disposed of for filling or otherwise in the most convenient location, after a short and inexpensive haul.

In smaller cities or under special conditions ashes and rubbish may be mixed and dumped together. In some localities, where local conditions are favorable or money very short, garbage, rubbish, and ashes may be hauled to a dump, due care being taken to keep clean ashes at the top. In extreme cases, garbage alone may be removed by the city. The preceding discussion does not mean that existing garbage and refuse incineration plants should be shut down or that new ones should not be built. The question should be decided in each case according to local conditions, as interpreted by a competent refuse disposal engineer. Such a person may advise incineration of mixed refuse, either in high temperature destructors, with steam utilization, or in a furnace of lower temperature and cost, with no attempt to utilize steam.

**GARBAGE UTILIZATION DIVISION, UNITED STATES FOOD ADMINISTRATION.** Eloquent testimony to the importance of garbage disposal in its relation to food conservation and the war was afforded by the fact that in the latter part of 1917 the United States Food Administration created a division of garbage utilization. For chief of this division, Mr. Hoover selected I. S. Osborn, an engineer with large experience in garbage disposal. In a paper read before the American Public Health Association in October, Mr. Osborn stated that returns to the United States Food Administration showed that for the first nine months of the year there was an average decrease of from 12 to 15 per cent in the garbage collection of sixty cities of the country. Some cities showed an increase over previous years. Some of the decrease was attributed to less thorough public collection and some to more extensive private collection for pig feeding and for reduction. From the garbage treated in reduction plants, the yield of grease was 15 per cent less per ton than in the previous year. This decrease would probably have been still greater had it not been for the fact that butchers were not trimming their meat sold to customers as closely as before. Evidence of this is found in the decreased quantity of scrap collected from butchers by rendering companies.

Mr. Osborn stated that garbage piggeries would be found desirable in many cities. Each thousand population produces food waste, he said, sufficient to fit twenty-five hogs for market. At the current price, a ton of garbage would produce from \$7 to \$8 worth of pork. For larger cities, Mr. Osborn suggested that garbage reduction would prove to be the most advantageous method. At October, 1917, prices,

the existing garbage reduction plants were recovering grease to the value of about \$8,500,000, and tankage for fertilizer base to the value of \$2,250,000 a year. The grease is utilized in various ways, the most valuable grease content being glycerine. The garbage grease produced each year in reduction plants in operation in the United States was sufficient to make 8,000,000 lbs. of nitroglycerine and still leave sufficient grease to make about 200,000,000 twelve-ounce cakes of soap. Mr. Osborn pointed out that the shortage of fats and fertilizer would continue for many years after the war, thus giving encouragement for the installation of garbage reduction plants. Before the creation of the garbage utilization division of the United States Food Administration, the United States Department of Agriculture had begun an investigation of feeding garbage to hogs. The study was put in charge of a sanitary engineer and of a veterinarian. It was expected that a report on the subject would be issued in 1918 and that Mr. Osborn would also issue a report.

**GARBAGE PIGGERIES CONFERENCE.** On October 7, Mr. Osborn held a conference at Chicago on municipal garbage piggeries. About twenty-five sanitary engineers, health officers, superintendents of piggeries, both municipal and private, meat packers, and officials of the Bureau of Animal Husbandry, United States Department of Agriculture, were present. One of the objects of the conference was to obtain a consensus of opinion as to pig feeding methods and results and particularly as to the precaution which should be taken in the way of general sanitation and the protection of the hogs against disease, especially hog cholera. It was brought out that all garbage feeders agree that it is not advisable to cook garbage to be fed to hogs, except in the case of hotel waste, rich in recoverable fats. From the discussion at this conference and from other sources, it was evident that municipal garbage piggeries might be conducted in a sanitary way and that the hogs might be protected against cholera and other communicable diseases if well-known preventive measures were used. For an account of the experience of Worcester, Mass., with its garbage disposal piggery see article by F. H. Bonnet, Jr., in *Engineering-News Record*, of August 30, 1917.

**GARBAGE AND REFUSE DISPOSAL AT ARMY CANTONMENTS.** Revenues reaching many hundred thousand dollars a year were being obtained by the United States War Department from the garbage and other wastes at the army cantonments and other army camps. The work was started in the latter part of 1917 on a somewhat tentative basis so far as contract prices are concerned. The garbage and a number of other different classes of refuse were put each in a separate can and were collected and removed to a transfer station. The contractor took the refuse to a point at least three miles from the camp. The garbage at some of the camps was fed to hogs, while from some it was taken to reduction plants. The contractors also removed and paid for manure from the large number of horses and mules at the camps.

**THE LARGEST GARBAGE-REDUCTION PLANT IN THE WORLD.** During the year a new garbage-reduction plant for the disposal of the garbage of the larger part of New York City was put in operation on Staten Island (Borough of Rich-

mond). The plant had a contract capacity of 2000 tons a day. It was built by the Metropolitan By-Products Co. under a contract which provided that the company shall receive all of the garbage of New York, except a part of Queens Borough and Staten Island, for a period of five years and pay the city a total of \$900,000 for the garbage. The city had the right to buy the plant at the expiration of the contract. The city delivers the garbage to various waterfront loading stations, where it is dumped into barges which convey the garbage to the reduction works. At the unloading wharf a two-yard clamshell bucket lifts the garbage from the barges to a large receiving hopper on shore, which is located over a picking or sorting conveyor. Men stationed on both sides of this conveyor pick out glass, crockery, and other foreign matter that might clog the machinery. Tin is recovered from tin cans by means of a bath of chlorine gas. The gas is condensed and thus made available for use in dyeing silk. The cans are melted and cast into sash weights. From the sorting conveyor the green garbage is delivered by a system of conveyors, eight in number, to one or another of 199 garbage reducers. These reducers are located in the building covering an area of 160 x 337 ft. The reducers are grouped in units of twenty-four each, every unit being completed in itself and operated by a separate crew of men. In these reducers the garbage is treated by the Cobwell system. The reducers are cylindrical steel shells in which are stirring paddles mounted on a central revolving spindle, driven by electric motors. Each reducer holds about five tons of green garbage. When the reducer is filled and sealed a solvent (kerosene) is introduced and steam at 100 lb. pressure is turned into the steam jacket which surrounds the digester tank, and the agitators or stirrers are started. The valves to the vapor line are opened. The vapors driven off, consisting of a mixture of solvent and water, are carried to a condenser where the solvent is separated from the water and returned for further use. The water is wasted. The cooking process is continued until the garbage is completely dehydrated, and the vapor goes to the condenser free of solvent. This requires about seven hours. The liquid in the tank, consisting of solvent and grease, is then drawn off to a still from which the solvent is recovered for further use. The reducer is then filled with solvent for a second and a third time in order to complete the extraction of the grease. The grease is barreled and sold for use in the manufacture of glycerine, soap, candles, etc. After the grease and water have been removed, the tankage is discharged from the bottom of the tank in the form of a brown, dry powdery material which has an odor resembling fresh roasted coffee. Conveyors lift the tankage some 50 ft., where it is discharged into a large revolving screen where the coarse material is taken out. The tankage then passes over a second screen and is discharged onto a belt conveyor provided with a magnet for the removal of particles of iron, such as knives and forks. The tankage then goes to a drying pan, then to a third series of screens, and finally to a shipping house. The reduction plant is run in three eight-hour shifts, and in the latter part of 1917 was reported as treating 1500 tons of garbage a day.

During 1917, Rochester, N. Y., was added to the list of cities owning and operating a garbage-reduction plant—most of these plants being privately owned. Rochester bought out a private plant which had been in operation some years. Other municipally owned plants are located at Chicago, Cleveland, Columbus, Ohio, Schenectady, N. Y., and Akron, Ohio. The last named plant was turned over by the city to a company for private operation during the year.

**NEW INCINERATOR AT TORONTO, ONT.** As a part of a programme decided upon before the war, Toronto, Ont., put in operation in 1917 a 180-ton contract capacity refuse destructor of the Sterling type. The fall programme provided for two other destructors and for the continuance in operation of an old incinerator. Official contract tests of the new incinerator showed a capacity to burn 400 tons in 24 hr., instead of the contract capacity of 180 tons.

**GARBAGE FRANCHISE GRANTED BY ST. JOSEPH, MO.** It was common practice for some of the smaller cities of the United States to let contracts for garbage collection and disposal, while many of the smaller cities leave their inhabitants to the mercies of private collectors. In 1917, St. Joseph, Mo., did the unusual thing of granting a franchise for both collection and disposal of garbage, rubbish, ashes, and manure. For removing wet garbage the grantee was authorized to charge householders 60 cents a month for the first year, 50 the second, and 40 the third and fourth, but the fifth year removal was to be free. For removing other wastes the charge was \$1 a cubic yard. The city had the option of ordering universal free service at the end of five years, by paying the contractor \$1250 a month. The garbage was to be fed to hogs.

**GARDENING.** See HORTICULTURE.

**GARFIELD, HARRY AUGUSTUS.** National Fuel Administrator. Dr. Harry Augustus Garfield is the son of James Garfield, former president of the United States, and was born at Hiram, Ohio, in 1863, and was graduated from Williams College in 1885. He taught Latin and Roman History at St. Paul's School, Concord, N. H., the next year, and in 1888 started to practice law in Cleveland, Ohio, in a firm of which his brother was a member. During his fifteen years as a lawyer he rose to a leading position in the public life of Cleveland. He was president of the Chamber of Commerce in 1898 and 1899, was an organizer of the Municipal Association, and served as vice-president of a savings bank and director in several other financial and commercial corporations.

From 1891 to 1897 he was the professor of contracts in the law school of Western Reserve University, and in 1903, Princeton, then under the presidency of Woodrow Wilson, called him into service as the professor of politics. He served in this post for five years, becoming a close friend of Grover Cleveland and Woodrow Wilson. In 1908 he was elected president of his Alma Mater, Williams, to succeed the Rev. Dr. Henry Hopkins, and is still serving in that capacity in addition to his work for the government. He was named as Federal Fuel Administrator on August 23, 1917, at which time he was just completing his work as chairman of the committee to fix the price of wheat until next year.

He is a member of the American Historical

Association, the American Economy Association, the American Political Science Association, the American Society of International Law, the American Bar Association, the National Municipal League, and the National Institute of Social Science.

**GAS, FUEL, AND ILLUMINATING.** Throughout the United States during 1917, there was a continued tendency on the part of Public Service Commissions to recognize the fact that a heat rather than a luminiferous standard for gas was desirable. This was particularly true, since there was a demand in the manufacture of explosives for toluol and other products, which were related in some way or other to the various materials used to enrich the gas, and produce a brighter flame. In October, the Public Service Commission of New York gave such permission, but a few weeks later, a similar body in New Jersey refused it, claiming that there were other ways of enriching illuminating gas than by the use of materials needed for explosives. The use of gas of lower luminosity meant that the use of incandescent gas mantles must become even more general, and that they would take the place of the open burner for practically all purposes of illumination.

During the year 1917, as a result of the war, there was a vast increase in the industrial utilization of coal gas as an industrial fuel in Great Britain. The British Commercial Gas Association published a summary of this work in the second series of *Industrial Efficiency Numbers*, which gave statistics of the percentage increase since the outbreak of the war in the consumption of gas for manufacturing and power purposes, in not a few instances, 500 per cent and over increase being recorded. Gas was also being used for motor vehicles. See AUTOMOBILES.

**GAS, NATURAL.** The value of natural gas commercially used in 1916, was greater than in any other year in the history of the industry. The amount of 753,170,253,000 cubic feet exceeded by nearly 125,000,000,000 the former record established in 1915. West Virginia produced the greatest quantity and is followed by Oklahoma, Pennsylvania, California, Louisiana, Minnesota, Texas, and Arkansas. The great increase in the production of natural gas is due, chiefly, to the enormous expansion of the gasoline industry in all the natural gas producing States, and to a greatly increased demand for natural gas fuel by industries engaged in the manufacture of munitions of war.

**GAS ENGINE.** See INTERNAL COMBUSTION ENGINE.

**GAS FOR MOTOR CARS.** See AUTOMOBILES.

**GASOLINE.** See AUTOMOBILES; CHEMISTRY, INDUSTRIAL; PETROLEUM.

**GAS POISONING.** The latest variety of poison gas used by the Germans in 1917 in the war was known familiarly as "mustard gas" and was projected in liquid form, in shells. When the liquid comes in contact with the clothing or skin, or when soldiers move over ground wet with the liquid, burns varying in degrees of severity will result. When inhaled the gas gives rise to severe inflammatory changes in the lungs, inflammation of the eyes and upper respiratory passages. The liquid is chemically dichlorethylsulphid, has very little odor, and the symptoms do not make themselves apparent until several hours after the inhalation of the gas, due to the fact that its poisonous qualities

are evolved only in the presence of moisture. The symptoms may be summed up briefly as follows: Several hours after being "gassed" the individual is attacked by epigastric distress and severe vomiting, then ensues a severe conjunctivitis, with photophobia, profuse lacrimation, and swelling of the eyelids. There are also laryngitis and bronchitis, with a sense of constriction and tightness of the chest, aphonia, and paroxysmal coughing. When the liquid has come in contact with the skin, peculiar burns, with blistering and subsequent desquamation, are observed. The diffuse bronchitis may progress into bronchopneumonia or pulmonary edema. In very severe cases death may occur within a few hours after the appearance of the symptoms; while in the less severe cases, convalescence is rapid. Soldiers are warned to avoid contact with the liquid and to apply their respirators when there is any suspicion of the presence of mustard gas. The English box respirator furnishes the best protection for the eyes and lungs. Treatment consists in giving the patient an entire change of dry clothes, putting him to bed in dry, well ventilated sleeping quarters, and in meeting the various complications as they arise.

**GASTRON.** A solution of gastric juice extracted from the mucous membrane of the stomach of the pig and containing the activated principles of the gastric cells, the enzymes, and the associated organic and inorganic constituents, in an acid menstruum containing 25 per cent of glycerin. Its acidity corresponds nearly to 0.25 per cent of hydrochloric acid. Gastron was claimed to have all the characteristics of the normal gastric secretion. It is a viscid, slightly opaque, straw-colored fluid, and is given in 1 to 2 fluid drachms doses, in cold or acidulated water, in disorders of the digestion.

**GAUPP, ERNST WILHELM THEODOR.** A German anatomist, died in January, 1917. He was born at Beuten in Upper Silesia and was educated at Jena, Königsberg, and Breslau. He taught at Jena, Breslau, and Freiburg, and from 1897 at Königsberg, where he was extraordinary professor and after 1912 ordinary professor and director of the Anatomical Institute. In 1909 he received the Carus prize of the Leopold Academy. Between 1896 and 1904 Gaupp brought out a new edition of Ecker's *Anatomie des Frosches*, and he contributed to Hertwig's *Handbuch der Entwicklungslehre*, and the chapter on "Morphologie der Wirbeltiere" in *Kultur der Gegenwart* (1913).

**GEDDES, Sir ERIC CAMPBELL.** First Lord of the British Admiralty. Sir Eric Geddes was born in India of Scottish parents and was destined for the army. At seventeen years of age, however, he left the school he was attending in England and sailed for America to get practical experience in engineering. He worked there for four years with the Homestead Steel Works and the Baltimore and Ohio Railroad. He decided that railroading was to be his profession. He spent the next six years in building and operating railroads in India, until he was called to England by the North Eastern Railroad Company in 1903. When the war broke out his work attracted the attention of Lord Kitchener, who had called into consultation the railroad managers to facilitate the transportation of troops to the continent. Kitchener retained Geddes in the War Department to superintend

the transportation of munitions from the factory to the front. After the Battle of the Somme Sir Eric was sent to France to help the French government to reorganize the congested railways. Sir Douglas Haig kept him in France as the Director General of Transportation. Later he became Deputy Director General of Munitions under Lloyd George.

As there had been dissatisfaction with the way the submarine menace was being handled there was a general shakeup in the Admiralty at the beginning of 1917. Sir Eric became a member of the Board of Admiralty, with the temporary rank of vice-admiral and the title of Controller of Shipping. In July he succeeded Sir Edward Carson as the First Lord of the Admiralty. Arthur H. Pollen, the British naval critic, says of him, "it is Geddes's secret to see things as they are, and with such luminous simplicity that he is never in doubt as to what he wants done."

**GEOGRAPHICAL SOCIETY, AMERICAN.** A scientific society organized in 1852, with headquarters at Broadway and 156th Street, New York City. During 1916 the society undertook to extend its activities along a number of different lines. It gave large support to the Crocker Land Expedition. In January, 1916, the *Bulletin* of the American Geographical Society was changed to the *Geographical Review*, a new magazine of broader scope and larger size, under the editorial management of Dr. Isaiah Bowman, Director of the Society.

During 1917 about 33,000 persons attended the public exhibitions of the society, which consisted of war maps and maps illustrating the economic geography of the world. The latest explorations were all shown on maps directly after reports were received. The society inaugurated a series of special publications of which one volume a year is to be issued. The first volume, entitled *The Andes of Southern Peru*, by Isaiah Bowman, was published in December, 1916. This was followed in 1917 by a second volume, entitled *The Frontiers of Language and Nationality in Europe*, by Leon Dominion. Both of these volumes include numerous striking photographs, sketches, and maps. For 1918 the society had in preparation an extraordinarily noteworthy and interesting book on the relation of topography to military strategy on the European battle fronts. These publications are distributed free of charge to all Fellows of the society.

The extent to which the society's ideal of public service is appreciated is shown by the fact that by the end of 1917 its membership consisted of over 3600 Fellows. The officers for 1917 were: President, John Greenough; vice-presidents, James B. Ford, Paul Tuckerman, Anton A. Raven; foreign corresponding secretary, Prof. William Libbey; domestic corresponding secretary, Archibald D. Russell; recording secretary, Hamilton Fish Kean; treasurer, Henry Parish, Jr.

**GEOGRAPHIC SOCIETY, NATIONAL.** In January, 1917, the society published the results of the 1916 expedition under Dr. Robert F. Griggs to the Katmai region of Alaska, and on May 28, 1917, a second expedition under his leadership set sail from Seattle to complete the exploration of this volcanic district and of the Valley of Ten Thousand Smokes, previously discovered (see ALASKA and EXPLORATIONS).

The society contributed to the Labrador Expedition under the leadership of W. E. Clyde Todd, curator of Ornithology of the Carnegie Museum, Pittsburgh, of which Alfred Marshall of Chicago was a co-leader. Setting out from the Gulf of St. Lawrence in the early spring of 1917, this expedition undertook geographic and biological investigations and elaborate photographic work. In the interior of Labrador, lakes and rivers hitherto unknown were discovered and mapped and data collected which form a notable addition to geographers' knowledge of this region.

The Flag Number of the *National Geographic Magazine*, October, 1917, was a remarkable issue of the society's monthly publication. It contains 1197 reproductions of past and present flags of the world, in beautiful color work, and 300 illustrations in black and white, with history and descriptions of the various flags. Five thousand copies were requisitioned for the use of United States army officers and an equal number for the use of naval officers. Two publications recently brought out are an excellent *Bird Book* and a fourth series of *Scenes from Every Land*. The membership of the society, of which Gilbert H. Grovenor is director and editor, is now nearly 650,000.

**GEOLOGY.** The governmental geological surveys continued their operations during 1917 and the many workers in private capacity added their quota to the volume of contributions which hardly fell behind that of preceding years. National service was emphasized, of course, in much of the work. The preparation of areal maps, the study of ore supplies, and the investigation of materials adapted for military road-making had a prominent place in the list of activities contributory to the national welfare. A broader view of the matter may be had from reading of the brochure *What a Geologist Can Do in War* which was prepared by R. A. F. Penrose and published by the National Research Council.

**AGE OF THE VERO MAN.** The discovery of human remains in supposedly Pleistocene surroundings was noted in the *YEAR BOOK* for 1916, wherein the evidences in support of the contemporary burial of the bones and marks of culture, as interpreted by E. H. Sellards, were set forth. It was recognized that further study was needed to confirm the preliminary examination, more particularly to correlate the fossil stratum with some well recognized member of the Pleistocene, and to substantiate the geological evidences by the inferences to be drawn from the conformation of the bones themselves. The opinion of geologists seems to hold some doubt that the burial can be placed far back in the Glacial period, on account of the marks of reworking of the deposit by stream action, although early Pleistocene animal bones are found in the vicinity. A. Hrdlička expressed the view on anthropological grounds that the bones belong to the modern stage of human development and that they agree in most of their features with those of the Indian. They may well be prehistoric, or pre-Columbian, but show no evidence of an antiquity comparable to that of the animals represented by the associated fossils. Furthermore, the fragments of pottery taken from the site seem to belong to the work of the mound-building Indians of Florida. On the whole, therefore, it would ap-

pear that the case for Pleistocene man in America has not yet been substantiated by indubitable proof.

**RETREAT OF ALASKAN GLACIERS.** The shrinkage of the large Alaskan glaciers has been in progress for some time. L. Martin found that Barry glacier in Prince William Sound had retrograded at its foot about two miles in the interval between 1899 and 1910. A more recent study by B. L. Johnson would indicate a steady continuance of the retreat, for the ice-front in 1914 was 8200 feet farther back than in 1910, as measured along the eastern edge where the waning has been at a maximum. In the last survey the glacier was found to have almost severed connection with Coxe glacier with which it had been confluent.

**PLEISTOCENE CHANGES OF SEA-LEVEL.** A study of the submergence of the St. Lawrence Valley during the Glacial period, after the withdrawal northward of the ice-sheet, has been made by Kirtley F. Mather who supplied some interesting computations of the variation of the strand-line during successive intervals. In its maximum stage the ice may have covered an area corresponding to a circle with a radius of 14°, or 966 miles on the earth's surface. If a thickness of 5000 feet be assumed as prevailing in the central mass and a slope for the upper surface increasing from zero to 51 feet near the margin, it is found that the mass of ice would involve a lowering of the sea-level of 82.5 feet vertically, as result of the withdrawal of water for its accumulation. As a counterbalancing factor, the gravitative attraction of the ice would distort the bordering ocean so that the shore-line would advance 136 feet above the general level of the undisturbed waters. Under the conditions named, it appears, therefore, that the strand-line must have shown a positive movement, that is the sea invaded the land to a distance of over 50 feet. It is hardly to be doubted, however, that the formation of the several ice-sheets in North America and Europe was practically contemporaneous, so that the cumulative effects of all must be reckoned with in ascertaining the resultant changes of sea-level. If all the area thus covered bore a cap 5000 feet thick on the average, the sea would have been lowered 235 feet by the abstract of water, more than enough to counterbalance the effects of the gravity pull. The result must have been a negative migration of the strand-line. The conclusion seems inevitable that the period of ice accumulation was accompanied by a receding shore and the period of ice retreat by the advance of the sea upon the land. The factor of isostatic compensation is difficult to estimate; field data in the Great Lakes region lead to the inference that readjustments in consequence of changing load upon the land surface were gradual and that elevation lagged considerably behind the removal of the ice. Marine fossils of post-Glacial age are found in the Hudson Bay drainage area as high as 450 feet above tide, showing uplift of that amount since the Labrador ice-sheet shrank to a diameter of 200 or 300 miles.

**LAKE BONNEVILLE.** The glacial origin of the expanded waters in the Great Salt Lake Basin, known as Lake Bonneville, so familiar from the descriptions by Gilbert, has been questioned by C. R. Keyes on the evidence of certain topographical features. The old lake, with its splen-

didly marked shore features, had come to be regarded as a classic example of the type that was brought into existence by the moist climatic conditions that prevailed during the Glacial period. It covered some 20,000 square miles, compared with 2000 miles for the present remnant, and had a depth of several hundreds of feet. Keyes regarded the development of the old lake as a special phase in the history of a trunk stream whose waters were held back in their course by the appearance of a mountain barrier which arose too rapidly for the river to master, thus leading to the impeding of the flow. The neighboring Green River, on the other hand, by reason of its greater size was able to hold its own and continue on its course across the barrier presented by the bulging Colorado dome. The subsequent shrinking of the lake that was thus brought into existence came about by the diversion of the headwaters of Virgen River. The lake then evaporated until equilibrium was finally reached between wastage and the greatly reduced inflow, as prevails at the present time. This view was novel and interesting, but required substantiation from a broader field of observation than seemed to have been available for the present article.

**CORRELATION OF THE PERMIAN STRATA.** The unsatisfactory state of the current methods of correlation as applied to the Permian and Carboniferous rocks of the West was noted by W. T. Lee. The lack of agreement among geologists in practice arises from the conflicting testimony afforded by the vertebrate fossils on the one side and the plant remains on the other, and in part may be ascribed to the different interpretations placed upon the fossils. To the solution of the problems geologists should apply the evidences to be had from the study of structural and lithological features of the strata. For example, the upper or red portion of the beds in New Mexico and elsewhere considered as doubtful Pennsylvanian in age is lithologically so different from the lower or undoubted Pennsylvanian that it might properly be ranked as a separate formation with an independent name. These red beds of brackish-water or aeolian origin lie unconformably upon marine limestone and supply lithological and structural evidence of orogenic movement, and invigorated erosion in the Rocky Mountain region preceding the time of their deposition. Sufficient data have been uncovered to indicate that certain unconformities of seemingly different horizons may be correlated and that they may indicate a general unconformity between the true Pennsylvanian and the rocks of questionable age overlying that system.

**PETROLOGY OF ANORTHOSITE.** The origin of the rock called anorthosite presents a problem more or less distinct from that of other igneous rocks on account of its peculiar composition which consists almost wholly of the feldspar species labradorite. The temperature of fusion for such a material is very high, as compared with the rocks of mixed composition which may remain liquid at fairly low temperatures. In the latter class the minerals exist in mutual solution. N. L. Bowen considered that anorthosite might have been formed by the precipitation of feldspar from solution in a mixed magma that originally held large amounts of the iron-magnesia minerals. The latter were first separated by the operation of gravity.

Then, at a later stage, when the liquid had become distinctly lighter and was of diorite-syenite composition, the plagioclase crystals accumulated by sinking and formed the masses of anorthosite, leaving behind in the upper zone a liquid of syenitic or granitic composition. It results from this method of origin that anorthosite rarely occurs in dikes and never as an effusive rock. One of the larger bodies of anorthosite occurs in the Adirondacks where it constitutes the central massive with the higher peaks and Bowen regarded the body as a huge laccolith that was intruded in the older Grenville sedimentary series which is still well represented in the bordering Adirondack area. The syenite and granite of the region represent later invasions of the magma residual and occupy a position above the anorthosite. The theory in its general outline was attractive from its simplicity, but in the details of its application to the Adirondack region it was open to some objection, as has been shown by H. P. Cushing.

**VOLCANIC ASH IN THE GREAT PLAINS.** E. H. Barbour called attention to the enormous spread of volcanic ash in the Middle West and the evidence it afforded of the former activity of volcanoes in the Rocky Mountains. A deposit of the material practically extended over the whole of Nebraska and reached into the neighboring States of Colorado, Kansas, and South Dakota. The accumulation in Nebraska ranges from 6 to 10 feet thick and locally has a depth of 50 feet or more. The age of the beds was believed to be Tertiary and Pleistocene. The material is a practically pure rhyolite tuff, that is it corresponds in composition to a siliceous igneous rock. It was called pumicite and found some industrial application by reason of its heat insulating properties.

**ORIGIN OF DOLOMITE.** The use of staining solutions in bringing out the relations of calcite and dolomite was advocated by E. Steidtmann in a paper which also attacked the problem of the derivation of dolomite. The process of dolomitization in many instances involved replacement and this might operate locally without regard to openings like those afforded by joints and bedding planes. It is held that most dolomites were formed in the sea before the consolidation of the carbonate materials, but underground circulations are responsible in part for the conversion of limestone to dolomite.

**PLASTICITY AND FLOWAGE OF ROCKS.** The effects of plastic yielding and flowage are frequently to be observed among those rocks which at one time were deeply buried in the earth. It would appear that under the conditions of cubic compression which obtain at depths in the earth's crust, assisted no doubt by the heat incident to the temperature gradient, hard rocks lose their rigidity and accommodate themselves to strain by movement in one form or another. The relative pressures necessary to produce such movement and the methods of accommodation are not determinable, of course, by direct observation, and the only information to be had is through the avenue of laboratory experimentation. F. D. Adams and J. A. Bancroft contributed some results of an investigation on the artificial deformation of rocks, in continuation of the work which the former had had under way for several years. It was found that all the rock varieties used in the experiments, inclusive

of such hard materials as granite and diabase, could be deformed by differential pressure at ordinary temperatures and that the ease of deformation for each variety depends upon the hardness of the component minerals. In the softer rocks, like alabaster, steatite, and marble, deformation is produced by movements within the crystal particles along gliding planes: in the harder materials it is accompanied by granulation. Applying the laboratory data to the behavior of rocks in the earth's crust, it is noted that the stress necessary to cause deformation increases rapidly with the load, that is with the depth below the surface. This is important, for it shows that a uniform side thrust might result in the folding and deformation of the upper layer and yet not suffice to produce movement in the lower part of the same mass. Consequently, it seems reasonable to suppose that flowage in rocks takes place at moderate depths rather than in the very remote regions of the crust. The investigation seems to have an important bearing on the principle of isostasy as interpreted by some of its adherents.

**ISOSTASY.** The latest volume of the series of the United States Coast and Geodetic Survey publications relating to this subject gave the results of gravity determinations over a larger area than heretofore covered and was by so much enlarged in scope. The data were assembled by William Bowie from 219 stations in the United States, 42 in Canada, 73 in India, and 40 in other countries. The conclusions tend to confirm the deductions which were based on the earlier studies. The hypothesis of isostasy, as may be explained, implies that every topographic feature is balanced by a corresponding variation in density of the underlying column of rock down to a uniform level—the level of isostatic compensation. Thus, every unit column contains the same mass. Bowie in his recent work referred to placed the depth of compensation for the United States as a whole at 60 kilometres; for mountainous regions by themselves the value is 111 kilometres and 95 kilometres, respectively, according to somewhat different assumptions. The best value for the depth seems to lie between 97 kilometres, the mean of Hayford's determinations, and 95 kilometres which is the accepted value for mountainous regions. In a criticism of the conclusions of Hayford as to the depth and rate of compensation, W. D. McMillan expressed the view that these matters were still unsettled, inasmuch as they were partly based upon assumptions not capable of determination. Any one of the following four possibilities would seem to fit in with the observed data: uniform compensation, uniformly decreasing compensation, compensation in a subterranean layer, and the Chamberlin method of compensation. And there is a possibility that some other non-isostatic principle may yet be discovered that will apply equally well to the above. The virtue of the theory in its present form is that it lays down a definite scheme for coördinating the variations of density.

**ECONOMIC GEOLOGY.** *Oil-shales.* The great resources of oil-bearing shale that occur in the United States are attracting some attention, although as yet they have not been economically developed. They constitute a resource for the future, after the more easily obtained oil from wells no longer suffices to meet the demand. A

summary of the more important deposits was presented by D. E. Winchester of the United States Geological Survey. The shales are found in various geological formations that range from Devonian to Tertiary in age. The Green River beds (Eocene) of Colorado, Utah, Wyoming, and Nevada afford the richest material thus far discovered, comparing favorably in oil content with the oil-shales of Scotland and France. It is estimated that an area of 5300 square miles is underlain by beds thick enough to mine and rich in oil; at many places they are 100 feet thick in the aggregate and their content of oil runs as high as 55 gallons or more to the ton. The origin of the oil is traced to the abundant plant life of the time, rather than from distillation of animal remains which are much less in evidence. At any rate there seems to be no doubt that the oil is indigenous to the shale and has not migrated into its place as maintained by some writers. The oil recovered by distillation in a retort exists partly as such and in part is produced by the breaking up of the organic compounds during the process. Besides oil there is produced ammonia, in addition to noncondensed gases of value. The shales of Carboniferous age from the coal mines of Kentucky, Illinois, and western Pennsylvania show good tests. The Devonian shales of the eastern United States are relatively low grade, their yield not exceeding 20 gallons to the ton.

**THE MAGMATIC ORIGIN OF SULPHIDES.** The occurrence of metallic sulphides in direct association with the igneous rocks and in bodies which lack the characteristics of open-fissure fillings or veins is a form of ore-deposit about which centred considerable controversy. A well-known example of the kind is the nickel-copper deposits of Sudbury, Canada, which furnish most of the world's nickel supply. In the earlier studies of the district by L. Walker, A. E. Barlow, and A. P. Coleman it was recognized that the deposits are found along the edges of an intrusive sheet of norite (a basic igneous rock) and that the relations between the ores and the containing rocks in many placers are in contrast with those presented by veins. Coleman has given a very detailed account of the geology of the ore-bodies and presented therein much evidence in favor of the view of a magmatic derivation of the sulphides. According to his explanation the ores have accumulated in most places by gravity segregation, although in some instances subsequent rearrangement may have taken place through the operation of underground solutions. This theory finds a parallel in the undoubted segregation of oxide ores in the igneous rocks, and the main objection to its application seems to arise from the rather sparse distribution of sulphides in most igneous rocks, whereas the oxides of iron, titanium, and a few other metals are not uncommon. In the monographic report of the Royal Ontario Nickel Commission C. W. Knight ascribed the Sudbury ores to the process of hydrothermal replacement, basing his conclusions largely upon microscopic evidence of the relations of the sulphide minerals. A. M. Bateman in an independent paper subjected both theories to criticism. He advocated magmatic derivation as the best explanation for some of the occurrences, but finds that most of the bodies have resulted from intrusion of igneous

rock heavily charged with sulphides. The hydro-thermal process seems applicable in individual instances.

**GEORGETOWN UNIVERSITY.** A Roman Catholic institution for the education of men, at Washington, D. C. In the fall of 1917 there were 1117 students and 162 members of the faculty. Volumes in the library numbered 136,000. The class of 1869 gave a fund of \$125,000 to the university in 1917. Georgetown was founded in 1789. President, Very Rev. Alphonsus J. Donlon, S.J.

**GEORGE WASHINGTON UNIVERSITY.** A non-sectarian co-educational institution at Washington, D. C. There were 2194 students registered in the several departments during the year 1916-17 and there were 252 members of the faculty. Volumes in the library numbered 50,500. Productive funds amounted to \$161,413.96 and the income therefrom in 1917 to \$6,496.41. During 1917 \$5127.47 was received toward the law school building fund and there were other gifts of a miscellaneous character. George Washington was founded as Columbian University in 1821. President, Charles Herbert Stockton, LL.D.

**GEORGIA, POPULATION.** The population of the State in 1910 was 2,609,121, and on July 1, 1917, it was estimated to be 2,895,841.

**AGRICULTURE.** The acreage, production, and value of the principal crops as estimated by the United States Department of Agriculture in 1916-17 were as follows:

	Acreage	Prod. Bu.	Value
Corn .... 1917	4,500,000	72,000,000	\$115,200,000
1916	4,000,000	62,000,000	62,000,000
Wheat ... 1917	244,000	2,074,000	6,015,000
1916	334,000	3,808,000	7,083,000
Oats .... 1917	650,000	10,400,000	12,168,000
1916	880,000	16,770,000	13,248,000
Rice .... 1917	900	27,000	53,000
1916	800	18,000	14,000
Potatoes . 1917	19,000	1,596,000	3,112,000
1916	15,000	900,000	1,575,000
Hay .... 1917	535,000	a 562,000	11,240,000
1916	400,000	460,000	7,452,000
Tobacco . 1917	1,800	b 1,600,000	912,000
1916	1,300	1,584,000	414,000
Cotton ... 1917	5,028,000	c 1,820,000	262,080,000
1916	5,277,000	1,821,000	181,183,000

a Tons. b Pounds. c Bales of 500 pounds gross weight.

**MINERAL PRODUCTION.** The production of coal in the State in 1916 was 173,554 net tons, valued at \$310,093, compared with 134,496 net tons, valued at \$231,861 in 1915. The production of iron ore in 1916 was 252,143 gross tons, valued at \$413,259, compared with 101,719 gross tons, valued at \$186,083 in 1915. The production of barytes in 1916 was 104,784 short tons, valued at \$401,295, compared with 31,027 short tons, valued at \$102,825 in 1915. The production of bauxite in 1916 was 40,388 long tons, valued at \$239,089.

**TRANSPORTATION.** The total railway mileage in 1915, the latest year for which statistics are available, was 7295 miles of single main track.

**FINANCE.** The statistics for finance are not available for a later year than 1915. On January 1, of that year there was a balance in the treasury of \$787,455. The receipts for the year amounted to \$10,158,134, and the disbursements amounted to \$10,102,791, leaving a balance in the treasury on January 1, 1916, of \$842,799.

The total bonded indebtedness of the State amounted to \$6000.

**EDUCATION.** The statistics for 1916 are the latest available. The total number of children of school age in the State in that year was 795,484. The total enrollment was 659,548, and the average daily attendance was 452,157. The total number of school houses in the State was 7894. The value of school property was \$15,048,919. The total number of teachers was 14,831. The average monthly salary paid to white males was \$61 and to white females was \$46. That paid to colored male teachers was \$30.70 and to colored female teachers was \$22.

**POLITICS AND GOVERNMENT.** There were no general elections in the State during 1917. A special election was held in the fourth Congressional District as a result of the resignation from Congress of Judge W. C. Adamson. W. C. Wright was elected to succeed him. In the eighth Congressional District, Judge Charles Brand succeeded Congressman Tribble, deceased. Judge B. D. Evans was appointed presiding judge of the Southern District of Georgia, U. S. Court and was succeeded on the State Supreme Bench by Judge Walter F. George of the State Court of Appeals, who in turn was followed in the Appellate Court by Judge Frank Harwell.

In the early part of the year, Governor Harris caused an official investigation of the lynching evil to be made. The findings of the investigation were to the effect that the State is grossly misrepresented and the condition exaggerated in the press of the country. During 1917 only two lynchings were reported in the State. The recruiting office of the United States army reports that from April 1 to December, 1917, 11,953 men had enlisted in the national service. A disastrous fire, on May 21, destroyed a considerable part of Atlanta. See article FIRE PROTECTION.

**LEGISLATION.** The most important acts passed by the legislature of 1917 are noted below.

A measure was enacted providing for the establishment and maintenance of agricultural schools. An act was passed designed to prevent desecration of the flag or national emblem of the United States. There was created a home guard or State constabulary.

An act was passed providing for primary election by political parties of candidates for certain offices by the county unit system. An agricultural, industrial, and normal school was established as a branch of the University of Georgia. A resolution was passed appointing a commission to draft a bill regulating the establishment of banks. The legislature passed a resolution endorsing the President of the United States and assuring him of the confidence and loyalty of the people of Georgia.

**STATE OFFICERS.** Governor, Hugh M. Dorsey; Secretary of State, Philip Cook; Treasurer, Wm. J. Speer; Comptroller, W. A. Wright; Attorney-General, Clifford Walker; Adjutant-General, J. Van Holt Nash; Superintendent of Education, M. L. Brittain; Commissioner of Agriculture, J. J. Brown—all Democrats.

**JUDICIARY.** Supreme Court: Chief Justice, Wm. H. Fish; Presiding Justice, Beverly D. Evans; Associate Justices, M. W. Beck, Samuel

\* Took office July, 1917, Dorsey succeeding Nat E. Harris, as Governor.

C. Atkinson, H. W. Hill, and S. P. Gilbert; Clerk, Z. D. Harrison.

**GEORGIA, UNIVERSITY OF.** A State educational institution located at Athens, Ga. In the fall of 1917 its enrollment, normally about 700, had been somewhat reduced because of the effect of war. Volumes in the library numbered 42,000. Productive funds amounted to about \$400,000. The university was founded in 1801. President, David C. Barrow, LL.D.

**GERARD, JAMES W.** See UNITED STATES AND THE WAR.

**GERMAN-AMERICANS.** See UNITED STATES AND THE WAR.

**GERMAN EAST AFRICA.** A protectorate of Germany extending from the Indian Ocean inland to Victoria Nyanza and lakes Tanganyika and Nyassa. It lies between the East Africa Protectorate (British) at the north and Portuguese East Africa at the south, the northern limit on the coast being the mouth of the Umba River and the southern being lat. 10°40' S., near Cape Delgado. The protectorate touches the Belgian Congo, Northern Rhodesia, and the Nyassaland Protectorate. Estimated area, 384,170 square miles. Estimated population, about 7,666,000. At the beginning of 1913, whites numbered 5336, of whom 4107 German. The natives consist mostly of tribes of mixed Bantu race. The capital is Dar-es-Salaam, chief seaport and terminus of the Central Railway. East Africa is the largest, most populous, and most valuable of the German oversea possessions. Germany established the protectorate in 1885, and in 1890 acquired the rights of the sultan of Zanzibar over a strip of coast territory by payment of 4,000,000 marks. In the great war German strength was greater and more persistent in East Africa than in any other protectorate.

The natives engage in agriculture and grazing to some extent, and German settlers have established plantations, mostly near the coast, which produce coconuts, tobacco, rubber, coffee, vanilla, cotton, sisal, cacao, etc. In 1912 there were 3,950,250 cattle and 6,398,300 sheep and goats reported as belonging to natives, and 43,617 cattle and 41,647 sheep and goats to whites. Imports and exports in 1913 were valued at 53,358,000 and 35,550,000 marks respectively; about half the trade was with Germany. Principal exports in 1912 and 1913 respectively: sisal, 7,359,000 and 10,710,000 marks; rubber, 8,426,000 and 6,567,000; hides and skins, 4,067,000 and 5,591,000. There are two railway lines, with nearly 1000 miles of track. The Usambara Railway, with 219 miles of track, runs from Tanga, a northern seaport, to Muhesa, near Mount Kilimanjaro. The Central, or Tanganyika, Railway, with 777 miles of track, connects Dar-es-Salaam with Lake Tanganyika via Mpwapwa, Kilimatinde, Tabora, and Ujiji. During the occupation of the country by British and Belgian forces, the Central Railway was closed for trade purposes. But toward the end of 1917 it was announced that all towns on the line between Dar-es-Salaam and Tabora (530 miles) would be reopened to trade January 1, 1918. The northern part of the protectorate had already been reopened to trade. Dar-es-Salaam has telegraphic communication with Zanzibar, the coast towns, and various inland centres, and, at Ujiji, with the African trans-continental line. Reported number of telegraph stations, 34; post offices, 51. There are several

radiotelegraph stations. The budget for 1915-16, as well as that for 1914-15, balanced at 61,271,000 marks; the estimated revenue consisted of 20,471,068 marks local receipts, 3,300,000 marks imperial contribution, and 37,500,000 marks loan.

**HISTORY.** Upon the withdrawal of Gen. Smuts to attend the special session of the war cabinet in England the command in East Africa was given on January 20 to Lieut. Gen. A. R. Hoskins who had been the commander of the first three divisions under Gen. Smuts. According to official announcements the Germans in the Mahenge region were retiring southward before the advancing columns of Brig. Gen. Northey. From this time on in the autumn the small, but obstinately resisting German forces were gradually crowded back by the British and cooperating Belgian troops into the Mahenge region. On October 10, it was announced that the Belgian force had occupied Mahenge; between October 23 and November 8 the British columns drove the enemy eastward capturing prisoners and munitions, and by the last week in November the German forces were cleared out of the country. The campaign terminated on November 27 with the surrender of a German force and considerable body of natives. Thus the last German colony in Africa to hold out passed into the hands of the Entente Allies.

**GERMAN EVANGELICAL SYNOD OF NORTH AMERICA.** Congregations of this denomination are to be found in practically all the States of the Union, though they are most numerous in the Central and North Central States. There were in 1917 approximately 1100 ministers, 1400 churches, and 275,000 communicants. The value of the church property is estimated at \$1,500,000 and over \$1,000,000 a year is contributed for the maintenance of churches. Missions are carried on in India where there are over 4000 adherents. The Eden Publishing House, the official publication agency of the denominations, is in St. Louis, Mo., and there is a branch in Chicago. There are five periodicals published at St. Louis, besides Bible lessons and Sunday School helps. The Eden Theological Seminary is maintained at St. Louis, a college at Elmhurst, Ill., and Fort Collins Seminary. There are also charitable institutions for superannuated ministers, for the widows and orphans of deceased ministers, and for orphans.

**GERMAN LITERATURE.** That the world's greatest war would at the end affect the literary production of Germany and Austria was to be expected. But as even so exact a science as that of statistics can in the hands of efficient camoufleurs be employed to hide and to pervert the truth, the decrease in book publication in Germany cannot be stated in bald numbers, but must rather be inferred from random remarks in unofficial communications. Glimpses of the real conditions can be obtained through the medium of those who have not been swept off their feet by the epidemic of national megalomania and have retained their independent judgment regardless of imperative suggestions from those in authority. Such a voice in the wilderness is Hermann Hesse, who, having settled in Switzerland some time before the war, secured for himself a perspective, which his colleagues within the German borderlines were lacking. He has freely expressed his views in the *Zürcher Zeitung* and other Swiss publications, and when

in the course of the past year the *Frankfurter Zeitung* was struck by the decrease of poetical production and solicited an explanation from the poets themselves. Hesse began his reply with the following remarks: "Of course the best among us are silent. Is that at all surprising? Do you want them to edit reports? I, for my part, am incapable of it." Such data as could be obtained through Swiss sources—German books and periodicals no longer reaching this country—show indeed a marked diminution in works of fiction and verse, while the drama seems to be less affected.

**FICTION.** There was a time when of the two brothers, Thomas and Heinrich Mann, the latter was spoken of as the less talented. The reason for this was obvious; for Thomas appealed to the larger class of German readers by his powerful and sympathetic pictures of Hanseatic characters and *milieu*, while Heinrich, the finer and broader mind of the two, secured from his very début a steadily increasing circle of admirers among critics with the larger European view. Thus it was natural that Heinrich Mann should become a valued contributor to the *Forum*, a periodical founded by Wilhelm Herzog to voice human thought *vs.* narrow Pan-German sentiment, and promptly suspended for doing so. But this did not in the least affect the creative spirit of Heinrich Mann, who has since published several notable books. The most recent is a story of political and social conditions, *Die Armen*, which has been compared with Victor Hugo's *Les Misérables*, and is bound to rank among the leading novels produced since the war. It is a powerful picture of contemporary life, from so lofty a standpoint as to be of lasting significance, and it is bound to outlive the works of many writers hitherto ranked higher in German letters, not excepting Thomas Mann. Compared with that book, the latest work of Arthur Schnitzler, the sentimental story of a physician in a health resort, *Dr. Grastor, Kurarzt*, is a very weak production. Paul Ilg's *Der starke Mann* suggests by its title a tribute to the popular idea of the over-man. Peter Nansen, one of the group of writers who owe their prominence to the patronage of S. Fischer, has written a story, *Die glückliche Ehe*, which could have been told in the few words of a French anecdote. The stories of Hertha Koenig, *Die kleine und die grosse Liebe*, and Maria Steinbach, *Eva Thörning*, are novels of sentiment. Volumes of short stories are more numerous. Foremost among them is the book by Karin Michaelis, *Opfer* (Victims), who, although she has allowed herself to be more or less adopted by the Germans, paints with gripping veracity the tragedies of the homeless thousands, who wander about the battlefields of Poland and other war-stricken portions of the Eastern Front, incapable of uttering a word beyond the heart-rending *Do domu*—"home!" That book has regained for her sympathies forfeited by the publication of her sensational sex-novel *The Dangerous Age*. Hermann Sudermann has turned to his native soil close to the borderline of ancient Lithuania and has written a volume of *Litauische Geschichten*. It would seem as if the literary life of Switzerland were profiting by the depressing conditions of the German book-market. Swiss publishers are busy bringing out new books and new editions by native writers. Of the former must be men-

tioned Max Pulver's two stories *Odil* and *Coelestine*, Felix Marti's volume entitled *Die Stadt*, Felix Bernab's *Geschichten und Träume*, and Alfred Huggenberger's volume of stories, sketches, and verse, entitled *Aus meinem Sommergarten*. A collection called *Schweizerische Erzähler* contains Ruth Waldstetter's record of an invalid life, *Tagebuch einer Leidenden*, stories by Robert Walser, Max Pulver, and others. Another collection of stories contains Paul Ilg's *Maria Thurnherr*, Meinrad Lienert's *Alte Liebesgeschichten*, Alfred Huggenberger's *Daniel Pfund*, Alfred Steffens's *Banz*, and Olga Amberger's *In der Glücksschaukel*. New editions of Felix Moeschlin's *Brigitta Roessler*, Joseph Reinhardt's *Geschichten und Bilder*, and Robert Jacob Lang's *Lone Wargeler* are also doing their share to remind the world of the existence of an indigenous Swiss literature.

**DRAMA.** The great names in contemporary German drama are missing among the records of the stage in 1917. The greatest success seems to have been achieved by Fritz von Unruh, previously known as the author of books of travel and a drama, *Die Heze*. The new play which created quite a sensation is *Das Geschlecht*, which envisages the future and contains this interesting episode: A Ulan at the Hohenzollern tomb conjures the spirit of Kleist and confesses his belief in "historical mutation,"—whatever that may mean to a German mind to-day. But the play has been compared with Georg Büchner's *Dantons Tod* and Gerhart Hauptmann's *The Weavers*. Much discussed also was Walter Hasenclever's *Der Sohn*, which had its first hearing in Zurich. Stefan Zweig, the gifted Austrian who interpreted with so much insight the work of the lamented Verhaëren, is the author of a poetical drama, *Jeremias*, which was given in Dresden. Heinrich Lilienfein, who made a promising début some years ago, has appeared with a *Hildebrand* which had a successful *première*. Lee Greiner, another writer who has courted dramatic success for some years, is the author of a renaissance drama, *Herzog Bocanero's Ende*, which had its initial performance in Dresden. Paul Ernst's *Manfred und Beatrice*, Paul Alexander's *Inez de Castro*, and Friedrich Seebrecht's *Saul* are among other ambitious efforts. Hans Ganz is the author of a tragedy, *Der Morgen*, which had a warm reception in Zurich. Georg Kaiser's *Die Versuchung*, with the sub-title *eine Tragödie unter jungen Leuten*, suggests the ever-popular sex-problem. Heinrich Abbe's *Arminius* by its very title sounded the patriotic note. Max Pulver's *Narkissos und Amazone* did its share to bring the name of the gifted Swiss writer to the fore. Oskar Bendiner's *Der Renegat* is spoken of as a political drama, but reports of its performance and character are lacking. Thaddäus Rittner's *Der Garten der Jugend*, Georg Kaiser's *Die Mutter Gottes*, Paul Kornfeld's *Die Verführung*, and Heinrich Schnabel's *Die Wiederkehr* were among other novelties of the season. An interesting performance was that of Karl Gjellerup's *Das Weib des Vollendeten*, which has for many years been available in book form. Another performance which created no little discussion was that of Oskar Kokoschka's plays, *Mörder, Iliad*, and *Der brennende Dornbusch* in Dresden. It did not, however, convince the audience that the talent of the poet-painter lies in the direction of the stage.

A number of one-act plays proved attractive; among them Heinrich Mann's *Der Unschuldige*, Hans Müller-Schlösser's three playlets *Dreierlei Liebe*, and the two plays *Der Schattenbaum* and *Die Stunde Vergessens* by Friedrich Jaksch. Pantomime plays are appearing more frequently. Among them are worthy of mention Karl Vollmoeller's *Venezianische Nacht* and Lion Feuchtwanger's *Pierrot's Horrentraum*.

Numerous comedies were produced during the year. Successful first performances were scored by Robert Saudeck's *Die Distel*, Rudolf Eger's *Das Bild ohne Gnade* and *Die grosse und die kleine Welt*, Fritz Friedmann Frederick's *Klubleute*, Karl Sternheim's *Perleberg*, August Neidhart's *Die Liebesinsel*, Martin Langen's *Der Kuss*, and Victor Fleischer's comedy of medical life, *Kollege Eisenhart*. Wilhelm Scharrelmann, who some years ago collaborated with Johannes Wiegand on *Krieg*—an anti-militarist drama which has been translated and performed in New York under the title *The Wages of War*, has turned to very light comedy in *Die Hochzeit in der Pickballe*. René Schickelé, the Alsatian, who at the beginning of the war had attempted to act as an interpreter of the dual soul of his people, has also turned to comedy, his *Hans im Schnackeloch* having been successfully performed in Munich. The revival of Georg Büchner's drama, *Dantons Tod*, would have been more significant, if it had taken place in a German city instead of Zurich.

**POETRY.** Few books of verse have appeared during the year. Max Pulver, whose *Selbstbegegnung* some time ago had won for him the interest of serious critics through the powerful reflection of a soul's struggle, published an epic: *Merlin*. Walter Hasenclever's *Tod und Auferstehung* is a book of thoughtful lyrical meditations. Bruno Frank's *Requiem* also strikes a timely solemn note. Julius Franz Schutz, on the other hand, has succeeded in *Die goldene Westfahrt* in holding aloof from reality; but the tone of the book is somewhat pretentious and artificial.

**BIOGRAPHY AND LETTERS.** The number of biographical works has been small as compared with that of other years. Wilhelm Dibelius is the author of a life of Charles Dickens, which was so far poorly represented in German literature. Thomas Mann, true to the Prussian spirit which animates him, has written a volume on Frederick the Great. Jules-Coulin, a Swiss writer, is the author of a life of Martin Disteli, the Swiss caricaturist. Emil Ermatinger, himself a novelist of unusual power, has published the third volume of Gottfried Keller's *Leben, Briefe und Tagebücher*, of which he is the editor. It contains a portrait and two pen-and-ink sketches by Keller. Etta Federn offers a contribution to the psychology of Goethe in her book *Christiane von Goethe*. Dr. Hans Gerhard Graef, one of the chief collaborators in the Goethe-Archiv in Weimar, has published *Goethe's Briefwechsel mit seiner Frau*, containing 354 letters of Goethe and 247 of Christiane Vulpius. J. Plotke has published the correspondence between Theodor Storm and Paul Lindau. Paul Lindau's *Erinnerungen* is a memoir of no little value; for although the facile pen of the author was ever more that of a journalist and can hardly make claim to seriousness and thoroughness, he records childhood memories of 1848, he has lived through the wars of 1866 and 1870, and

has been a commentator upon his time in periodicals as in books.

**CRITICISM.** The most ambitious work of literary history and criticism published during the year is Dr. Max Hecker's *Namen-Verzeichniss zu Goethes Werken*, an alphabetical index with commentaries covering all the names mentioned in the works of Goethe. Another work of formidable scope is Dr. Julius Zeitler's *Goethe Handbuch*, being the first part of a Goethe Dictionary, in the compilation of which the editor has the assistance of thirty-six collaborators. The *Goethe-Jahrbuch* is of less limited appeal; it contains articles on Goethe's theory of color, his attitude towards music, and his relations to foreign countries. In that last article, the author, M. Wable, makes a point to emphasize Goethe's sympathy for the French and gives an exhaustive survey of his correspondence and intercourse with foreign men of note. Albert Koester has published seven lectures on Gottfried Keller. Prof. R. Unger has written an interesting volume entitled *Weltanschauung und Dichtung*. Carl Spitteler, the Swiss poet, who by his decided allegiance to the cause of the Entente Allies has won the sympathy of the French, is being much written about in both languages. Jean Edouard Spénlé's book *Carl Spitteler l'homme et le poète*, limns his personality. Hermann Ganz, a Swiss writer, offers a stimulating book in *Aesthetische Studien zu Spitteler's Olympischem Frühling*. Ricarda Huch, poet, novelist, critic, and historian, has published an appreciation of Goethe, the pioneer of the village story in *Jeremiah Goethe's Weltanschauung*. Adolf Frey has published *Conrad Ferdinand Meyer's Unvollendete Prosadichtungen* in two volumes, the first containing fragments and commentaries, the second manuscripts in facsimile.

**HISTORY.** Books on history have been fewer in number than any other class of literary production. A. Stern, the author of a *Geschichte Europas*, has published the seventh volume, which covers European history from 1848 to 1870. Theodor Lindner's *Weltgeschichte seit der Völkerwanderung* has reached its ninth and last volume, which brings it up to the present. Johannes Dierauer, is the author of a *Geschichte der schweizerischen Eidgenossenschaft* which covers Swiss history to the year 1848.

**MISCELLANEOUS.** An interesting book of travel has been written by Hans Bloesch: *Tunis*. Valuable information about the Czech people is contained in Dr. Zd. V. Tobolk's *Das böhmische Volk*. A work by Walter Koch and Max Hodann, dealing with the *Burschenschaften* of a hundred or more years ago, is called *Die Urburschenschaft* and contains an epilogue by Hans Mühlstein, in which occurs this significant passage: "Help to make way for the European idea, as you made way a hundred years ago for the German." Of course the output of books on the war has been enormous. It seems meet to notice a few of the most important, especially where they voice dissent from the Pan-German keynote. Simultaneous with the foundation of the *Forum* by Wilhelm Herzog, which was quickly suppressed, there had been organized a group of men who called themselves *Neues Vaterland*, among them Prof. Rudolf Goldscheid, the Viennese sociologist, Walter Schücking, and Kurt Eimer. Pamphlets written by them have been circulating in Switzerland. Dr. Alfred Fried, the pacifist, has also vigorously condemned the

Hohenzollern policy. He is the author of a work in two volumes: *Der Kampf um Vermeidung des Weltkriegs*. The Swiss historian Zurlinden has published *Der Weltkrieg: Vorläufige Orientierung vom schweizerischen Standpunkt aus*, in which occurs a passage applicable to the Kaiser's elastic Christianity: "Honor to the representatives of the churches of Berne and Zurich, who resolutely reject any compromise between the morals of war and those of Christianity." Mme. Annette Kolb, a writer and lecturer of German-French parentage, who at the beginning of the war created a sensation by accusing the German press of having systematically stimulated national antagonisms, has published her papers on the subject under the title *Briefe einer Deutsch-Französin*. But the most important work of this kind is the latest volume of Hermann Fernau, who by his *Because I am a German* has opened many eyes that would not see before. It is entitled *Durch . . . zur Demokratie*. Walter Rathenau, the great industrial and commercial authority, represents the opposite standpoint at its worst. His volume on the economic problems of the peace to come is likely to be uncompromisingly Pan-German in spirit. Of Gustav Eberlein's *Deutschland im Kriege* and Max Müller's *Frankreich im Kriege* little is known beyond the titles.

**NEW EDITIONS.** Of Hermann Oldenberg's *Religion der Veden*, first published in 1894, a second edition has been issued. Rudolf Hunzicker has brought out a new edition of Jeremiah Gottlieb's *Jakob's Wanderungen durch die Schweiz*. Pocket editions of works by Gottfried Keller, Carlos Strasser, and Conrad Falke have been put on the market.

**NECROLOGY.** Death has removed two more authorities on English literature who had done valuable work in Germany. Emil Koeppel, who specialized in Elizabethan drama and had written on Chapman, Ford, and Massinger, ranked close after Ernst Sieper, whose loss was recorded in the **YEAR BOOK** for 1916. K. Bulbring was the other student of English letters who cannot now be easily replaced. Karl Engelberger, the Swiss poet and novelist, died August 11. Dr. Johann Friedrich, a great authority on ecclesiastical history, died during the year. One of the most interesting personalities in German letters was Lady Blennerhassett, a Bavarian by birth, married to an Irishman. She was one of the foremost representatives of the European spirit in German literature. Among her many works are books of a biographical and critical character on Madame de Staël, Talleyrand, Chateaubriand, d'Annunzio, Cardinal Newman, and others.

**GERMAN NEW GUINEA.** A protectorate of Germany, consisting of Kaiser-Wilhelmsland (the northeastern part of the island of New Guinea), the Bismarck Archipelago, and the German Solomon Islands. The seat of government is Rabaul, on the island of Neu-Pommern. The estimated area is 240,000 square kilometres (92,664 square miles). Kaiser-Wilhelmsland has an estimated area of 70,135 square miles, including Long Island, Dampier Island, and other small islands. Dependencies of German New Guinea are the Caroline, Palau, Marshall, and Mariana islands, excepting Guam. Guam is the largest of the Mariana islands (Ladrones) and belongs to the United States. The area of the dependencies is stated at 2476 square

kilometres (956 square miles). The estimated population of German New Guinea and dependencies is over 600,000; at the beginning of 1913, whites numbered 968, of whom 746 German. Germany declared a protectorate over Kaiser-Wilhelmsland and the Bismarck Archipelago in 1884 and acquired the Micronesian dependencies from Spain in 1899. The protectorate was occupied by Australian troops in September and October, 1914, and has since been under Australian military administration. In October, 1914, the Caroline, Palau, Marshall, and Mariana islands were taken by the Japanese, who have since administered them.

The imports and exports of German New Guinea in 1912 were valued at 5,872,000 and 5,041,000 marks respectively. The chief export is copra, valued at 4,052,000 marks in 1912. Imports and exports of the dependencies in 1912, 3,335,000 and 7,046,000 marks. The leading export of the dependencies is phosphate, valued at 4,991,000 marks in 1912; copra, 1,958,000 marks. Imports from Germany to the protectorate and dependencies in 1912, 3,177,000 marks; exports therefrom to Germany, 6,480,000 marks.

For protectorate and dependencies, the budget for 1915-16, as well as for 1914-15, balanced at 3,833,886 marks, the estimated receipts including an imperial contribution of 1,717,022 marks.

**GERMAN PROTECTORATES.** The overseas possessions of Germany were acquired between 1884 and 1900. After the outbreak of the great war in 1914 they were attacked and conquered by forces of the Allies. Resistance was most prolonged in German East Africa, the conquest of which was completed by December, 1917. The estimated area of the German protectorates aggregates about 1,140,000 square miles, which is about three-eighths of the area of Continental United States, or about five and one-half times the area of Germany. Of the total area, over nine-tenths is in Africa. The population of many districts is conjectural, but the total number of colored inhabitants was estimated before the great war at 13,258,000. The reported white population at the beginning of 1913 was 28,846, of whom 23,952 German; about half the whites (that is 14,830, of whom 12,292 German) were in German Southwest Africa. The following table shows the protectorates, the year of their establishment, their estimated area, and the estimated number of colored inhabitants:

	Year	Sq. mi.	Pop.
East Africa .....	1885	384,170	7,661,000
Kamerun .....	1884	305,019	3,641,000
Togo .....	1884	83,668	1,032,000
Southwest Africa ....	1884	322,432	84,000
Total Africa .....		1,045,289	12,428,000
New Guinea .....	1884	92,664	602,000
Caroline, Marshall, Palau, Mariana Islands .....	1899	956	
Samoa .....	1900	994	88,000
Total in Pacific...		94,614	640,000
Kiaochow .....	1898	213	190,000
Grand total .....		1,140,117	13,258,000

The total imports in 1912 were valued at 263,933,000 marks, and the total exports at 200,520,000 marks. In 1912 and 1913 respec-

tively, the imports to the African protectorates amounted to 128,478,000 and 142,031,000 marks; exports therefrom, 103,748,000 and 144,141,000 marks. The figures for total trade include imports to and exports from Kiaochow in the fiscal year 1912-13, amounting to 121,254,000 and 79,640,000 marks respectively. Accordingly the imports and exports of the other protectorates in 1912 were 142,679,000 and 120,880,000 marks respectively; of these, imports from Germany aggregated 88,460,000 marks, and exports thereto 84,946,000 marks.

For the fiscal year 1916, estimated revenue and expenditure of the protectorates balanced at about 179,909,000 marks. The estimated receipts included: local revenue, 78,495,000 marks; imperial contribution, 29,312,000; loans, 60,214,000. Prior to the conquest by the forces of the Allies, each of the protectorates was administered by an imperial governor. Further details may be found in the article GERMAN PROTECTORATES in the 1916 volume of the YEAR BOOK and in the articles on the several protectorates in that volume and the 1915 volume; see also the articles in this book on GERMAN EAST AFRICA, GERMAN NEW GUINEA, GERMAN SAMOA, GERMAN SOUTHWEST AFRICA, KAMARUN, KIAOCHOW, Togo.

**GERMAN REFORMED CHURCH.** See REFORMED CHURCH IN THE UNITED STATES.

**GERMAN SAMOA.** A protectorate of Germany, consisting of a portion of a group of Polynesian islands in about lat. 14°S. Samoan islands east of long. 171°E. belong to the United States; those west of that meridian constitute the German protectorate. The area of the protectorate is about 994 square miles, including Savaii (652.9 square miles), Upolu (335.5), Manono (3.3), and Apolima (1.8). The population is about 40,000. Whites in 1914 numbered 600, of whom 373 German. The population includes over 2000 Chinese. Administrative headquarters, Apia, in Upolu. The protectorate was established in 1900; it has been administered by the Dominion of New Zealand since August 29, 1914, when a New Zealand force captured Apia.

In 1913 imports and exports were valued at 5,676,000 and 5,339,000 marks respectively, imports from Germany being 1,199,000 marks and exports thereto 2973. The chief export is copra, amounting in 1913 to 4,121,000 marks; cacao, 1,063,000 marks. Exports in 1915 are reported at £262,389. In 1915 there were entered at Apia 72 vessels, of 63,151 tons (exclusive of coasters and ships of war); of these, British vessels numbered 51, of 56,133 tons. Regular steamship communication is maintained with New Zealand. There is a radiotelegraph station at Apia. Reported revenue for the year ended March 31, 1916, £68,663; expenditure, £66,764.

**GERMAN SOUTHWEST AFRICA.** A protectorate of Germany on the Atlantic, extending south from Angola (Portuguese) to the Cape Province of the Union of South Africa. It does not include the small territory of Walffish Bay, which belongs to the Cape Province. The protectorate extends inland to Northern Rhodesia, the Bechuanaland Protectorate (British), and British Bechuanaland, which is the northern part of the Cape Province; and thus it includes the countries known as Damaraland and Namaqualand. Estimated area, 322,432 square miles. The southern part of the protectorate and much of the east are virtually

desert. There are various estimates of the number of inhabitants, but it is agreed that the population is very sparse. Some of the native peoples are diminishing in number. A German estimate made shortly before the outbreak of the great European war placed the total at about 99,000. The natives include Bushmen, Hottentot, Herero, Damara, and Ovampo, the last being the most numerous. Whites on January 1, 1913, numbered 14,830, of whom 12,292 German. The number of Germans, as well as of all whites, was a little more than half the number in all the German protectorates. The capital is Windhuk, which is situated in the centre of the country and has rail connection with Swakopmund and Walffish Bay and with the railway system of the Union of South Africa. The protectorate of Southwest Africa was established by Germany in 1884. After the outbreak of the great war it was invaded by South African forces under Gen. Louis Botha, who completed its conquest in July, 1915. Since then it has been administered by the Union of South Africa. In commenting upon the "war aims address" of Lloyd George, the British prime minister, at the close of the year, Henry Burton, minister of finance for the Union of South Africa, was quoted as saying: "We welcome the reference to the German colonies. It is difficult to exaggerate the feeling in South Africa over any prospect of return of the Southwest Protectorate to Germany, if any concessions are eventually made to German colonization. We can never tolerate her as a neighbor again, especially after the revelations of this war, regarding her purposes and methods."

Much of the country is dry and barren, and agriculture is only slightly developed. Where pasturage is sufficient, stock raising is of some importance. Reported number of cattle in 1913, 205,643; wool sheep, 53,691; mutton sheep, 472,585; Persian sheep, 11,194; goats, 485,401; Angora goats, 31,503. Copper is mined, especially in the Taumeb and Grootfontein districts, colored marble is worked at Karibib, and diamonds are found in large numbers near Lüderitzbucht. The diamonds are small, but fetch good prices: up to the end of 1913 over 4,690,000 carats had been produced. Imports and exports in 1913 were valued at 43,426,000 and 70,302,000 marks respectively. About half the trade was with Germany. Chief exports in 1913: uncut diamonds, 58,910,000 marks (202,833.58 grams); copper ore, 7,929,000 marks (47,345 metric tons); tin ore, 632,000 marks (209 metric tons); hides and skins, 521,000 marks (345 metric tons); meat and meat products, 159,000 marks; small live stock (as sheep and goats), 144,000; wool, 136,000.

The railways have a total trackage of over 1550 miles, including 147 miles of government railway not in operation and 88 miles of private railway. Railways in operation include the following: Swakopmund to Windhuk, 237 miles; Windhuk to Nakob (on the Cape border), about 540 miles; Seeheim Junction to Lüderitzbucht, about 200 miles; Karibib (on the Swakopmund-Windhuk line) to Otavi, Taumeb, and Grootfontein, about 310 miles. The portion of the Windhuk-Nakob line which connects Kalkfontein with Nakob is a part of the line built by the British for military purposes after the outbreak of the great war, connecting the railway system of

the Union of South Africa with the German railways. This railway, beginning at Prieska in the Cape Province and terminating at Kalkfontein is 314 miles in length, the greater part of this distance being in the Cape Province; it was begun September 7, 1914, and completed June 25, 1915. On July 31, 1915, a 12-mile line was completed between Krantzberg and Karibib, thus putting Walfish Bay in rail communication with the Cape system. Reported length of telegraph line, 2457 miles.

The budget for 1915-16, as well as the budget for 1914-15, showed estimated revenue of 47,820,875 marks and estimated expenditure of 47,820,338 marks; estimated local receipts were 28,199,450 marks, imperial contribution 12,140,013, and loan 7,480,865.

See SOUTH AFRICA, UNION OF.

**GERMANY.** The German Empire is a constitutional monarchy of central Europe, consisting of 25 federated states and an imperial territory (Reichsland). The dominant state is the Kingdom of Prussia, which comprises about 64.5 per cent of the area of the empire and at the last census (1910) had about 61.9 per cent of the population; and, under the imperial constitution, the King of Prussia is German Emperor. The capital of both the empire and Prussia is Berlin.

**AREA AND POPULATION.** The area of the German Empire is stated officially at 540,857.5 square kilometres, exclusive of the Baltic and North Sea lagoons and the German part of the Lake of Constance. The equivalent in square miles is 208,825.2; this is a little larger than France (207,129 square miles) or Iowa, Missouri, and Kansas combined (207,725 square miles). The population, as calculated for June 30, 1914, a month before the outbreak of the great war, was 67,810,000.

The last German census was taken December 1, 1910. By states the population according to that census and according to the census of December 1, 1900, together with the area, is shown in the table below. Political status is indicated by the letters following the names: K kingdom, G.D. grand duchy, D duchy, P principality, FC free city, R Reichsland.

States	Sq. m.	Pop. 1900	Pop. 1910
Prussia (K) . . . .	184,683.9	34,472,509	40,165,219

The population of the territory now embraced within the empire was 24,833,000 in 1816; in 1850, 35,397,000; in 1864, 39,392,000; in 1871, 41,058,792; in 1880, 45,234,061; in 1890, 56,367,178; in 1905, 60,641,489. From 1905 to 1910, the population increased 7.1 per cent; from 1871 to 1910, 58.1 per cent. The average density per square mile in 1871 was about 197; in 1910, about 311. At the 1910 census males numbered 32,040,166, and females 32,885,827. In 1910, unmarried males and unmarried females numbered 19,516,340 and 18,591,604 respectively; married males and married females, 11,608,028 and 11,621,685; widowed, 866,676 and 2,583,872; divorced or separated, 49,122 and 88,666.

Communes having less than 2000 inhabitants are regarded as rural. The aggregate population of such communes in 1871 was 63.9 per cent of the total; in 1900, 45.6 per cent; in 1910, 40.0 per cent. The aggregate population of communes having 100,000 or more inhabitants in 1871 was 4.8 per cent of the total; in 1900, 16.2 per cent; in 1910, 21.3 per cent. At the 1910 census, there were 48 communes with over 100,000 inhabitants each, and 576 with over 10,000 each. Of the 48 large communes, 33 are in Prussia, 4 in Saxony, 3 in Bavaria, 2 in Baden. At the 1910 census, the population of Berlin was 2,071,257 (Greater Berlin, 3,710,000); the population of Berlin as calculated for September 1, 1916, was 1,779,107. Communal populations of over 150,000 were as follows in 1910: Berlin, 2,071,257; Hamburg, 931,035; Munich, 596,467; Leipzig, 589,850; Dresden, 548,308; Cologne, 516,527; Breslau, 512,105; Frankfurt am Main, 414,576; Düsseldorf, 358,728; Nuremberg, 333,142; Charlottenburg, 305,978; Hanover, 302,375; Essen, 294,653 (1916 estimate, 463,481); Chemnitz, 287,807; Stuttgart, 286,218; Magdeburg, 279,629; Bremen, 247,437; Königsberg, 245,994; Neukölln (formerly Rixdorf), 237,289; Stettin, 236,113; Duisburg, 229,483; Dortmund, 214,226 (1916 estimate, 282,214); Kiel, 211,627; Mannheim, 193,902; Halle, 180,843; Strassburg, 178,891; Berlin-Schöneberg, 172,823; Altona, 172,628; Danzig, 170,337; Elberfeld, 170,195; Gelsenkirchen, 169,513; Barmen, 169,214; Posen, 156,691; Aachen, 156,143; Cassel, 153,196.

At the 1910 census, Evangelicals numbered 39,991,421; Roman Catholics, 23,821,453; other Christians, 283,946; Jews, 615,021; others, 214,152. The following table shows, for the more important states and for the empire, the number of Evangelicals (E), of Roman Catholics (R. C.), of other Christians (O. C.), and of Jews (J.) per thousand inhabitants according to the 1910 census:

	E.	R.O.	O.O.	J.
Prussia . . . . .	618.2	363.1	4.7	10.4
Bavaria . . . . .	282.1	706.1	2.0	8.0
Saxony . . . . .	940.5	49.1	5.3	3.7
Württemberg . . . .	685.6	303.6	5.3	4.9
Baden . . . . .	385.6	593.2	0.2	12.1

	<i>H.</i>	<i>R.O.</i>	<i>O.O.</i>	<i>J.</i>
Hesse .....	661.5	310.1	5.2	18.8
Mecklenburg-Schwerin .....	961.8	32.9	2.0	2.2
Saxe-Weimar .....	944.0	47.9	2.0	3.2
Mecklenburg-Strelitz .....	953.7	40.0	3.3	2.4
Oldenburg .....	769.4	222.6	3.3	3.2
Brunswick .....	939.0	52.4	3.6	3.6
Hamburg .....	916.3	50.3	4.2	19.2
Alsace-Lorraine .....	217.8	762.2	2.1	16.3
German Empire .....	615.9	366.9	4.4	9.5
German Empire, 1900.....	625.0	361.0	4.0	10.0

The German birth rate of 42.6 in 1876 has never since been equaled. From 1881 to 1888 it stood at approximately 38.5; by the year 1900 it had declined to 37.0; and during the new century it has declined rapidly, reaching 28.3 in 1913. On the other hand, the death rate declined from 23.2 in 1900 to 15.8 in 1913. The largest number of births, 2,097,838, was in 1901; the largest number of deaths, 1,310,756, in 1893, the death rate in that year being 25.8; the largest surplus of births, 910,275, in 1906. Movement of the population for three years is shown in the following table:

	1912	1913	1914
Marriages .....	523,491	513,283	460,608
Births* .....	1,925,883	1,894,598	1,874,389
Stillbirths .....	50,247	55,845	55,793
Illegitimate births ..	177,056	183,857	.....
Deaths* .....	1,085,996	1,060,798	1,108,352
Surplus of births ..	839,887	833,800	766,037

\* Including stillbirths. † Excluding military casualties.

There has been no large German emigration in recent years. German overseas emigrants numbered 37,498 in 1895; 22,309 in 1900; 28,075 in 1905; 25,531 in 1910; 25,843 in 1913; 11,803 in 1914. Of the German overseas emigrants in 1913 and 1914, 19,124 and 9614 respectively were bound for the United States; 1306 and 580 for Canada; 140 and 77 for Brazil; 4814 and 1241 for other American countries; 359 and 232 for Australia; and 32 and 8 for Africa. Foreign overseas emigrants from German ports in 1913 numbered 413,857 and in 1914 150,416; of these, 352,251 and 131,938 were bound for the United States; 203,764 and 58,384 were Russians; 199,496 and 84,662 were Austro-Hungarians.

According to an English authority, criminality is much commoner in Germany than in England. It states that, with the German population being to the English about as 5 to 3, the crime of arson is about 4 to 1; murder, manslaughter, and other death-causing crimes, 5 to 1; unnatural offenses, 7 to 1; rape, etc., 9 to 1; incest, 13 to 1; procuring abortion, 29 to 1.

EDUCATION. Germany has a highly organized educational system which meets the practical requirements of every social class and which at the same time inculcates with unexampled thoroughness the idea that the national culture and polity are and must be paramount in human affairs. The educational system is virtually homogeneous throughout the empire, and its efficiency may be exemplified by the army recruiting statistics, which in 1913 disclosed only .04 per cent of illiterate recruits. The laws of Prussia, which provide for elementary schools, supported by local taxation, in every town and village and compel attendance at these or other schools, have been adopted, with slight modifications, in all the states of the empire. Instruc-

tion is compulsory from the age of six to fourteen.

The government maintains 11 technical high schools and 22 universities. In 1916-17, the technical high schools had an enrollment of 10,546 students, as compared with 10,824 in 1914-15. In the winter semester of 1916-17 the 22 universities had an enrollment of 60,041 students, as compared with 53,300 in 1915-16. There were enrolled 54,284 males and 5757 females; but the actual number in residence in 1916-17 was reduced, chiefly on account of the war, to 12,657 males and 5651 females.

AGRICULTURE. In 1913, arable land, including gardens, amounted to 26,059,200 hectares (about 48.2 per cent of the area of the country); meadow, 5,991,700 (11.1 per cent); pasture, 2,592,500 (4.8 per cent); vineyard, 118,600 (0.2 per cent); woodland, 14,223,200 (26.3 per cent). Areas under principal crops have been reported as follows for 1914 and 1915 respectively: wheat, 5,048,235 and 2,921,957; rye, 16,245,807 and 12,443,785; barley, 4,057,290 and 2,280,827; oats, 11,278,665 and 7,697,267; potatoes, 8,465,245 and 8,931,040; hay, 14,822,475 in 1914; sugar beets, 1,423,092 in 1914; vines, 254,880 and 242,642; hops, 68,317 and 59,342; tobacco, 35,405 and 22,537. Estimated area under sugar beets in 1916, about 1,000,000 acres; in 1917, 1,100,000 acres; estimated area under tobacco in 1916, 31,762 acres, and under hops, 44,472 acres. The table below shows for four years the estimated yield in metric tons:

	1912	1913	1914	1915
Wheat ..	4,360,624	4,655,956	3,971,995	3,885,841
Rye ..	11,598,289	12,322,394	10,426,718	9,152,402
Barley ..	3,481,974	3,073,254	3,137,983	2,483,752
Oats ..	8,520,183	9,713,905	9,038,185	5,986,034
Pot's ..	50,209,466	54,121,146	45,569,559	53,979,258
Hay ..	27,681,860	29,184,994	29,156,024	24,000,000
Hops ..	20,564	10,617	23,286	14,563
Tobacco ..	38,892	38,855	28,333	.....
Wine* ..	2,019,392	1,004,947	921,198	2,698,917

\* In hectolitres.

Reports of a good potato crop in the autumn of 1917 later seemed to have been too optimistic. The oat crop was reported in November so poor that farmers would be permitted to retain only enough fodder and grain of their own raising to give each horse two pounds daily.

Live stock as reported for December 1, 1915, in Prussia, Bavaria, Saxony, and the empire:

	Prussia	Bavaria	Saxony	Empire
Horses* ..	2,444,897	279,148	117,349	3,341,627
Cattle ....	11,776,765	3,701,860	722,642	20,316,948
Sheep ....	3,505,657	455,803	56,796	6,073,478

Swine .....	11,803,268	1,708,304	591,129	17,287,211

\* Exclusive of horses used in the army.

The number of cattle as reported for September 1, 1916, was 20,338,950; swine, 17,261,108.

The food shortage steadily continued but the policy of the food controller in the matter of rationing, etc., had the effect of making the meat supply last through the winter and even permitted the increase of the ration in March. At that time, however, the bread ration had to be reduced on account of the illegal course of the farmers who hoarded their stock and of the speculators who traded in bread cards. There were riots in Hamburg,

Magdeburg, and other centres, and the discontent of the laboring classes was reported to be spreading. General von Hindenburg issued a public appeal to the loyalty of the workmen in the munitions factories. The difficulty over the food question caused some friction between South Germany and Prussia. The food controller defended the seizure of foodstuffs as a matter of absolute necessity. Chancellor Michaelis declared in July that the shortage of food had never been worse but that he hoped for relief.

**COMMERCE.** The German customs territory includes the grand duchy of Luxemburg. On account of the war, Germany has not published commercial statistics for any year later than 1913. It is clear, however, that the British blockade has practically annihilated the overseas trade except with the Scandinavian countries. Published returns from other countries throughout the world show that the immense German foreign commerce has declined to a negligible amount and in many cases to nothing. On the other hand, German imports of foodstuffs and certain raw materials increased from the Scandinavian countries and from the Netherlands as the war progressed, while these countries imported increasing quantities of these articles. Before the end of 1917 the greater part of this trade seemed to have been stopped by the British and American embargoes.

Imports of merchandise for consumption in 1912 were valued at 10,691,800,000 marks, and in 1913 at 10,769,700,000 marks. Exports of German produce in 1912 were valued at 8,956,800,000 marks, and in 1913 at 10,097,200,000 marks. By great classes, imports of merchandise for consumption and exports of German produce were as follows in 1912 and 1913, in millions of marks (no later figures being available than these already given in the 1916 YEAR BOOK):

	Imports		Exports	
	1912	1913	1912	1913
Raw materials ..	4,823.2	5,003.0	1,382.4	1,518.1
Partly manufactured materials.	1,250.8	1,239.0	1,012.9	1,139.4
Manufactures ...	1,410.9	1,478.8	5,763.2	6,396.3
Food substances.	2,944.9	2,759.2	789.4	1,036.0
Live animals ...	256.0	289.7	8.9	7.4
Total .....	10,691.8	10,769.7	8,956.8	10,097.2

Classified imports and exports shown by percentages:

	Imports			Exports		
	1911	1912	1913	1911	1912	1913

Live animals ...	2.4	2.4	2.7	0.2	0.1	0.1

Details of trade are given in the 1915 YEAR BOOK.

There was much discussion in 1917 as to Germany's commercial condition and prospects after the war. In this connection, the following portion of a leading article in the *New York Journal of Commerce* of January 10, 1918, is pertinent:

"A good deal has been said of an 'economic league' against Germany, but such a scheme still remains a product of imagination and is unwise. The case is

quite different when a study is made of the general mental attitude of the peoples of the world toward German goods.

"Experience shows that national prestige and reputation are fundamental in successful foreign commerce. The disposition of different peoples to receive and trade with the representatives of foreign producers has much to do with the success of the latter. Great Britain's general equity of policy toward native races has opened wide fields for her world trade, while her free reception of the goods of competitors has had a like effect in civilized countries. The conduct of Germany during the present war, the inevitable and worldwide hatreds resulting from it, and the well founded suspicion of German standards of honesty and fair dealing that will survive for many years, must without doubt be serious obstacles in the way of German trade expansion. Too much stress need not be laid upon the fact that the mechanism of German foreign business has been destroyed—that her shipping is gone, her markets taken by others, her colonies transferred to others. It would not take long for a people as resourceful and energetic as the Germans to reestablish themselves abroad if the way were clear. The trouble which Germany must meet is that the way is not clear, and is not likely soon to be made so; and that what blocks it is the instinctive horror and dislike of all things German that has grown up in many minds the world over. No human being can predict how or when this feeling can be eradicated, even by a complete change in German standards of conduct and diplomacy, but it is not likely to be much reduced during the generation that has shared and suffered in the present war."

**SHIPPING.** In 1913, there were entered at German ports 115,966 vessels, of 34,772,177 tons (registered), and cleared 117,375 vessels, of 34,921,806 tons. German shipping entered amounted to 21,231,342 tons, and cleared 21,276,587 tons; British, 6,178,714 and 6,237,567; Swedish, 2,172,577 and 2,180,898; Danish, 1,703,232 and 1,714,237; Norwegian, 1,356,681 and 1,364,783; Dutch, 1,022,585 and 1,035,008; Finnish, 207,215 and 208,419; Russian, 197,031 and 191,513. In the German shipping records a vessel is counted as entered and cleared only once for each voyage, although it may touch at several ports.

The German merchant marine on January 1, 1914, consisted of 4935 vessels, of 5,238,937 tons gross and 3,320,071 tons net, as compared with 2,903,570 tons net in 1911 and 2,469,292 tons net in 1906. These figures exclude vessels of less than 17.65 tons gross (50 cubic metres). The personnel in 1914 was 83,898, as compared with 64,037 in 1906.

It has been reported and generally supposed that the building of merchant ships in Germany has progressed on a large scale during the war. This was contradicted in an "intercepted letter" alleged to have been written at Hamburg by Albert Ballin, a leading figure in the German shipping world, under date of December 4, 1917. The letter stated that Germany was building almost no new merchant ships; that the government subsidy system to extend the merchant marine would show no results for at least five years; that Great Britain would not only be able to cripple effectually German sea trade after the war, but would be in a position to cut off Germany's supply of raw materials. The letter as quoted contains the following passage in regard to the obstacle presented to German trade by the hostile sentiment in foreign countries:

"We look forward to resuming our sea trade. We build our proudest expectations on this. How are we to resume it in face of an Anglo-Saxondum which loathes and must loathe our presence among them? Do our fools of Chauvinists realize that we have hardly a port at which our ships can call and where a friendly welcome will be extended to them. Dover, Falmouth and Southampton, Gibraltar, Malta, and Alexandria, Aden, the Persian Gulf, Bombay and Colombo, Singapore and Hong Kong—what are

they? Great British arsenals, naval bases, coaling stations, repairing docks, in which we dare not show our faces if Britain so wills. It is the same around the African continent, the same in the West Indies and in the Pacific. We have not a coaling station of our own, not a place where we can effect repairs."

**COMMUNICATIONS.** The total length of railway reported as in operation March 31, 1915, was 64,195 kilometres (39,889 miles), of which 59,518 kilometres were state railway and 4677 kilometres private railway, and 61,977 kilometres normal gauge and 2218 kilometres narrow gauge.

The budget of the Prussian state railways for the financial year 1917-18 provided for extraordinary expenditures. In addition to the appropriation of 105,000,000 marks (\$25,200,000) for locomotives and rolling stock and 151,000,000 marks (\$36,240,000) for new works and renewals, etc., over 312,500,000 marks (\$75,000,000) were to be spent under the provisions of the "Railway Loan Law." Of this sum, 259,000,000 marks (\$61,160,000) were to be devoted to locomotives and rolling stock and 15,250,000 marks (\$3,680,000) to new lines; 10,500,000 marks (\$2,520,000) were to be spent on double track, 5,000,000 marks (\$1,200,000) on electric or narrow gauge railways and something under 23,000,000 marks (\$5,520,000) on miscellaneous works. The budget also estimated an increase of 225,000,000 marks (\$54,000,000) in freight receipts and a decrease of 52,000,000 marks (\$12,480,000) in passenger traffic. These figures were not to be taken at their face value in view of the extent to which the German railway receipts were nominally increased by payments for military traffic, which merely represented sums handed over or credited by one government department to another.

On August 1, an additional charge of 7 per cent on the cost of transporting of freight was imposed by the German railways, the charge to be paid by the shippers. Likewise surtaxes were introduced on passenger tickets, varying from 16 per cent on a first-class ticket to 10 per cent on a fourth-class ticket, with an extra charge for baggage of 12 per cent. These measures were taken both to increase the revenue and also to save the railway facilities as from July 1, 1917, it was made compulsory to send certain classes of freight by water, whenever possible. In certain cases, increased taxes were not levied on freight sent by water. A regular service of cargo steamers running between Altona and a number of other places including Berlin, and between Berlin and other cities was maintained, and it was forbidden to send certain classes of freight by rail from particular places on the Elbe, Oder, and other rivers. In a special article on German railway operations in occupied territory, the London *Daily Mail* stated that at the beginning of September 4000 locomotives and 155,000 cars were employed in Belgium, Serbia, Rumania, and Courland.

Notwithstanding the many discussions provoked by the European War regarding the ulterior aims for a Pan-Germanic empire, that would occupy a large portion of the continent of Europe, and extend even into Asia Minor, it is difficult for most Americans to realize the extent of the thought that has been expended on the development of plans in this direction. Americans are apt to delude themselves that the North American continent is the only one

where schemes of transcontinental railways, such as those of Canada and the United States, have figured. On second thought, they may recall the trans-Siberian railway or the Cape-to-Cairo in Africa, or even the line crossing the Andes in South America. Therefore, it may come somewhat as a matter of surprise, that, in connection with the German plans for the extension of their empire and influence to the Persian Gulf, there has been developed a scheme of transcontinental railways which involved, not only the connection of existing lines in Europe and Asia Minor into virtually one operating system, but also the construction of some 9800 kilometres (6090 miles) of new line. In this development, which is described from German sources in a recent issue of *Engineering* (London), and which was prepared with great detail and with the customary thoroughness, every phase of the matter—political, economic, and engineering—was considered. Indeed it was one of those schemes of empire which takes a long look into the future, and with the assurance of the support of the Imperial government, the various coöperative interests concerned were being prepared for a project which might involve the averaging of dividends over a number of years with scant, if any, return at first. The scheme was developed with the belief that Germany would be successful in the war, and thus would be able to enforce not only the co-operation of her allies, but the subjugated states traversed by the proposed system, and the tributary countries. These states, of course, would be compelled to raise a certain amount of money to carry on the scheme, whether they desired to do so or not, but obviously, aside from political considerations and obedience to German demands, the commercial developments that naturally would follow such railway construction and developments would, of course, provide an additional consideration. This scheme, it might be said in passing, was developed prior to the occupation of Bagdad by the British, and the success of their campaign in Mesopotamia. Accordingly, such developments may have brought changes in the scheme as originally matured, but until Germany is forced to forego all idea of world dominion, it will most likely remain a leading consideration.

One of the early and very obvious lessons of the war was the importance of interior communication by complete railway systems, and the Germans very properly reasoned that, if this had worked so successfully with a single country, enabling them to transfer forces from the western to the eastern frontier, or vice versa, it would be an even greater advantage when military considerations demanded the transfer of military forces from one continent to another. Furthermore, it was apparent that Germany, supplied with such effective interior railway lines, would have a great advantage over Great Britain and France, where the only means of communication would be exterior and involved, in large part, water communication.

A glance at the map of Europe and Asia will show that between Germany and Persia, there are four kingdoms, which are either in alliance with, or under the subjugation of, the predominant influence in Berlin. Austria-Hungary, Serbia, Bulgaria, and Turkey, with near by Rumania, are the countries through which this great German transcontinental line would pass;

and the strategic importance in time of war would be so apparent, that they would either willingly coöperate in its construction and maintenance, or might be compelled to do so by force. Such a line would effectively divide the forces of western Europe, and at the same time, would enable the Central European Powers to be abundantly provided with food and raw materials. On the other hand, in times of peace it would afford an important market for German manufactures and other products, and at the same time bring to that empire raw materials. Germany has, in Asia Minor, a great potential market whose resources never have been adequately exploited on account of the governmental conditions, and the government and individual policies of the Turks, but Turkey, under German guidance, would be entirely different from its condition under the somewhat easy government of the sultan, and, while territory might not actually be appropriated, yet it is very probable that, where German markets could not be established readily, some form of compulsion would be exercised.

The scheme of a Pan-Germanic railway has been prepared in the largest possible way, for it is realized that only when developed as a whole, will an adequate reward ensue. Neither local traffic alone, or transcontinental business exclusively, would warrant such a scheme, but both together and, with a system operated with a view to the greatest economy in maintenance, and working under a single central management. The greater part of the construction would be outside of Germany and Austria, as these two countries are well supplied with railways, useful both on the side of strategy and for commerce.

The programme for the construction of the new system was divided into four stages, with a certain amount of new construction or extension scheduled to take place each stage. In the aggregate new lines to be built or existing lines to be extended are shown in the accompanying table:

	1st Stage	2nd Stage	3rd Stage	4th Stage	Total
	km.	km.	km.	km.	km.
Hungary . . . .	1,413	673	64	350	2,500
Bulgaria . . . .	1,057	240	153	350	1,800
Rumania . . . .	696	371	...	23	1,000
Turkey . . . . .	1,775	1,750	600	375	4,500
Total . . . . .	...	...	...	...	9,800

The first stage was to be completed in the course of three years, involving certain extensions of the present main line to the east from Berlin to Aleppo. This would require a double track from Oderberg, in Silicia, where Germany, Russia, and Austria join; via Temesvar, Hungary; Bazias, on the Danube, forty miles east of Belgrade; Pirot; Sofia the capital of Bulgaria; Constantinople; Eski-shehir, 100 miles southeast of Constantinople; Angora; Marasch; and on to Aleppo. This stage also involved strengthening the permanent way from Bukarest; northward via Kronstadt in Hungary; to Szvonok west of Budapest, in the valley of the Theiss; over Orsova near the Iron Gates on the Danube, and Czegled, south of Budapest; and over Rustschuk to Tirnova-Slajemen.

In Asia Minor the main feature would be connecting lines from Lefke, ninety miles south-

west of Constantinople; via Brussa, to Bali-kesri; from Akshehr to Egerdir; and from Boli to Eregli, in connection with the coal fields of Heraklea.

The Danube would be crossed at Bazias by means of a railway bridge, and ferries would be provided at Rustschuk in Rumania, and also at the Bosphorus.

The second building stage, which was calculated for six years, involved a double track on the Bukarest-Orsova-Temesvar and Pirot-Temesvar-Kisterema sections, while in Asiatic Turkey, a new line would run from Boli to Erzerum, 120 miles south of Batoum on the Black Sea, with branches to Ineboli, Amasia, Sivas, Trebizond, and Charput.

The third stage, which would be completed within nine years, would comprise a new line from Erzerum via Bitlis to Mosul where it would connect with the Bagdad railway, while the fourth stage would involve a double track on the section Pirot-Belgrade-Budapest, and some additional auxiliary sections in Asiatic Turkey.

Referring this outline to the map, it is at once apparent that a strategic railway system of high efficiency is thus planned, and that Turkey in addition is provided with lines extending to all the frontiers of Asia Minor, as well as traversing its central districts. Furthermore, these and branch lines would develop regions rich in minerals, which would supply an invaluable trade with central Europe, either in times of peace or of war. There are two aspects to the matter, namely, the question of local transportation and traffic, to be dealt with by the separate countries, and a central or comprehensive organization that would operate the entire system on a scheme quite new to European railway operation. There would be heavy freight trains with large cars built somewhat according to the latest American practice, and sleeping-cars operated in trains-de-luxe, that would make the 3100 mile trip from Berlin to Bagdad in between eight to ten days, with every possible comfort and such reasonable tariffs, as would lead to the development of through traffic.

With a good and adequate outlet for its produce along this railway, Turkey would increase its trade with the Central European Powers, at the expense of the commerce of the Entente Allies and with greater economy, due to the substitution of rail for oversea transportation.

The estimated outlay for construction is contained in the following table:

First Stage:		Marks
For Central Europe—		
690 km. new lines in Bulgaria . . . .		122,000,000
60 km. improved lines in Bulgaria . .		4,000,000
324 km. improved lines in Hungary . .		20,000,000
For Rumania—		
257 km. improved lines in Bulgaria . .		15,000,000
50 km. new lines in Bulgaria . . . . .		9,000,000
1089 km. improved lines in Hungary . . . . .		76,000,000
240 km. new lines in Rumania . . . .		53,000,000
386 km. improved lines in Rumania . .		22,000,000
For Asiatic Turkey—		
1475 km. new lines in Asia Minor . . .		232,000,000
360 km. new lines in Europe . . . . .		40,000,000
For Train Ferries—		
Across the Danube at Rustschuk . . . .		4,000,000
Across the Bosphorus . . . . .		5,000,000
		602,000,000

<b>Second Stage:</b>		<b>Marks</b>
For Central Europe and Rumania—		
240 km. second set of lines in Bulgaria .....	43,000,000	
673 km. second set of lines in Hungary .....	121,000,000	
371 km. second set of lines in Rumania .....	67,000,000	
For Asiatic Turkey—		
1750 km. new lines in Asia Minor .....	350,000,000	
	581,000,000	
<b>Third Stage:</b>		
64 km. new lines in Hungary .....	12,000,000	
153 km. new lines in Bulgaria .....	28,000,000	
600 km. new lines in Asia Minor .....	120,000,000	
	160,000,000	
<b>Fourth Stage:</b>		
350 km. second set of lines in Bulgaria .....	63,000,000	
350 km. second set of lines in Hungary .....	63,000,000	
28 km. new lines in Rumania .....	4,000,000	
375 km. new lines in Asia Minor .....	68,000,000	
	198,000,000	

There seems to be no question in the minds of the promoters of this enterprise that the territory traversed will supply adequate freight business for the system, and that the annual turnover will be vastly exceeded, once the regular channels of commerce are established; but, as stated above, this will be possible only if the system is operated under modern conditions of high capacity loading and high efficiency. Thus freight cars with a capacity of from thirty-three to fifty tons must be used, and locomotives with a hauling capacity of 1000 ton gross load, an average haul of 2000 km. for all goods, and a train of 600 tons; an annual locomotive mileage of 30,000 km. and for the freight cars 15,000 km.

The outlay for rolling-stock required for the completion of the first stage would be:—

	<b>Marks</b>
20,700 goods wagons, at 9000 marks each .....	186,300,000
430 engines at 100,000 marks each ..	43,000,000
	229,300,000
<b>After the completion of the Second Stage:</b>	
9300 goods wagons, at 9000 marks each .....	83,700,000
200 engines at 100,000 marks each ..	20,000,000
	103,700,000
<b>After the completion of the Third Stage:</b>	
22,500 goods wagons, at 9000 marks each .....	202,500,000
490 engines, at 100,000 marks each ..	49,000,000
	251,500,000
<b>After the completion of the Fourth Stage:</b>	
3500 goods wagons, at 9000 marks each .....	31,500,000
80 engines, at 100,000 marks each ..	8,000,000
	39,500,000

Not only were the questions of construction for the line worked out, but even the tariffs, which were adjusted to suit that of the German Levant Line before the war. These varied from 30 marks to 32.50 marks per ton from Germany to a port in the Balkans or Asia Minor, with correspondingly decreased rates for lesser hauls in Europe, and special tariffs for car-load rates for various journeys.

With limited financial resources in many of

these states, which have been overrun with war, it would be manifestly impossible to supply all the capital required for such an enormous undertaking; and it was proposed that, while the respective states should construct the line, a Central European goods traffic company should be formed to provide the rolling-stock and operate the system. It might be possible to form a special Turkish freight company for the extension of the Turkish railway system, and to systematically develop the traffic throughout Europe and Asiatic Turkey. The proposed scheme involved Central European and Turkish traffic companies, with a capital stock of 343,000,000 marks which would pay a 5 per cent dividend, while the state lines would provide for the loan of 1,183,000,000 marks in the form of bonds which would pay 4 per cent interest with a sinking fund of 1 per cent per annum. These figures were expected to apply to eight years of the scheme after the completion of the first and second building stages.

Such is an outline of the very complete and systematic plan looking toward world empire, and unquestionably one that would have to be reckoned with in event of the triumph of the German armies, with all the many consequences, military, political, and economic, that would follow. While America may not be directly concerned with commercial transformation in eastern Europe and Asia Minor, yet through its alliance it is in a position to appreciate the effects of any transfer of political and commercial power.

Telegraphs in 1913: lines, 238,493 kilometres (143,192 miles); wire, 765,327 kilometres; offices, 50,013. Places having telephonic communications, 41,087. Post offices, 41,415.

**FINANCE.** The legal standard of value is gold. The monetary unit is the mark. The par value of the mark is 23.821 cents. On account of the enormous loans contracted by the government and issues of paper money, the mark has greatly depreciated during the course of the war. For the fiscal year ending March 31, 1918, the estimated ordinary revenue and expenditure of the empire balanced at 4,941,876,060 marks; extraordinary revenue and expenditure 85,929,228 and 93,204,992 marks respectively; total, 5,027,805,288 and 5,035,081,052. These estimates are exclusive of war credits and of expenditure on army and navy; but the estimated expenditure includes imperial debt charges, placed at 3,566,793,842 marks.

The total funded debt on October 1, 1916, amounted to 50,772,730,000 marks; treasury bills amounted to 13,779,660,000 marks, of which 10,339,200,000 marks were non-interest-bearing.

According to a booklet compiled by the Mechanics and Metals National Bank of New York, Germany's direct war expenses from August 1, 1914, to December 31, 1917, were \$23,750,000,000. Similar expenses of Austria-Hungary, Turkey, and Bulgaria were \$16,400,000,000, making for the Central Powers a total of \$40,150,000,000. The total for the Entente Allies was \$81,660,000,000, apportioned as follows: Great Britain, \$26,250,000,000; France, \$19,600,000,000; Russia, \$17,700,000,000; United States, \$6,700,000,000; Italy, \$5,850,000,000; Belgium, Serbia, Rumania, and Portugal, \$5,500,000,000. At the end of 1917, the average daily net war cost to Germany was about \$27,200,000, and the average

daily gross war cost about \$30,000,000. The daily net expenses of all the Allies at the end of 1917 were placed at \$115,600,000, as compared with \$43,200,000 for the Central Powers. The disparity is explained by the different conditions under which the opposing groups were fighting, by the need of the Allies to spend large sums in keeping their navies and mercantile fleets at sea, by the different systems of pay in the armies, and by cost of manufacture and transportation.

At the end of 1917, the daily per capita war cost in Germany was about 44 cents, as compared with a daily normal per capita income of 44 cents. Similar figures for the other great nations engaged in the war: Austria-Hungary, 21 and 26; Great Britain, 74 and 70; France, 50 and 51; Russia, 10 and 11; Italy, 22 and 32; United States, 28 and \$1.05.

Sir Edward Holden, managing director of the London City and Midland Bank, stated that in July, 1914, Germany's ratio of gold to notes was 72 per cent and the ratio of cash to liabilities 63 per cent, while in December, 1917, the ratios had been reduced to 21 and 20 per cent respectively. The total issues of German paper money, he said, amounted to £144,000,000 in December, 1913, £335,000,000 in December, 1914, and £984,000,000 in December, 1917. He stated that war loans amounted to £3,647,000,000 and the floating debt to £1,450,000,000, the total being £5,100,000,000, against £4,900,000,000 for Great Britain. See FINANCIAL REVIEW.

**ARMY AND NAVY.** The statistics for the army and navy were of course lacking. See the article WAR OF THE NATIONS.

**GOVERNMENT.** The German Empire is a federation of states under a constitution bearing date of May 4, 1871, and amended March 10, 1888. The dominating and largest state is Prussia (q.v.). The imperial constitution vests the executive authority in the King of Prussia as German emperor; he is authorized to conclude treaties, to declare war (if defensive) and peace, and to appoint and receive diplomatic representatives. In 1917, the German Emperor was William II, who was born January 27, 1859, and succeeded his father (Emperor Frederick III) June 15, 1888. The crown prince of Prussia and imperial heir-apparent is Prince Frederick William, born May 6, 1882.

The imperial legislature consists of the Bundesrat (federal council) and the Reichstag. Members of the Bundesrat (61 in number) represent the constituent states and are appointed for each session by their respective governments. Members of the Reichstag (397 in number) represent the German nation and are elected for five years by direct manhood suffrage. Prussia is represented by 17 members in the Bundesrat and 236 members in the Reichstag.

The imperial ministers, or secretaries of state, do not form a ministry proper (that is, one responsible to the popular branch of the legislature), but act independently of each other under the general supervision of the imperial chancellor. The chancellor, who is also president of the Bundesrat, is the highest official of the empire; he is appointed by the emperor without regard to party strength in the Reichstag, and to the emperor he is directly responsible. On July 14, 1917, Theobald von Bethmann-Hollweg, who had served as imperial chancellor from July 14, 1909, was succeeded by Georg Mi-

chaelis. Michaelis was succeeded on November 1, 1917, by Georg Count von Hertling, the Bavarian prime minister. Alfred Zimmermann, who succeeded Gottlieb von Jagow as secretary of state for foreign affairs in December, 1916, resigned July 14, 1917, and was succeeded by Richard von Kuehlmann. Karl Helfferich, who succeeded Klemens Delbrück in 1916 as secretary of state for home affairs and representative of the chancellor, resigned November 1, 1917, and was succeeded by Friedrich von Payer. The secretary of marine, Admiral Eduard von Capelle, who succeeded Grand Admiral Alfred von Tirpitz March 16, 1916, resigned in October, 1917, but the resignation was not accepted. Other secretaries of state: Treasury, Siegfried Count von Roedern, who succeeded Karl Helfferich in 1916; colonies, Wilhelm Solf, from December 20, 1911; justice, von Krause; posts and telegraphs, Rüdlin. The Prussian war ministry is in effect the war ministry for the empire; Prussian minister of war, Lieut. Gen. von Stein, appointed October 23, 1916.

#### HISTORY

**MOVEMENT FOR CONSTITUTIONAL REFORM.** In the spring the chancellor's position was very difficult. On the one hand were the extreme Conservatives and National Liberals, who demanded extensive annexations, and on the other hand the Socialists and moderates, who wanted peace by compromise and without conquests. The events in Russia which had come to the knowledge of the German government before the people knew of them, led the chancellor to promise immediately the electoral reforms for Prussia (March 14). The announcement caused great surprise until news of the Russian revolution reached the country. In the course of his speech on that occasion the chancellor said that one would have to be blind to the signs of the times if he thought that after this war the internal political life could go on as before. It was senseless, he said, to believe that you could put the new wine into the old bottles. After the announcement of the reforms, a Socialist deputy declared that a republic in Germany was inevitable. There followed a strong movement in parliament for constitutional reform, especially as to the membership of the Reichstag and its relation to the government. A National Liberal resolution providing for a committee of twenty-eight to consider such reforms passed the Reichstag by 227 to 33 on March 30; also a subsequent resolution offered by the Socialists, which referred to this committee all constitutional questions. A sharp debate took place on March 31, resulting in the proroguing of parliament to April 24. In the course of it the Socialists demanded that the Reichstag should have larger powers in foreign affairs. In the meanwhile the emperor intervened, saying in a manifesto published April 7, that a far-reaching change of the constitution would be introduced, but must be postponed until after the war. The committee on constitutional changes continued its work after parliament met, but no definite result had taken place when it adjourned again on May 17 for seven weeks. The changes that were considered pertained to the enlargement of parliament's powers and to reform of the representation. Though nothing of a progressive nature was accomplished by the Reichstag, two liberal measures were adopted by the Bundesrat,

viz., the repeal of the Jesuit act, which for many years had prevented the Jesuits from having any legal status in Germany, and the repeal of the law forbidding the use of any other language than German at public meetings, which had been passed to prevent agitation among the Poles.

**GERMANY AND THE RUSSIAN REVOLUTION.** The German attitude toward the Russian revolution was set forth in a speech by the German Chancellor, Herr von Bethmann Hollweg, reported on March 29. He said that the policy of the Czar Nicholas had grown more and more hostile to Germany, inclining toward the Allies before the war and toward the Pan-Slavists. Finally it had surrendered completely to the war party and in July, 1914, the czar had refused to listen to the appeal of the German Emperor. As to the report that the German government had always aided the autocratic suppression of liberty in Russia it was entirely contrary to the facts. In 1905 it was the German Emperor that advised the czar no longer to oppose the legitimate wishes of the nation for reforms. If Russia had fixed her attention upon internal reforms there would have been no room for the restless policy of expansion which had brought on the war. As to Germany's policy toward Russia it would follow the same principle as before; that is to say, non-interference with the internal problems of other countries. He said that the malicious report that Germany wished to destroy the newly won freedom of the Russian people was utterly false. The one thing that was to be hoped was that Russian conditions would take such a form as would make her in future a stronghold of peace. Germany had suffered enough from the crimes of old Russia which had instigated the military attack of Serbia on Austria-Hungary, which had mobilized against Germany in 1914, and which was the first to reject Germany's peace offer in December, 1916. The Russian people need have no anxiety that Germany would interfere with them.

**THE STOCKHOLM CONFERENCE.** The manifesto of the Social Democracy which was issued at the Stockholm Conference naturally brought out wide differences of opinion in Germany. The Pan-Germans in accordance with their policy attacked it sharply. The National Liberals held a meeting soon after the manifesto appeared and unanimously voted a resolution which reaffirmed the purposes of the war as they had been defined by them in May, 1915, when they declared that Germany must annex on the west such territory as was necessary to guarantee and strengthen her power both on land and sea; and that on the east she must not only acquire better strategic frontiers but new territory to colonize. In short there must be a chance for German development over-seas in accordance with the interest of her people in the world's commerce. The business interests were strongly represented in the Pan-German party, which comprised many of the most prominent capitalists in the country. There were, however, important groups of persons who were opposed to the Pan-German policy. Some of them were disappointed in the results of the submarine warfare, others were affected by the monetary crisis which lowered the rate of exchange against Germany.

The German and Austrian peace terms in the Stockholm Conference were regarded by the

Allies as the work of the German Chancellor. They were not such peace terms as could be avowed in the German parliament. The Chancellor, about the middle of May, had refused to commit the government to the principles of no annexations and no indemnities, to which of course the Pan-Germans of the Prussian official class were bitterly opposed. It was argued that the German government was not sincere in promoting a peace movement on this basis, but that it did so in order to win over the Russian Socialists who were aiming at peace as soon as possible in order to benefit from the revolution in their own country. Hence it seemed to be the policy of the Germans to conciliate Russian opinion in order to induce the Russians to concern themselves with their internal affairs and stop fighting. It was said that the Germans hoped that in that case civil war in Russia might result. It was argued by the Allies that these were the real motives behind the German attitude toward the conference of Stockholm and it was pointed out that the German Socialist proposals really did not involve the surrender of Germany's military and economic advantage. They demanded an independent Finland and an independent Poland, but these were to be taken out of Russia's territory. Austria was to retain Galicia, and nothing was said about joining Posen or the Poles of West Prussia to the new Polish kingdom. Turkey was to get back Armenia and Mesopotamia; Austria to retain Bukovina and Transylvania; and Germany was to regain her lost colonies. Thus Germany would retain even on this basis as much as she could reasonably hope to get out of the war, namely, the eastern frontier against Russia made secure by the buffer state of Poland; complete political and economic control over Austria-Hungary, Bulgaria, Greece, and Turkey; in short, the establishment of that middle European empire of which she had dreamed. It was pointed out that peace on such terms would really mean a greater advance for Germany than after the victories of 1866 and 1871. Finally, if Germany were not beaten the government would not consent even to these terms. Whereas, if Germany were beaten, such terms as these would, from the point of view of the Allies, be wholly inadequate.

**THE CRISIS OF JULY.** Debates in the Reichstag in the first week in July revealed a strong opposition to the government. The well-known orator of the Centre, Matthias Erzburger, made a speech which, though not published, as the meetings of the committee in which it was delivered were secret, was known from the reports which leaked out to have been a very serious criticism of the whole conduct of the war. The ruling classes that had directed German policies in the war had confidently predicted that the submarine warfare would reduce England to powerlessness by the beginning of August. Among those who had insisted on this were such leaders as von Tirpitz and Reventlow, and along with them were all the generals, the jingo element, and the whole Pan-German group. In his speech Erzburger declared their figures wrong, and their predictions false, and that instead of bringing England to her knees, they had brought the American continent into the war. The speech created something like a panic inside parliament and without and had the effect of uniting the three great parties of

the Socialists, Catholics, and the Radicals, against the government. On July 10 the chancellor announced in committee that he would not reveal the conditions of peace, but that the formula of peace without annexations was not acceptable. He soon found himself unable to control the situation. His attempts to compromise the two parties into which the whole nation was divided, the military party and the moderates, failed completely. His former adherents fell away from all sides. Then followed a period of conferences and rumors indicating a serious political crisis. The Centre decided to support Erzburger's attitude. The purpose of this policy, according to its advocates, was to show to the Allies by getting a definite declaration on the subject of German aims in the war that the Prussian military caste was not the controlling factor and that the Allies were really making war upon the entire German people. Many Germans believed that the introduction of a more democratic government would place them in a better situation before the world and defeat the arguments of the Allies that the war on their part was for democracy against despotism. Despite the emperor's promise of reforms in Prussia nothing definite had been done. The chancellor was attacked both by the parties who wanted reform and those who did not; by the Pan-Germans on the one hand and by those who favored a peace without annexations on the other; and finally by those who believed that the submarine warfare was a failure and that it had injured Germany's chances by bringing the United States into the war. On July 12 it was announced that two members of the cabinet had given up their portfolios and that a Socialist would be admitted to the ministry in charge of a new department of labor. In the press of the Allies there was a tendency to explain these developments as signs of an approaching revolution. On the other hand it was pointed out that even if the points demanded by the Clericals and extreme Socialists, namely peace without annexations, no indemnities, and a programme of internal reforms, were conceded by the government it would not mean that Germany would meet the demands of the Allies, for peace without annexations was generally interpreted as a return to the status quo before the war and the internal reforms were not likely to go so far as to displace the ruling classes. As to peace without annexations, a prominent Socialist explained it as practically meaning German control of middle Europe from the North Sea to the Persian Gulf and the restoration to her of all her African colonies. He argued that this arrangement would leave her much stronger than before and would break England's exclusive power on the seas. An interesting interpretation of the movement for internal reforms was given out by Professor Hans Delbrueck on July 10. He said that in the main the Conservative party was opposed to the measure and that he believed they would prevent their adoption till after the close of the war. He himself and others of the Conservatives whom he characterized as "enlightened" united with the middle parties in a demand for immediate reform. Success, however, seemed doubtful. England, Belgium, and Italy, he said, have not a general and direct suffrage even now, so if Prussia took the step of universal suffrage, it would be in advance of those countries. Opposed to this reform were

the strongest elements in the country and these reactionaries were strengthened by the policy of the United States and Great Britain in declaring that peace could come only when Germany was democratized. The progressive classes in Germany were naturally angered by this interference of foreign governments with their internal affairs and many of them turned against their own programme rather than carry it out under dictation. It was the opinion of Professor Delbrueck that the surest way of securing the reform would be to divorce it altogether from Germany's foreign policy. He believed that the situation in Germany had been simplified by the Russian revolution. Down to that time Germany had believed herself menaced by the Russian army, which was almost twice the size of the armies of Germany and Austria-Hungary combined. By the defeat of Russia and the bringing on of a revolution which gave liberty to Russia, Germany had in a sense freed herself. There was less danger from a democratic Russia than from Czarism and Germany could now reduce her armament.

On July 11, the emperor as King of Prussia signed a rescript promising the reform of the Prussian three-class system for the next election, which would therefore be on the basis of equal suffrage. On this occasion the journal of Maximilian Harden, celebrated for its outspoken criticism of the government, was suppressed. The opposition to the chancellor, however, had gathered such strength that he was forced to resign (July 14). He was succeeded by Dr. Georg Michaelis, the Prussian food controller, who had previously been under-secretary of finance. It was said that the new chancellor's programme would be unity on internal questions; confidence and solidarity in foreign policy; and the maintenance of the tried policy of the alliances. The Kaiser published a farewell message to the retiring chancellor in which he praised him for his services and expressed his regret for his resignation. According to the comments in the press, which were very severe, the return of von Bethmann to power was out of the question. The new chancellor was described as a man of strong character of the strictly bureaucratic type. As commissary for food supplies in Prussia he had introduced strict measures and had employed soldiers throughout the country as inspectors to pass from house to house in order to discover hidden stores of food. This measure had resulted in only a small increase in the supply and made him many enemies.

THE RESOLUTION OF JULY 19. On July 19 the Centre, Progressives (or Radicals), and Socialists carried by a majority of about 100 a resolution that marked an important stage in the political situation and was much discussed throughout the year. This rejected the policy of "forced annexations" and any policy of political, economic, or financial oppression after the war, and set forth as the object of the conflict the liberty, independence, and integrity of the German Empire. The Conservatives and National Liberals voted against it. Thus the majority in parliament committed itself against the plans of the Pan-Germans. It was taken among the Entente Allies as a sign that the Germans were beginning to take a more moderate view of the situation and to inquire into the reason of the hatred of them which was so manifest in neutral

as well as hostile countries. It started a flood of criticism of the government in influential quarters in Germany, where it was asked why America had been brought into the war and why German diplomatic policy should lead to such affairs as those of the Zimmermann note in Mexico and the Luxburg revelations in Argentina (see *THE UNITED STATES AND THE WAR*). The vote was further significant as indicating a tendency on the part of parliament to assume control and as a step towards the establishment of ministerial responsibility. Then came, as noted above, the appointment of Dr. Michaelis, who was comparatively unknown and who had not taken part in either parliamentary affairs or foreign politics. He was thought to have been chosen by the emperor because there was nothing known against him. The first problem of the new chancellor was how to come to an arrangement with parliament over the July resolution. In this matter he compromised and shifted and though professing to accept it, he introduced so many conditions and explanations that it was clear that he meant to keep it or leave it as he saw fit. The main points in his speech were as follows: That Germany would not continue fighting a day longer merely for conquests, "if she could obtain an honorable peace"; that the German peace would be the peace of a country that had successfully carried out its purpose; that German territory was inviolable and that the peace must be one that would secure the frontiers of the empire, that peace must be made on a "give and take" basis; further, that Germany must have guarantees for the existence of both its continental and its colonial empire; that there must not be any economic offensive alliances against Germany after the war; and that finally it was the turn of the Allies to offer peace now, Germany having done her part already. He said also that he was ready to accept the Reichstag's peace resolution of July 19, "as he understood it." In the direction of foreign affairs Dr. Michaelis soon seemed to be overshadowed by the new secretary of state, Herr von Kühlmann, who was prominent in Germany and well known abroad as a skillful diplomat. The policy followed by Kühlmann had for its object to sow distrust among the Entente Allies. After the vote on the peace question parliament passed the war credit of 15,000,000,000 marks and adjourned to October.

**THE CRISIS OF OCTOBER.** When parliament met again in October a new crisis arose on account of the campaign carried on not only in the country but in the army and navy for what was called a German peace. The Socialists endeavored to show that this campaign, while pretending to stimulate the patriotism of the troops, really was turned into an attack upon parliament. They accused these propagandists of fostering in the army with the approval of the higher military authorities a contemptuous attitude towards the civil government. The ministry was interpellated on this point, and the answer was given by the minister of war, von Stein, who, however, won no confidence by his reply, in which he simply refused to take the affair seriously. The vice-chancellor, Helfferich, was equally unsuccessful. The parliament then took the serious course of referring the new vote of 300,000,000 marks for war supplies back to the committee as an expression of its resentment

that the Chancellor himself had not been present at this discussion. A few days later the Chancellor did address the committee and Helfferich made an apology, but the government soon fell into a still more serious error. The Socialist deputy, Herr Dittman, having accused the government of unfairly treating the sailors, and referred to a disorder which had taken place in the navy, was answered by Admiral von Capelle, secretary for the Marine to this effect: The Russian revolution had turned the heads of a few people in the fleet and a plan was formed by them to choose leaders who would stir up a spirit of disobedience among the men. He then added that documents had proven that the chief agitators had made the plans known in the parliament building in the rooms of the Independent Socialist party to deputies Dittman, Haase, Vogtherr, who had approved these plans. This provoked sharp criticism from all parties except the extreme Right, as an attempt to discredit these members, who had not been present at the court-martial whose evidence was cited by the admiral and had not been brought to trial as they should have been if the charges were genuine. The Reichstag passed the war estimates and was at once prorogued, but the position of the chancellor was hopelessly compromised. During the last week in October, Dr. Michaelis resigned and Count von Hertling, former president of the council of Bavaria, was appointed. Before assuming office he resorted to the unprecedented measure of conferring with the party leaders. For several days these interviews continued and though at one time he seemed to have failed he finally came to a satisfactory arrangement and accepted the chancellorship. This was taken as a sign of the approach to a parliamentary form of government. Von Hertling was seventy-four years old, an ultramontane Catholic, and a former supporter of von Bethmann-Hollweg. His record seemed to mark him out as a decided conservative and his attitude toward the war, to judge from certain public declarations, was not conciliating. When the note from the Pope was under discussion and the question of Belgium in particular came up he had said that the moment had not yet come to make known the intentions of Germany in regard to Belgium; but that in any case Germany would see to it that she received the necessary political and economic guarantees that should put her beyond danger of the hostility of Belgium in the future. As to Alsace-Lorraine, he favored the proposal which had been discussed in the spring for the division of the provinces between the states of the empire. Alsace to go to Bavaria and Lorraine to Prussia. He had declared that nothing should be done in Germany to change the federal character of the empire and that all efforts to centralize and unify Germany were doomed to failure. On the other hand there were incidents in the career of Von Hertling which pointed in the opposite direction and which made him distasteful to the Pan-Germans. For example, he had acted as mediator between Count Czernin and the German government on the question of peace. The comment in the newspapers was divided on the subject. Some reproached him with his Clerical and Conservative origin; others (especially Socialists) with his desire to divide Alsace-Lorraine. Von Hertling's programme included the acceptance of the Reich-

stag's demand for the immediate carrying out of the Prussian electoral reforms, for the abolition or relaxation of the political censorship and the state of siege, and for a foreign policy along the lines of the Pope's message.

**PRUSSIAN ELECTORAL REFORM.** In February a bill passed the Landtag giving the municipal vote to the soldiers at the front. As noted above the emperor on April 7 had made a vague promise of reform, but on July 11 had instructed the ministry to bring in a bill before the next elections revising the Prussian system on the basis of equal franchise. The government's measures were made public in December. For the lower house of the Prussian parliament the bill provided for the introduction of the equal, direct, and secret ballot, which was to be possessed by every Prussian who had been a subject for at least three years and was twenty-five years of age or more and had been one year in the district. The vote could only be cast within the district. Soldiers on duty could not vote. There was to be one deputy for every 250,000 inhabitants, with the exception of a dozen districts each of which had an additional deputy. These were in the industrial regions of the Rhine and Westphalia. Another important feature was the right of the upper house as regards the budget. Down to that time the upper house could simply accept or reject the budget as a whole without amendment, but the new measure gave it the right to discuss and amend every clause. Again the composition of the upper house was radically changed in the following manner:—10 representatives of the mediatised princely houses; 24 representatives of the princes and counts; 26 of the other hereditary nobility; 36 burgomasters; 36 representatives of the great landed property owners; 36 representatives of commerce and industry; 76 representatives of the communes; 84 representatives of the professional corporations, of which 36 were for agriculture and 36 for commerce and industry and 12 from among the artisans; 16 representatives of universities and 16 church representatives. The King of Prussia was to nominate 150 peers. The total number of the members of the upper house would then be 510. This by no means satisfied the democratic demand. The Socialists said that the more the thing was changed the more it remained the same and declared that Prussia would henceforth be governed more than ever before in an absolute manner, for in case of any conflict between the will of the people and the government, the government could, according to the constitution, take the course that it desired. To be sure it had granted equal, direct, and secret suffrage; but to offset that it had refused to admit the laboring class into the upper house. The new electoral system was not universal and the slight progress that was made was far more than offset by cutting down the rights of the lower house in the matter of the budget. In many quarters the failure of the measure was predicted, for on the one hand it did not go far enough to meet the views of the Democratic element and on the other hand it went too far for the Conservatives. The bill was under discussion in the Prussian lower house in December. It appeared that the great majority of the National Liberals were resolutely opposed to it. Their spokesman declared that they would never accept universal suffrage. Although the King of Prussia had promised it

several times, especially in his Easter message and in that of July 11, they would not abandon their rights as lawmakers for respect for the king, who had been misled by von Bethmann-Hollweg in this matter, the latter aiming solely to save his office. The house must save the king from the consequences of this error of the chancellor. The masses did not understand politics. Ignorant voters would be at the mercy of demagogues. Other states would have to follow Prussia. This would be disastrous especially in Saxony, where in the last Reichstag elections over 50 per cent had voted for Socialists. It would give a Socialist majority in the Saxon Diet and the government could not get on with it. A member of the government defended it, saying it would stir up the wrath of the people if rejected. The spokesman of the Free Conservatives declared his group squarely against it. A representative of the Poles favored it. House postponed discussion.

**GERMAN WAR AIMS.** It was impossible even to summarize the vast amount of speculation, suggestion, and argument on the subject of the aims of Germany. The Germans themselves were divided and the gap between the Pan-Germans on the one hand and the extreme Socialists on the other was very wide. In spite of the check to the German advance during the year the ambitions of the Pan-German element seemed in no-wise diminished. Many statements were made in regard to the minimum that Germany would accept which involved German imperial rule over an extremely large portion of the earth's surface. The number of German articles on world policy was beyond calculation. In regard to the question of alliances some argued that if Russia chose England as her friend, in the long run the world policy of Germany would be confined to a very narrow sphere and the prospect of future conflict was almost certain. An ultimate coalition of Germany, Russia, and Japan was put forth by some as the only way of destroying the British Empire. Such a coalition would of course mean simply another union for the purpose of dividing up the map of the world, but it was argued that that process of opinion would be continued anyhow and that German acquiescence would not check the aggression of others. With the Russians and Japanese on one side and the Germans and German Turks on the other it was argued that English power in the Middle and Far East would be destroyed. As an illustration of this sort of speculation the following passage may be quoted from an article on ways and aims of world policy in the *Cologne Gazette*: "If we are able to overthrow the British and thus to render Russia and Japan decisive service in Asia against England we ought to be able to obtain permanent recognition of our Turkish and Near Eastern policy, and to make the western edge of the Persian mountains the frontier between the Quadruple Alliance's sphere of interest and Russia's sphere of interest."

See *WAR OF THE NATIONS, The Diplomacy of the War; Military Operations, Naval Operations; Aërial Warfare*. See also *FINANCIAL REVIEW; FOOD CONTROL; NAVAL PROGRESS; PROSTITUTION; STRIKES; SUBMARINE OPERATIONS*.

**GIBRALTAR.** A narrow peninsula extending southward from the southwest coast of Spain, commanding the entrance to the Mediterranean; a British crown colony, naval and

coaling station, and entrepôt of the British trade with the Barbary States. Area,  $1\frac{1}{2}$  square miles; population, exclusive of the military, 17,943 in 1916. Practically a free port, it has no trade returns. Revenue (1913), £104,634; expenditure, £82,077; total tonnage entered 1915, 7,157,837 (4,239,536 British). The customs revenue in 1915 was £37,250. The Rock of Gibraltar (*Mons Calpe*) was captured by the British in 1704 from the Spanish kingdom of Granada, and in 1713 was formally ceded by the terms of the treaty of Utrecht.

**GIFTS AND REQUESTS.** The benefactions to charitable, religious, educational, artistic, and patriotic objects in 1917 exceeded those given in any previous year. It is probable that the entire amount exceeded \$1,000,000,000. In the totals given below, the contributions to war relief are only those which have been distributed through the chief agencies in the larger cities. If to these were added the direct contributions, and the immense value of supplies, the total sum would be greatly increased.

The total amount given during the year, according to the records kept by the *Chicago Tribune*, totaled \$815,654,044, divided as follows: to charity, \$729,124,497; to education, \$39,597,797; to religious organizations, \$19,707,438; to artistic associations, \$21,975,710; and to libraries, \$5,259,500.

The largest donations of the year were as follows: to the Red Cross, \$114,000,000; Rockefeller Foundation, \$103,894,409; John D. Rockefeller personal gifts, \$70,000,000; war relief funds through New York City Agencies, \$52,221,000; Y. M. C. A., \$51,722,580; Jewish War Relief, \$17,500,000.

Among the large individual donations was one of \$15,000,000 from Isaac D. Fletcher willed to the Metropolitan Museum of Art in New York City. J. P. Morgan also gave \$7,500,000 to the Museum. Rosaline P. Coleman, of Lebanon, Pa., left by her will \$6,000,000 to charity. John D. Rockefeller, Jr., gave to various objects, \$5,200,000. Andrew Carnegie's contributions during the year amounted to \$3,150,000. Miss S. B. Harkness, of New York City, gave to Yale University, \$3,000,000.

In the following list, sums less than \$5000 are not recorded.

Abraham Lincoln Center, gift from Edward Morris family, Chicago, Ill., \$207,500; other donors, \$87,000.

Actors' Benefit, Chicago, Ill., \$5000; will, John Hoge, Zanesville, Ohio, \$500,000; various donors, Chicago, Ill., \$7000.

Administration Bureau, gift from Rockefeller Foundation, \$9820.  
Aero Club, New York, will, Samuel H. Valentine, \$10,000.

Albany Hospital, gift from George F. Baker, New York, \$25,000.

Aldrich, James H., Manhattan, N. Y., will to charity, \$41,500; will to church, \$25,000.

Allegheny Memorial Hospital, gift from Singer heirs, Pittsburgh, Pa., \$250,000.

Allentown, Pa., various donors to hospital, \$50,000.

Allied War Relief, gift from Carnegie Foundation, \$500,000; gift from Kidder, Peabody and Co., New York, \$100,000.

Alma College, Alma, Mich., gift from Jay Clisbe, Alma, Mich., \$6000.

Alms, Eleanor C., Cincinnati, Ohio, will for park purposes, \$50,000.

Altoona, Pa., various donors to Y. W. C. A., \$50,000.

American Ambulance Corps, gift from R. W. Goelet, New York, \$250,000.

American Baptist Foreign Missions, gift from Rockefeller Foundation, \$75,000.

American Bible Society, gift from unnamed donor, New York, \$25,000.

American Red Cross, gift from Jacob H. Schiff, New York, \$100,000.

American Unitarian Association, will, Horace Davis, Berkeley, Cal., \$75,000; will, Mary A. Evans, Boston, Mass., \$100,000.

Amherst College, Amherst, Mass., will, Samuel H. Valentine, New York, \$5000.

Amherst, Mass., gift of library from Edward C. Conners, \$250,000.

Anabacher, Adolph B., New York, will to charity, \$15,000.

Apperson, J. P., Portland, Ore., gift to Oregon Agricultural College, \$25,000.

Aquarium, San Francisco, Cal., gift from Ignaz Steinheart, San Francisco, Cal., \$100,000.
